Mrs. Teape is now in New York City, arranging for the details of this longest trip ever undertaken by women autoists, and is quite confident that she and her daughter will not only make the trip successfully, but she has mapped out a schedule which should land them on the Pacific Coast at the end of eight weeks. This is considered remarkable, in view of the difficulties encountered by the New York-Paris contestants, though the women drivers will not be hampered by snow and ice. But that Mrs. Teape knows the country and how to cover it, is evident from the fact that she drove a 4-horsepower Waltham buckboard from Chicago to Denver last year in two weeks.

"I am enthusiastic regarding the trip," said Mrs. Teape, when seen at her hotel, "and I feel sure we can make it successfully. I realize the difficulties that two women may encounter, but we have always lived in the West and have plenty of confidence in our ability to overcome every one of the trials and obstacles that may beset us on the long trip. We shall not be bothered with extra equipment or baggage to hamper us, for, as some one has very wisely said, 'the greatest hampers to motorists are the hampers they carry with them.'"

Archie Hughes and His General Utility Pierce Great Arrow Showing the Way, Followed by J. E. Mountain's Clean Score Winton.

NORRISTOWN, PA., May 2.—Nearly 50 per cent. of clean-score cars—15 out of 32 official starters—tells the story of last Tuesday's initial endurance run of the Norristown Automobile Club. The road conditions were ideal and the schedule a trifle too easy for a vital test of the relative merits of the cream of the American automobile industry. Yet the very ease of the going was an inducement to speed which subjected all the cars to a severe pounding over the thank-you-ma'am roads of Montgomery and Lancaster counties. That such a large proportion came through without a semblance of a cause for the imposition of demerits, speaks volumes for the sturdiness of the American product. The redundancy of clean scores proved a thorn in the sides of the contest committee, which, at a meeting Friday night to consider the situation, at which the bulk of the clean-score entrants were present, it was decided not to have a run-off, as originally intended, but to melt down the handsome cup and strike off medals, to be given to each of the successful entrants and drivers.

The contest committee tried a scheme to block the usual piling up process at controls, and it worked like a charm. They adopted a rule which read: "Between checking stations each car may stop for a total elapsed time of five minutes, and no more, without penalization, provided no repairs or adjustments of any kind whatsoever (except replenishment of supplies) are made during the elapsed time." The result was that each driver had to have a coach, who, watch in hand, hauled him up when he neared a control ahead of time. It was a novel sight to see a dozen or more cars loafing along in an effort to consume time. As a result most of the cars came up to the mark and were sent away again within a very few minutes, and at no control except that at Lancaster were more than three or four cars to be seen at any one time. At the last-mentioned place the schedule called for a two-hour dinner stop, the first car being sent away on the afternoon lap at 1 o'clock sharp.

Some other novelties in the rules were those allowing but one man at a time on a repair job; prohibiting the stopping of motors at intermediate controls (excepting the dinner stop); and the covering and sealing of speedometers. Checking stations were established at the start and finish at the Hotel Montgomery, Norristown; Stephen House, Coatesville; Wheatland House, Lancaster; Mansion House, Reading, and at the Schuler House, Pottstown. The route led through the Pennsylvania Dunkard country, and, when the cars began to skin through a town, the brethren and sisters were prop-

erly excited, and knocked off work to a man and woman until the last car had passed. And perhaps some of those sanctimonious-looking brothers aren't motor-wise! It was really startling to hear the bunch at Ephrata shout out: "Here comes a Pullman!" "There's a Pierce Arrow!" "That one that just passed was a Pope-Toledo!" It's safe betting that not a Dunkard in the entire section owns a car, but they know 'em when they see 'em just the same.

The press people had the time of their lives. They were consigned to the care of Archie Hughes, of Glidden tour fame, who kindly offered the services of himself and his big Pierce Great Arrow Six to the committee. Starting from Norristown among the last, Archie took upon himself the task of Good Samaritan, first-aid-to-the-injured, and general all-around errand boy. When the driver of car No. 1 was put down and out by a side-swipe from No. 3 while engaged in fixing a puncture, Hughes was on the job instant, and, after helping to get the injured man on his car again, he ran back to the railroad station to pick up a member of No. 1's party, who had gone to telephone for a physician. Articles dropped on the road by the hurrying contestants were retrieved by the press contingent, who readily entered into the spirit of the self-sacrificing game. When No. 5's commutator went to the bad, Archie happened along a few minutes later, and, after helping to fix the stalled car comfortably for the night, he piled the careless folk in among the pressmen's legs and brought them home. And, notwithstanding the numerous self-imposed delays, all the controls were negotiated by the Pierce Arrow well within the official schedule.

Of course, there were hard-luck stories. One of the most

*Originally returned clean-score, but was protested for stopping motor after accident with driver of No. 1. Protest sustained.
 †Excessive road penalty due to observer's misunderstanding of rules.

At the Lancaster Control, in Front of the Wheatland House.

The Stop at the Official Control, Manson House, Reading.

heart-breaking experiences was that of S. E. Ballard, who cleaned his Franklin-12 till almost within sight of home, when his commutator went to the bad, and the car had to be abandoned. R. A. Jackson, who drove No. 21, a Mitchell, dropped his license tag in the road, and suffered two demerits when he stopped his car to rescue it. They were, however, lifted afterward by the committee. While entering West Reading, Martin

Leinan, driving No. 30, a 30-horsepower Acme, skidded at a sharp turn and plunged up the bank into a three-rail fence, breaking a front wheel off clean. Thus another clean score went a-glimmering. Reading is the Acme's home town, however, and a 'phone message soon brought assistance from the factory, and the wrecked car was towed there and repaired. It resumed its journey at 6 o'clock and reported at the finish about 8 o'clock.

DE DION SAID TO HAVE HAD ENOUGH OF ROUND-THE-WORLD

ACCORDING to a cable from Paris to the *New York Times*, the only French car now remaining in the New York-Paris contest will probably be withdrawn on its arrival at Vladivostok, instead of continuing through Siberia, in accordance with the recent change of plans. This is the De Dion, which is now in Japan, en route to Vladivostok, and it is understood that it will not continue the race from that point. A declaration is expected to this effect from Marquis De Dion. This will leave the Thomas, Zust, and Protos to continue across Siberia. As things stand at present, the French and Italian cars are in Japan and are expected to reach Vladivostok this week; the Thomas is on the *Shawmut*, due to arrive at Yokohama May 8, and will probably reach Vladivostok May 12 or 13, while the German Protos

car is on the *General Logan*, bound direct for Vladivostok, and is expected to reach there on or before May 15.

It is expected that a time allowance plan will be worked out in order that the three cars in question may continue the race. The Thomas, which will be in charge of George Schuster, will be allowed the time it led the Zust when it reached Seattle, the furthest point mutually reached by the two cars on the original route. It is understood that the Protos will not be disqualified as the result of having been shipped from Ogden to Seattle, but will be handicapped the amount it was behind the Thomas at Ogden, as well as the time consumed in running from Ogden to San Francisco by the latter. No official decision has been announced as yet, but it is thought that this step will be taken.

AUTO SPORT TO AND IN THE DELAWARE GAP

PHILADELPHIA, May 3.—The *Public Ledger* of this city is interested in a four days' auto carnival which will be held in the Pocono region during the last week in June. To carry out the project an organization known as the Monroe County Automobile Association has been formed, with Dr. C. M. Brownell as president and A. F. Everitt, of Stroudsburg, Pa., as secretary. The object of the carnival is the exploiting of that beautiful mountain region with a view of attracting there the automobile element, not alone of Philadelphia, but of New York as well. Certainly there are no more charming spots within five hours' ride of either city than the Pocono region affords; nor better roads; nor better nor more numerous hotels.

To attract the denizens of the big cities, the new association has proposed this four days' carnival, which will begin with a sealed hood reliability run, starting from New York and Philadelphia simultaneously, and winding up at Stroudsburg. The second day will be taken up with a hill climb for numerous classes over a stiffish hill the committee has in mind overlooking the picturesque Delaware Water Gap. For the third day there will be short distance climb trials over a perfect stretch of road near Mount Pocomo, with a mile for getting up speed and an equal

length of road beyond the finish—a bit of road which, given the machines, will produce world's records. A gymkhana, with all the stunts such affairs bring forth, will make up the final day's program. This will be held on a half-mile track outside of Stroudsburg, which town will be during the week the center whence the visitors will radiate to get to the spots where the various events are to be held.

Allied with the Pennsylvania Motor Federation, and hence with the A. A. A., the Poconoers will do everything officially and up to the handle. Committees are already at work, support has been assured, many factory people and agency managers have been interested already, and prospects seem good for a most successful carnival.

WILKES-BARRE CLUB POSTING SIGNS.

WILKES-BARRE, PA., May 4.—There are so many winding roads around this city, and so few of them are familiar to visiting motorists that the Wilkes-Barre Automobile Club has just undertaken the task of marking them with sign posts within a radius of fifty miles. Both directions and distances will be given.

Thomas-Forty Trio of Clean-score Performers in Detroit Trade Association's 450-mile Endurance Run.

THIRTEEN CLEAN SCORES IN DETROIT'S THREE-DAY RUN

DETROIT, May 4.—With the three days' endurance run just completed still fresh in mind, the Detroit Automobile Dealers' Association is seriously considering holding a non-stop contest over the same course in the near future. Enthusiasm runs high among those who took part in the endurance run, nearly, if not all of whom would be entrants in the event of a non-stop race. Other well-known drivers have expressed a willingness to enter, and the success of such an undertaking seems assured.

Last week's three-day gruelling contest provided some good sport, and likewise proved a revelation in several respects. The course was triangular, with Saginaw as the first day's destination, Kalamazoo the second, and the return to Detroit occupying the third, the entire distance traversed being 419 miles. Thirty-two cars, ranging all the way from a Brush runabout and a single-cylinder Cadillac up to the ponderous six-cylinder, were entered, and of this number thirteen finished with a perfect score, four others having less than ten points marked against them. Not the least satisfactory feature of the contest was the showing made by the light cars. The absence of perfect scores in this class does not accurately reflect conditions, penalization in nearly every instance being clearly traceable to the fault of drivers and not to mechanical defects. As was expected, many of the heavy cars romped through the course with time to spare, although at numerous points careful driving was necessary.

The roads in spots were abominable, and rain and snow, accompanied by a biting wind, added to the general discomfort. West of Saginaw fifteen miles of the worst roads imaginable were encountered, and here numerous penalizations occurred. A Cadillac touring car, while leading the procession through a quagmire, with mud and water hub deep, suddenly struck a buried tree lying horizontally across the road. After a struggle, the front wheels were forced over this, only to strike another log. Then a third was encountered and surmounted, but a buried stump

standing upright proved the undoing of the car so far as a perfect score was concerned. As the car plunged into the mud after hurdling one of these logs one of the parallel steering rods hit squarely on top of the stump, being bent out of all shape, and necessitating putting in a new one. With water five feet deep on either side, a long string of cars was held up for an hour while repairs were made.

The incident furnished a little excitement that was not on the regular program, the Thomas "Snowbird" making the course on high gear as a non-contestant, deciding to take to the railroad track and avoid delay. Hardly had the track been gained when a passenger train rushed down from the rear. For a mile there was a lively race between the steam and motor cars, the "Snowbird" reaching a crossing and safety just a nose ahead of the locomotive.

A Cadillac runabout gave an exhibition of running power that was unique. On the second day out it struck an imbedded stone, tearing out both brakes and putting the low gears out of commission. Then followed a performance that would put a crab to shame. Every time a hill was encountered the car was turned around and backed to the top, made another turn and continued on its course. The absence of brakes made this a ticklish proposition, but it was safely accomplished a dozen times, the car finishing with a score of 995 points.

If it answered no other purpose, the endurance run would have been worth while because of the boost given the good roads movement. Much of the course was good, but there were long stretches where the highways were rendered well nigh impassable by spring rains, and where a course had to be picked through mire in many cases hub deep. Farmers along the road displayed a keen interest in the event, and were, as a rule, friendly, one exception being a weazened old ruralite who, armed with an ancient shotgun, mounted the fence and announced his determination of shooting the first man who killed one of his chickens.

Northern Participants in Detroit Endurance Run—Two Were Two-cylinders and One a Four-cylinder.

Three opportunities were afforded, but the old man proved a poor marksman, and the motorists escaped unscathed.

Owing to the number of perfect scores, the silver loving cup offered will remain in the possession of the Detroit Automobile Dealers' Association, the names of those with perfect scores being engraved thereon. The entries and points scored are as follows:

No.	Car	Driver	Points
8	Franklin	Davis	1,000
9	Thomas	Grant	1,000
14	Peerless	Bemb	1,000
15	Northern	Chapin (E. J.)	1,000
19	Maxwell	Kelsey	1,000
20	Thomas	Mocheaky	1,000
23	White	Sheridan	1,000
26	Northern	House	1,000
27	Pierce-Arrow	Day	1,000
28	Oldsmobile	Aubel	1,000

FIVE MILE SPRINTS ONLY AT BOSTON.

BOSTON, May 5.—Preliminary announcement of the events to be contested at the annual Memorial Day meet of the Bay State Automobile Association, to be held at Readville track, gives promise of some interesting sport. With one exception the races are all at five miles, it being the idea of the committee to provide snappy racing with close finishes. There are seven events in all, five for automobiles and two for motorcycles. The automobile events are as follows:

1. Five miles, open to stock gasoline touring cars, from 24.1 to 40 horsepower.
2. Five miles, open to stock gasoline touring cars from 40.1 to 60 horsepower.
3. Five miles, open to all gasoline runabouts irrespective of horsepower.
4. Twenty miles, open to stripped stock chasses.
5. Five-mile handicap.

The motorcycle events are: 1. Five miles, open to single-cylinder machines. 2. Five miles, free-for-all.

The committee considered the question of holding a twenty-four-hour race or some long-drawn-out contest, but decided that a more successful meeting could be held if the events were made short.

S. L. Haynes, of the Springfield Automobile Club, has been appointed referee by the racing committee, which consists of Harry W. Knights, Massachusetts member of the A. A. A. racing board; Charles E. Fay, manager of the Ford branch, and John L. Snow, manager of the Peerless branch. The entry blanks are being prepared and will be sent out this coming week.

SEVENTEEN PERFECTLY SURVIVE MARYLAND ENDURANCE RUN

BALTIMORE, May 4.—The first sealed bonnet contest to be held in Maryland took place last Saturday, and seventeen of the thirty-four cars entered completed the trip with perfect scores. The owners of each of these cars will receive as prizes handsome silver cups from the Baltimore News, under whose auspices, together with the Automobile Club of Maryland and the Baltimore Dealers' Association, the contest was held. The route was from Baltimore to Hagerstown, through the Blue Ridge mountains and over the roughest roads within the State, and return, a distance of 147.8 miles. In order to have a perfect score, it was necessary for the cars to complete the trip within twelve hours, without making any repairs otherwise than to the tires.

The first car started promptly at 6:30 o'clock Saturday morning, and was followed by the other cars at intervals of one minute apart. The cars that did not finish within the scheduled time returned either with broken cranks, seals, springs, rods, axles, etc. The Packard-30, driven by W. E. Baker, had to make seven changes of tires, while the Thomas-40, driven by W. H. Gill, made two such changes. In making one of these changes in the mountains, while pulling a steep grade, the Thomas narrowly escaped colliding with the Oldsmobile, driven by A. L. McCormick, which stopped suddenly on the grade and started to descend the hill. A slight collision occurred between a Mary-

land-26 and a Thomas-60 car at Flint Station, on the Western Maryland railroad. One of them had made a wrong turn and was backing.

To make the task of the drivers more difficult, a heavy rain and windstorm broke over them on the return trip. The clouds were so heavy that the men could see but a short distance before them, while on the turns the cars skidded, and many accidents were narrowly averted. The route of the contest was from Baltimore to Westminster, to Taneytown, to Emmittsburg, to Lanz, to Foxville, to Cavetown, to Hagerstown, and then to Middletown, to Frederick, to New Market, to Ridgeville, to Ellicott City, to Baltimore. Cars with perfect scores were:

No. of Car	Name of Car	H.P.	Driver
8	Ford	15	R. F. Kaehler
7	Oldsmobile	35	A. L. McCormick
11	Thomas	40	H. W. Gill
14	Winton	48	T. C. Goodwin
15	Packard	30	H. Hardesty
16	Thomas	60	E. F. Coley
17	Welch	50	Kelly
20	Pierce-Arrow	40	D. A. Clark
24	White	30	Lee Tremblay
25	Packard	30	William Keyser
27	Royal Tourist	45	P. R. Reese, Jr.
31	Packard	30	W. E. Baker
32	Franklin	28	W. Graham Hall
33	Bulck	22	"Jack" White
34	Cadillac	20	L. M. Foster
35	Locomobile	40	Florida
9	Autocar	12	B. F. Gooden

MINNEAPOLIS WILL HAVE 300-MILE RUN.

MINNEAPOLIS, MINN., May 4.—On May 29 and 30, the Minneapolis Automobile Club will hold a 300-mile endurance run under the rules of the American Automobile Association. Col. Frank M. Joyce, president of the Minnesota organization, has received notification from more than twenty-five auto owners that they will enter the contest. The contest will be under the direction of judges from the outside. The start will be made from Minneapolis and the machines will proceed to Mankato, Minn., and return, and then from Minneapolis to St. Cloud and return, the complete trip totalling 300 miles.

SOLDIERS TO GUARD BRIDGEPORT CLIMB.

BRIDGEPORT, CONN., May 4.—Details of the preparations for the annual Decoration Day climb up Sport Hill were made known and approved at a meeting of the Automobile Club of Bridgeport, held last week. A. L. Riker, who will be the referee, reported that there would surely be a big field of entries, and that he had received from Walter C. White a promise to be a contender with his White steamer, which won the recent free-for-all cup at Fort George. The course will be guarded by the Fourteenth Company, Coast Artillery Corps, C. N. G., under Capt. George E. Hans. Ten deputies will serve as signalmen.

HUNTING FOR THE ELUSIVE IGNITION CURRENT

By CHARLES B. HAYWARD.

IF a census of the automobile literature of the "How-and-What-to-Do" kind that has appeared since the beginning of the period when men who are neither mechanics nor electricians undertook to master the intricacies of the self-moving vehicle could be compiled, it is safe to say that it would show a great preponderance of advice on the subject of ignition troubles. Electricity has always formed one of the profoundest mysteries of everyday life to the man in the street, so that it is hardly to be wondered at that most of the "Helping Hand" contributions should deal with this subject. But as it is one of those things that cannot possibly be covered in less than a good sized volume, and as there are always new things to be learned about it and endless newcomers in the field of automobiling to learn them, the reason for making it a constantly recurring theme is plain.

Percentage of Ignition Trouble Is High.

As is the case with everything else, it is the little things that count. Seldom, indeed, is the average autoist held up on the road by a broken axle, a smashed frame, or anything of so serious a nature. Inability to start the motor suffices to cover a multitude of road troubles in a few words, and of this host more than half are directly traceable to the defection of some part of the ignition system of the car—usually of a trivial nature. Until he reaches the point where he begins to realize that this most vexatious of misfortunes to the novice—failure to start—does not necessarily imply anything seriously wrong, the newly-fledged autoist is apt to regard an involuntary stop as meaning anything from a broken part up to an utterly ruined motor. But with even a little experience comes appreciation of the fact that minor worries are vastly in the majority, and that a broken battery connection is just as certain a means of bringing a car to a stop as a broken connecting rod, and very much safer. In the earlier days of their automobiling education many are apt to fear troubles of the latter sort and to look for them apprehensively when the car decides that it has gone far enough for the time being, regardless of the desires of its owner.

Such mishaps are not alone of very rare occurrence, but when they do happen to fall to the lot of an unsuspecting driver, there is never the faintest doubt of the serious nature of the accident. In other cases, it is chiefly the doubt of just what may constitute the cause of the trouble that is most vexatious. As the driver of Teutonic origin put it, meanwhile scratching his head in a most perplexed manner, "*I don't find my spark anywheres, and I have looked him all over.*" The relative importance of the trouble is trivial compared with the difficulty that is encountered in locating it. Experience has shown it to be harder to confine a high-tension current within proper limits than it is to prevent leaks in a high-pressure compressed air system, with the further difference that the electric leak is not often so obliging as to visibly, or audibly, reveal its presence.

Compiling a Breakdown Chart for Reference.

Many reference lists have been compiled for the aid of the trouble hunter, and a study of one of these statistical compilations of ailments will often prove of considerable assistance to a beginner. Their chief shortcoming is to be found in the fact that it is impossible to make any general set of recommendations apply to every case in particular, and, for that reason, the driver himself should see to it that he gets such things, and especially the order of their importance, well fixed in his mind, concerning his own car. I have often heard the question asked: "What goes wrong oftenest?" Applying this to the ignition system of a car, where of the usual battery and coil high-tension type, the enumeration might be started in the order of: first, timer; second, coil vibrators; third, wiring; fourth, spark plugs, and so on, this list presupposing that the battery is known to be in good con-

dition. In whatever order such a list be compiled, there can be little question but that the timer and vibrator will figure most prominently in it, and the degree of merit of each one of these devices will determine whether they are to rank first or second in the order of prominence as trouble makers.

To cite instances of ignition trouble that bother old hands for quite a few hours in their solution, would not be an extra difficult matter, but this is one that defied the combined efforts of several self-styled experts to unravel, and even then its solution was more or less of an accident. The chief difficulty usually lies in the fact that the symptoms are so misleading that one is quite certain they point to something other than what eventually is discovered to be at the root of the matter. This was the case in the instance under discussion which puzzled every one of a crew of five most sorely. First the motor came to a stop, and the manner in which it did so pointed to ignition trouble, for there is considerable to be learned from the action of the motor in this respect. Resort was had to the crank by one of the crew before any of the others could do any conclusive investigating, and the motor started on the first turn. It continued to run until every one of us had had a good opportunity to stretch and get comfortably settled back in the car, and then the motor gave up the ghost again.

Symptoms So Often Prove Misleading.

This action of the motor gave rise to a difference in opinion as to the cause, and the diagnosis of ignition trouble arrived at as a result of the manner of the first stop, was considerably shaken. "Looked as if there were an obstruction in the gasoline feed line and the fuel is only coming through in small quantities, not fast enough to keep the motor running steadily," ventured one.

"Loose contact somewhere," tried another, each one trying his hand at a slightly different diagnosis.

But it is one thing where the motor resists all attempts to start it by cranking, and quite another where it will yield to this treatment. Turning the motor over on the crank was rewarded with a fresh start practically every time, but the period for which the motor continued to run varied from a few minutes to half an hour. There was no telling when it would give up the ghost, and as the party was desirous of getting somewhere, the annoyance of having to go trouble-hunting every few miles, and sometimes every few minutes, was exasperating. It was only by finally assigning each man a duty, thus instituting a systematic search, that the trouble was finally remedied.

While one man cranked to start the motor, and stood there to repeat the performance should it stop, another watched the timer minus its cover, a third kept tab on the carbureter, and still a fourth watched the vibrators of the coils. After two or three short runs that revealed nothing, the motor got under way and began to run so steadily that the trouble seemed to have disappeared of its own accord.

Fortunately, the watcher at the timer stuck to his post and noticed that it came to a stop shortly before the motor did. Cleaning out the case by flushing it with gasoline revealed the fact that the contact, which was ordinarily held to the vertical shaft by means of a set screw, had become loose. The holding screw had backed out just enough to permit the shaft to pick up the contact at times and hold on to it for a little while, then letting go. As the motor was turned over slowly by hand the contact seldom failed to be picked up, which accounted for the easy starting of the motor, while speeding the latter up was most often responsible for dropping it again.

Why it continued to hold at times and utterly refused to stick at others is one of those mysteries that only the erratic action of a machine out of adjustment can account for. About three

turns of the screwdriver sufficed to remedy what had taken hours to find. Instances of this kind could be multiplied indefinitely, and probably there are few autoists who have not puzzled over an apparently mysterious source of trouble for a long while, only to discover ultimately that it was so simple as to be childish.

Ignition and Carbureter Faults Sometimes Similar.

It was only natural that in the foregoing case the trouble should have been confused with a stoppage of the fuel system, as the symptoms were very much similar to those that are apt to occur when the fuel line becomes partly stopped up and does not permit enough gasoline to pass to keep the motor running at its usual speed. As soon as it has been stopped a few minutes, sufficient filters past the obstruction to render a new start possible, and as soon as this fuel is exhausted, the motor stops again to await a new supply. The same thing might be said of the battery, where dry cells are used, as it is well known that

they will recuperate sufficiently to run a motor within a very short time, even though they may have appeared to be absolutely dead but a few minutes previous.

Plugging of the carbureter jet by means of some obstruction that did not stick tightly in the nozzle opening, but which at times was drawn up into it, and at others fell back into the tube, would have been productive of similar symptoms, and was looked for in the case in question, but without result. So also were hidden causes of some intermittent short-circuit, similarly investigated, as the vibration of the motor's running will often permit the trouble being caused by a bad place in the wiring to go unnoticed, by keeping it away from the part with which it is making contact at times, and at others forcing it into that relation.

Road shocks are also guilty of doing the same thing, though this form of trouble is rare on the modern car, owing to the care taken not to use a superfluous inch of high-tension cable, and to protect every part of it over the motor.

AMERICA SEEMS TO BE BUYING MORE FRENCH AUTOMOBILES

PARIS, May 1.—America continues to increase her imports of French automobiles, and Russia, Spain, Turkey, and Algeria buy more French cars than formerly, but this is not sufficient to prevent a serious drop in exports, as shown by official figures for January, February and March, just made public by the Customs and Finance Department.

The total French shrinkage is \$1,166,000 for the period under review, and of \$800,000 for the corresponding period of 1907. The figures given are for automobiles only, motorcycles and their parts and bicycles and parts being classed separately. A diminution amounting to almost \$600,000 a month is of such a serious nature as to cause some alarm among French automobile constructors. It is generally recognized that England is not likely to very greatly increase its imports, the tendency indeed being to establish branches of French factories in that country, and although American business has increased of late those acquainted with international affairs know that only the limited high-class business can be held by France.

Some authorities are rather pessimistic over the figures and predict a loss of \$6,000,000 on the year compared with the trade of 1907. Such is not likely to be the case, however, and wrong conclusions will be arrived at by taking January, February, and March as an indication of the trade of the entire year. The closing months of 1907 were exceptionally bad and to judge from present indications there will be an increase in business this year which will bring the total figures within reasonable distance of those of last year. Certainly 1908 will not equal 1907, but there does not appear to be any real reason why it should not be as successful as 1906.

Relief from the gradual shrinkage of French exports is generally considered to lie in the encouragement of trade with countries that have up to the present paid little attention to the automobile. France is making strong efforts, for instance, to

capture the Russian market, is striving to extend business in Algeria and Spain, and has an eye on the South American republics. Very much, too, might be done in the development of the home trade, France having a smaller number of automobiles in use than either England or America.

In the following table, compiled from the official returns, the volume of French exports of automobiles for the months of January, February, and March, 1907 and 1908, are shown in comparative form. In addition, the two last columns show either the increase or decrease on the first quarter of 1908 compared with the corresponding period of 1907:

	1907	1908	Increase	Decrease
Great Britain	\$3,375,400	\$2,610,800	\$764,600
United States	528,600	749,000	\$220,400
Germany	675,800	463,400	212,400
Belgium	665,400	252,400	413,000
Argentine Republic. . .	340,200	248,800	91,400
Algeria	197,800	214,200	16,400
Spain	109,200	155,400	46,200
Brazil	194,800	133,200	61,600
Russia	43,600	126,000	82,400
Italy	269,000	108,800	160,200
Switzerland	185,600	60,600	125,000
Turkey	8,600	41,400	32,800
Austria	35,600	13,400	22,200
Other countries	1,007,800	784,600	223,200
Total	\$7,637,400	\$5,962,000		

French imports of automobiles, motorcycles and bicycles show a slight increase for the first quarter of 1908, though the total is so slight that it is hardly worth considering. In January, February and March, 1906, France received foreign automobiles to the value of \$340,000; for the corresponding three months of 1907 the amount had dropped to \$326,200, and for the first quarter of the current year it had shrunk to \$273,000. Foreign motorcycles and parts were imported to the value of \$800 during the three months, compared with \$1,200 for the corresponding period twelve months earlier.

INDIANA IS BUYING AUTOS PLENTEOUSLY.

INDIANAPOLIS, IND., May 4.—There were 309 automobiles registered with the Secretary of State during April, the largest number in any one month since last July. This brings the total number of automobiles and motorcycles in the State to 5,734, of which about 200 are motorcycles.

A glance at the registrations indicates that by far the greater part of the business this year has been in low and medium-priced runabouts, with a fair representation of high-wheeled motor buggies. Quite a number of more expensive touring cars have been sold, however, and indications are that the 1908 season will be a record breaking one in Indiana.

WHERE FARMERS OWN THE AUTOS.

CRAWFORDSVILLE, IND.—This city will have its second annual automobile day on May 19, and several hundred visiting automobile owners from neighboring cities are expected to attend. A committee of business men has been successful in obtaining substantial cash contributions, which will be used as prizes for a number of events. There will be an automobile parade, followed by exhibitions of driving and novelty races, for which a fine list of attractive prizes are offered.

Crawfordsville is in the center of a rich farming district, the majority of automobiles owned in the county belong to the agricultural portion of the population.

LETTERS INTERESTING AND INSTRUCTIVE

HOW CAN CYLINDERS BE GROUND BY HAND?

Editor THE AUTOMOBILE:

[1,342.]—I wish to inquire through your most valuable paper if you or any of our readers know of any way I can grind a pair of imperfect cylinders and get good compression. I bought a new air-cooled, double-opposed engine, 4x4-inch, and the cylinders did not have a very good compression from the start. I looked the piston and rings over and found they were in good shape and a good fit, but the cylinders are off just enough to leak very badly.

Now, the question is, can I, while running the engine on gasoline, use either rotten stone or tripoli by placing it in the pipes (which are large) leading from the oil cups to the cylinders? In this way the grinding material will be fed to the piston with the oil, and in this manner gradually grind the cylinders; but will it grind only on the top and make matters worse, or will it grind the tight places?

I have a valve grinding paste, made by Brown & Co., of Syracuse, N. Y., which is quite mild and is a fine polisher. I think it contains no emery. Would you think it better to use it? If the above method is not a good one, could you or some of our readers tell me of a simple plan to overcome this difficulty?

Would it be better to remove the cylinders and pistons and grind them by hand with emery? This would be quicker, and one could see how things were coming. And then the emery could be washed off, so as not to get into the engine proper. As the engine is now it heats badly. One of the pistons was fitted just a little too tight, so when it gets hot it expands to the extent of causing friction, and this makes it heat very quickly. Do you think that this will wear to a fit and not get so tight, or had I ought to have it dressed down a little smaller?

I will be very much obliged if some one can help me out in the above matter, so I will not be compelled to send the engine back to the factory to be rebored.

V. R. LANE.

West Liberty, Ia.

It looks as if your troubles were due to having tried to save money on the first cost of a motor by investing in a cheap one. However, if the only fault to be found is that one of the pistons is a little tight, no grinding should be required. Motors selling at a very low price are naturally not given that attention in the way of finishing and testing that those selling for a much higher figure are. What your motor needs would seem to be running-in. Couple it to some other source of power and flood it with oil. Then run it steadily at a comparatively slow speed to prevent heating, for two or three days, when it should be sufficiently run-in to do away with the difficulty. We doubt if attempting to grind the piston into the cylinder by means of an abrasive would be all that was desired, but if any of our readers have ever made use of such an expedient, or have any suggestions to offer along this line we should be pleased to hear from them.

WHAT IS THE CAUSE OF THIS OVERHEATING?

Editor THE AUTOMOBILE:

[1,343.]—Will you please tell me the probable cause of my engine overheating? My pump gives a good circulation, but the water in tank gets to boiling point after traveling two or three miles. Jamaica, N. Y.

JOS. SYLVESTER.

Poor adjustment of the carbureter, which gives an over-rich mixture, is a very common cause of overheating, due to the fact that the charge continues to burn much longer than where it is of the proper proportions. It also develops a great deal more heat in burning, and a much greater proportion of this heat is necessarily absorbed by the cylinder walls owing to the greater length of time it takes to burn. Another cause of heating may be the fact that the fan belt is slipping, as some cars are so constituted that their motors will not run cool unless the fan, and, in fact, every other part of the cooling system, is working up to full efficiency.

Partial obstruction of the circulating pipes, or of the radiator, by deposits from the water employed for cooling, may also be cited as among the causes of overheating. The same thing applies to the jackets, which may be partly stopped up.

FROM AN ADMIRER OF LETTERS INTERESTING.

Editor THE AUTOMOBILE:

[1,344.]—Your department of "Letters Interesting and Instructive" is, to my mind, one of the most valuable features of your publication, and I would like to see ten pages of these letters instead of the three or four which usually appear. Do you limit the space of this department, or are correspondents few? Here are some questions on which I would be glad to hear from you and from the readers of this department.

I have a 1907 Pope-Hartford. After running it ten months, I recently dismantled the engine to tighten a slightly loose connecting rod, in doing which it became necessary to disconnect the magneto, the couplings of which were carefully marked before removal, as were also the terminals of all wires. There is no question that everything went back exactly as it was taken off. The timer was not disturbed. However, after connecting up, the engine refused to start, and was found to be firing with the valves open. Previous to dismantling it was firing from front to rear in the order 1, 3, 2, 4. After some useless experimenting, I took off all connections, and, regardless of former arrangement, commenced at the rear or No. 4 cylinder and wired up so that the engine now fires in the order 4, 2, 3, 1. The engine runs perfectly, but as the wiring terminals are all marked in accordance with the old arrangement, I know there will be trouble the first time the car goes into the shop. I would like to change back to the old order but do not know how. An alleged expert who looked at the wiring tells me that any other arrangement is impossible, and that the car could never have run when wired up as I know it to have been. It did run for ten months, however. What is the matter?

On account of rough and "wavy" roads, I have been thinking of equipping the car with shock absorbers, but am told by various chauffeurs that they are "very hard on the engine." None of them offer any explanation as to why such should be the case, nor as to just what they do to the engine. Is this a superstition or has it some foundation?

After carefully reading the discussions which have appeared recently regarding the merits of the four and six-cylinder engines, I am firmly convinced that while they are both all right, each is a little better than the other. But why does neither side say anything as to the cost of fuel consumed? Does, for instance, a six-cylinder engine consume more gasoline per horsepower-hour than a four-cylinder, and if so, why?

I want to add a motorcycle to my equipment, but notice only one make advertised in "The Automobile" and none in other similar periodicals. I suppose the other manufacturers are still in business, and would like to have catalogues and prices. Here is a chance for some one to make a sale.

H. J. BRYANT.

City of Mexico, Mex.

That there is no scarcity of material for this department will be evident from the number of correspondents who have written us post haste to point out an error made in a recent issue. This is also a certain indication of the widespread interest that is taken in these letters and the answers thereto. Hence lack of space is the sole reason for not publishing a greater number of letters weekly.

Regarding the trouble with your car, we find that you have the same habit of making assumptions that lies at the root of the trouble of most of our correspondents. You say "there is no question that everything went back exactly as it was taken off." If this could be proven to be the case, then there is something wrong, but doubtless you will find that it is an assumption of fact not supported by the reality. Your reference to the timer not having been disturbed, in connection with what you say about the magneto, is slightly ambiguous, particularly as you do not add whether you finally got the motor running right on the battery or the magneto. To remedy the difficulty take the magneto off again; take out the spark plug, or open the pet cock, and drop a piece of stiff wire through the hole of the first cylinder, so that the position of the piston may be learned. The valve covers should also be removed.

Turn the engine over by hand until the piston of the first cylinder is at the upper dead center, about to descend on a power stroke, which may be learned by watching the valves and the wire indicator mentioned. Take off the distributor

cover of the magneto and turn the shaft of the latter until the finger corresponding to terminal No. 1 is just making contact. Mesh the magneto pinion with its driving gear, and if they do not exactly engage one another a half tooth's movement forward or back to make them do so will be immaterial, as it will be compensated for by the advance lever. Try the motor with the magneto in this position, and if it does not give as good a result as can be expected disconnect again and move the magneto pinion one tooth forward or backward, according to whether advance or retardation is required, and try again. As the magneto is synchronized to the motor, getting it in step with the first cylinder, makes it so with the rest of the motor. The mistake you made in putting it on as described was in starting with the rear cylinder instead of the front.

We have never heard of this latest theory of the chauffeurs regarding the damage done to the engine by the shock absorbers, but were laboring under a very strong impression that quite the reverse was the case, as the use of a good shock absorber not only adds to the comfort of the passengers, but acts as a means of protection to both the motor and the entire transmission. It has this effect by checking the reflex action of the springs, which would otherwise bounce the body into the air after each obstruction taken at any speed, thus preventing the continued alignment of the transmission shafts and the crankshaft of the motor. It is evident that more or less extra strain is imposed upon them every time the various parts of the transmission are thrown out of line. The comfort of the drivers and mechanics in a great road race is not usually a matter that entrants are particular about, but few, if any, racing cars run without shock absorbers, simply for the purpose of saving the engine and transmission as much as possible.

Six-cylinder advocates maintain a discreet silence on the subject of fuel consumption, as it is a matter of common knowledge that "miles per gallon" decrease at a startlingly rapid pace with each addition to the size and number of the cylinders. Naturally the six-cylinder motor of an equivalent cubic capacity, or piston displacement, with a four consumes more fuel than the latter, owing to the extra parts to be moved, greater heat losses through cylinder walls, and other factors affecting its efficiency, and figuring this way naturally leads one back to the single-cylinder. The advantages of the six are usually conceded to compensate for the extra fuel required.

There are other motorcycle manufacturers in existence and there are also a number of agents for imported machines in this city, to whom we have given your name.

REGARDING THE ERRONEOUS DIAGRAM.

Editor THE AUTOMOBILE:

[1,344.]—In your answer to letter No. 1,319, regarding wiring cells for a single-cylinder motor, wish to say that I do not believe this diagram is quite correct, if I understand it right. As far as I can see, one wire is taken from the last carbon in each set to point No. 3 on the switch. It appears in the diagram that it would not make any difference whether you had a switch lever standing on points Nos. 1, 2, or 3. Supposing you have the switch lever standing on point No. 1, with the wiring as indicated in diagram, does it not appear to you that the current will pass through the wire from the carbon in set No. 2 through point No. 3 and further from point No. 3 to the carbon of set No. 1 and from there to the wire of point No. 1? Consequently, this would give a series of multiple connection on either one of the three switch points. If I am not correct I would be pleased to have you explain diagram further, as I think it would interest many of your readers.

ARTHUR BEIJER.

Phillips, Wis.

You are quite right about the wiring diagram not being accurate when taken in connection with the explanation given, as it shows the cells permanently connected in series-multiple and, as is called attention to here by quite a number of subscribers other than yourself, the effect of this

would be that turning the switch to any one of the points would give the same result. It was inadvertently omitted to state that the expedient of making the connection to point 3 of the switch was not to be undertaken until the cells were no longer serviceable independently, but even at that there are modifications of the method of wiring which would render doing this much simpler and more convenient. These are called attention to by subscribers in this issue, as will be seen by the letters following. It is gratifying to note that such a number of the readers of Letters Interesting and Instructive were so quick to detect this error and call attention to it. The manner in which the error is pointed out and the necessary corrections called attention to in the foregoing, as well as the following letters, show that the average autoist's knowledge is no longer the limited commodity that it once was, and that it must be respected accordingly.

EXPERIENCE WITH CORK AND OIL "DOPE."

Editor THE AUTOMOBILE:

[1,345.]—Referring to your answer to inquiry No. 1,319, in the April 23 issue, beg to say that wiring a diagram as published will not permit using each set of batteries alternately, for the simple reason that the two sets are permanently connected in multiple by the wires running from the carbon terminals to point No. 3 on switch. Thus the two sets would discharge in parallel, no matter whether switch lever was on point Nos. 1, 2, or 3. The timer was not shown in the diagram, but, of course, this essential could be located at either end of the circuit, so that the current would reach the ground return through the timer shaft. In regard to the switch connections, I would suggest that Mr. Carpenter wire his two sets of cells in the usual way; that is, as shown in the diagram, with the exception of the wire between the carbon poles and point No. 3. Then he could use either set separately, and when the cells become weak, they could be used in multiple by slipping a thin strip of brass under the switch lever so as to bridge points Nos. 1 and 2, and at the same time connect them to the lever.

Referring to inquiry No. 1,321, would say that I have had some experience with "dopes" for silencing gears, which may be of some benefit to Mr. Hall. Last summer I experimented on a badly worn and very noisy planetary transmission in an Olds runabout. First I tried mixing boxwood, or "jewelers'" sawdust, with oil, but the sawdust being heavier than the oil, was thrown to the outside of the case, owing to centrifugal force, and was found tightly packed around the rim when the transmission was opened. Then I hit upon the idea of using cork filings, and this material gave excellent results. The mixture was prepared by filing old corks with a very coarse file or rasp. The filings were then screened through a piece of ordinary window screening, the coarse pieces being rejected. The fine filings were mixed with rather heavy cylinder oil in the proportion of about one part by volume of cork to two or three parts of oil. When this mixture was used in the transmission, the gears made hardly any noise at all. One filing would last for several hundred miles, or until the mixture had leaked out around the shaft. As the cork would float in the oil, there was no danger of its packing, and the fine particle adhering to the gear teeth acted like "cork inserts," filling up the spaces between the worn teeth. I would certainly recommend the "cork" treatment to any one troubled with noisy gears.

ALLAN W. PATTEE.

Monmouth, Ill.

ANOTHER SUBSCRIBER TAKES THE ISSUE.

Editor THE AUTOMOBILE:

[1,346.]—As a subscriber to your paper, I have always been an appreciative reader of your "Letters Interesting and Instructive." However, I beg at this time to take issue with you in regard to your reply and wiring diagram in answer to No. 1,319, in the issue of April 23. While I do not wish to infer that the editor does not know how to make a series, or series-multiple connection, still his statements are at least quite misleading, and his diagram incorrect.

The diagram, taken by itself, shows two sets of four batteries connected in series, with the carbon terminal of the upper set connected to terminal No. 1, the lower set to terminal No. 2 of a 3-point switch. Also the carbon terminal of each set to terminal No. 3 of the switch. This last mentioned connection makes a series-multiple connection of the batteries when the switch is on either point No. 1 or No. 2. The diagram shows all permanent connections (all lines being full, not broken), and the text does not even infer that the connections to point No. 3 are of a temporary nature, to be made only when the series-multiple connection is desired.

Why provide a three-point switch? Why not use a two-point

switch, and connect the carbon terminals with an ordinary battery connector when series-multiple connection is desired, or provide no switch at all if the coil box has a two-point switch, which it probably has in nearly all cases.

While I appreciate Mr. Carpenter asked for a battery wiring diagram for a single-cylinder motor, your reply was for the benefit of your subscribers, which a majority no doubt are more definitely interested in multiple-cylinder engines. The principal part of the diagram, i.e., up to and including the switch, applies equally as well to a two or four-cylinder as to a single-cylinder engine, still you do not intimate this. If the readers know little or nothing about connecting batteries, they would not know this, and if they understand connecting batteries your article is of no value to them. Please do not think me too critical, but I first noticed this article in "Motor Age" and considered making a reply. Later read it again in "The Automobile," and was again seized with the desire to reply to it. On comparing the two articles I find they have the same author.

W. A. YOUNG.

Muskegon, Mich.

HOW THE WIRING SHOULD HAVE BEEN DONE.

Editor THE AUTOMOBILE:

[1,347.]—A glance will show that your diagram for letter 1,319 is incorrect. Placing the switch lever on either 1, 2, or 3, will have the same effect, for the two sets are always connected in parallel, through point 3, and no movement of the switch lever can alter the connection. If, however, point 3 be omitted and a small extra switch be placed in the circuit connecting the two sets in parallel, then placing the master switch on either 1 or 2, with the extra switch closed, will give the use of the two sets in parallel, while if the extra switch be opened, the two sets may be used independently.

The same end is sometimes attained by omitting point 3 and its circuit, and making the switch lever wide enough to span both 1 and 2 at the same time. Then placing the switch at its central position would connect the two sets in parallel.

Allgheny, Pa.

MURRAY FAHNESTOCK.

WHY NOT USE A RATIONAL SIZED MOTOR?

Editor THE AUTOMOBILE:

[1,348.]—The general tendency of motor car design abroad is toward the smaller sized motor. While the roads of Europe are, as a general thing, much better than those in America, yet this in itself does not render possible the smaller sizes of motors, which are being used in fairly large cars over there. The fact that the foreign driver is much more willing to make frequent use of his gear shift has more to do with the problem than has good roads.

In America the demand seems to be that the relation of motor power to weight of car must be such that the machine will go romping up the steepest kind of a hill upon the high gear. As a result of this demand, American manufacturers are being forced to equip their cars with motors which cannot be operated economically upon any low or moderate road speed.

Not only is the first cost of the car increased by the necessity of building its component parts of such strength as to transmit the extreme power of the large motor, but any engineer will tell you that a large power plant cannot be operated economically when 90 per cent. of its work is done at about half of its possible capacity. In other words, it is wasteful of both gasoline and lubricating oil to operate a large motor under conditions where only about half of its possible power may be utilized except at rare intervals. Certainly, sooner or later, the American public will begin to realize, as have the foreign drivers, that it is much better to make use of the transmission which has been placed by the maker in the car for a purpose, than to demand a car with such motor equipment that it may be operated at all times without recourse to the intermediate gearing.

In an effort to meet the demand for a car which will climb any hill upon the high gear, the manufacturer is confronted by two possibilities, both equally bad. Upon the one hand he may equip the car with an abnormally large motor, and upon the other hand he may so reduce the gearing between the engine and the rear axle that the car may perform satisfactory hill climbing feats upon the high gear. In the first case, there will occur the greater first cost of the large motor and of the heavy driving gear rendered necessary by this large motor. To this may be added also the cost of maintenance, and the lack of efficiency under the ordinary road conditions.

In the second case, where the motor of a smaller, or perhaps more proper size, is geared down to such an extent that any kind of hill may be climbed upon the direct gear, it is very apparent that for ordinary driving upon the level road, and especially if this driving be at all fast, the motor will be required to have an extremely high rotative speed in relation to the number of revolutions per minute of the driving road wheels. This extremely high speed tends, of course, to shorten the life of the motor, to render adjustment of bearings and other parts more frequent, to increase

lubrication trouble, and to cause an unpleasant vibration to be felt by occupants of the car whether it is running or standing.

Would it not be much better to educate the American public along the line of European practice, building the motor car with an engine of moderate size and with a gearing between engine and drive wheels, which would insure to this motor a satisfactory rotative speed at the average driving speed of the ordinary operator? Such a construction would, of course, necessitate the use of the gear shift lever for hill work, but with the modern designs of gear shift this certainly cannot be looked upon as a serious hardship. Certain it is that it would be far more sensible and far preferable from the manufacturers' standpoint, were this done. This, of course, to say nothing of the money saved to the operator and owner, both in first cost and in operating expenses.

Moral: Don't be afraid to make use of your gear shift lever. Have your car geared at a proper road speed; such that upon the level your motor is not racing itself to death and upon the hill do not be afraid to shift into your second or your first speed, as may be required. You will find that your machine will stand up better, and that it will be in your service every day, instead of in the repair shop.

HOWARD E. COFFIN,

First Vice-Pres., E. R. Thomas Detroit Company.

Detroit, Mich.

FORD TROUBLES AND THE NEEDLE VALVE.

Editor THE AUTOMOBILE:

[1,349.]—Noting letter 1,324 and others in your "Letters Interesting and Instructive," recommending separation of gasoline tube and exhaust pipe as a remedy for Model N Ford troubles, will say that I think the idea good, as I have noted, though could never understand why, my Fords gave better power when started up cold than when heated, which is, of course, contrary to theory and also to practice with other cars. But, from my experience and that of others of which I know I conclude the troubles inquired about, or the necessity of "tickling" or changing the needle valve every few miles, more or less, will not be remedied by the prescribed treatment.

I think we will necessarily have to go back to the long-drawn-out discussion of "needle valve vs. no needle valve," which, it seems to me, left us quite in the dark after all. I believe that the needle valve is like money, which is said to be the root of all evil, and surely is the cause of some of it; but nevertheless quite desirable, convenient and even necessary. It is the misuse of money that brought this condemnation upon it, which is equally true of the needle valve.

I had a Ford runabout with 1906 carbureter which seemed almost ideal. It developed less power when hot, but as we always had lots to spare when either hot or cold it caused us no inconvenience. I got one with same make but 1907 model carbureter, at which time bothers began and stayed until I changed the gasoline feed nozzle from a 9-64 inch to a 1-16 inch hole, since which everything has been entirely satisfactory. I had all of Mr. Fay's needle valve troubles, which are really not needle troubles at all, but nozzle troubles.

The distance between needle and nozzle through which the gasoline flows when needle is adjusted is now about 1-200 part of an inch, and before the change was made was less than 1-400 inch. You see this space was so thin that it coated slightly and choked the motor. I think perhaps a 3-64 inch hole might be better than a 1-16, as it would give greater latitude of adjustment.

Whether these carbureters were designed for larger cars, or whether these large nozzles were put in by error I do not know, but I am sure they have gotten in some bad work on the Ford, and from Mr. Fay's and others' experiences I infer that it has not been worse on Fords than on other cars. By having small nozzle, no delicate needle adjustment is required. After having it once right needle may be turned down gently until seated, using care to not screw it in hard enough to make nozzle larger, and noting how far it was turned it may be brought back or taken out with little liability of disarrangement. While I think the needle valve is all right, we should not use too much of it; that is, the nearer the top of the nozzle the points works, the better it is.

FRED. D. CLARK.

CARBURETER OR VIBRATORS MAY BE CAUSE.

Editor THE AUTOMOBILE:

[1,350.]—In answer to your inquiry regarding C. J. Radway's troubles with his Maxwell, would state that sticking vibrators or the flooding of the carbureter during the time the car is not in use would cause it. The results of this would make a black smoke come from the muffler, caused by the excess gas which was not exploded. Sticking vibrators would cause results very similar, as the vibrator sticking would stop the explosion in the cylinder and the unexploded gas comes out of the exhaust pipe as a black smoke. When the engine gets going the motor aids a sticking vibrator, and you would then notice better results at once. I hope this will aid Mr. Radway at least a little in his troubles.

WELDON A. FOSDICK.

Along Skippers Road, New Zealand, Showing the Rough Nature of the Country Through Which Road Has Been Cut to the Gold Reefs.

FARTHEST SOUTH IN THE AUTO.

AUCKLAND, N. Z., April 8.—Take an ordinary map of the world, look up New Zealand in the South Pacific Ocean, and its size will appear dwarfed by the immensity of the surrounding waters. Yet this progressive land is very nearly the size of Italy, and not unlike it in form, with the north and south positions reversed. Two large islands, separated by Cook Strait, 16 miles in width at its narrowest point, and a number of smaller islands, comprise the colony. North Island has an area of 44,468 square miles, and South Island is 54,525 square miles in extent.

It is along the southeast region of South Island, on the eastern slope of the Southern Alps that the beautiful scenery predominates which is shown in the photographs. With the march of civilization, the automobile now safely rolls along the picturesque routes once peopled by the wild and savage Maoris.

Mt. Cook, which stretches its snow-capped peak 12,349 feet above the sea, crowns the range known as the Southern Alps. Great

glaciers extend their icy arms to within a few hundred feet of the sea on the western coast, but the eastern slope is more gradual, and it is here that generous nature has softened the rugged grandeur with a charm to be found nowhere else south of the equator, and produced a garden spot famous for its wealth of agricultural products and wool growing.

A number of beautiful mountain lakes heighten the effect of the scenery, and the largest of these, Lake Wakatipu, rivals the famous Lake Lucerne of Switzerland in picturesqueness. Its surface is 1,060 feet above the sea, yet its greatest depth extends to 500 feet below the ocean level. The roads are as a general rule of the pioneer type, but an automobile has little difficulty in traversing them, and extensive improvements are being made in the more thickly populated districts. The hardest parts of the South Island to travel are the heavy sand drifts between Cromwell and Lowburn Punt.

A Flutter with the Express.

THE AUTO IN A NEW FIELD, DOWN IN THE SOUTHWEST

By A. C. BUILDER.

DOWN here in the Southwest, where the country has not attained the age and development that begets a public spirit of road building, the genius of a most patient and careful chauffeur would be taxed to safely steer his machine over the ditchy slopes, long sand beds and through the sloughs of the timbered bottoms. Of course, this condition exists only in the rougher sections, while out on the prairie and the level country—places of good roads by nature—it is easy work to handle the car, and their "honks!" are often heard, and are becoming more numerous; ranchmen, some of the more well-to-do planters, physicians and others have them, so they are not the novelty they are in the sections first mentioned. But as time and progress puts the roads in condition, and the citizenship is enriched by a long-established habitation, the financial side of the proposition will not be the luminous obstacle that it now is; the auto—itself a money-maker and road promoter—will come to its own.

This bit of writing has to do with the last Summer's experience of two young men living in a portion of the State (Texas) of not sparse population, where there are farms, mills, shops, railways, and all the modern conveniences of the smaller cities of any other section of the country, but where there was not one automobile in a stretch of several counties.

During the Summer months there are held throughout the South reunions of the ex-Confederate soldiers, almost every county having an organized "Camp" and Confederate park, or camping ground, located at some central point. These reunions have become, locally, the event of the year, and are attended during their continuance (which is usually three days, with night programs) by almost the entire citizenship. The program, outside of public speaking and concert features, is enlivened by races and games, and the gathering partakes much of the nature of the county fair. At these reunions it has been the custom for the committee on ground privileges to grant permits to hackdrivers (to as many as desired to pay the fee) to transfer the visitors, as well as home folks, to and fro between park and "square," or depot, as the case may be. The park is generally located within a mile of town, and the fare charged by hackmen is from 10 to 25 cents. There are usually from five to ten thousand visitors in attendance at these reunions, size of crowd, of course, depending upon membership of the "Camp" and attractiveness of the program.

Two young men of limited means, who, upon a visit to the city, had longingly eyed a honking, whirring streak of red, conceived the idea of purchasing a car and making it pay for itself by carrying passengers in competition with the hackmen at the forthcoming reunion. It was with many misgivings that they entered upon the speculation, both being pioneers in the venture, and without any automobiling experience whatever. It was a question whether the people would patronize them or hold to the old methods; this was to be risked.

The next thing was the selection of a car; not an easy matter, nor a thing to be decided at once. The primary use to which it was to be put was to last a few days only, and they must have a machine that would be of some utility in this country of bad roads after the reunion was over. They had begun their contemplations a couple of months before the car was to be used, and had burdened their mail with catalogues and prices from every salesman whose address they were able to obtain. And they loaded up on automobile lore—fiction and fact—while making their decision as to the proper car for their purposes. They decided upon a 30-horsepower, four-cylinder, chain-driven, five-passenger touring car, with top. With a few hundred dollars down, this car was to be placed at their station, the total price being \$2,000.

And if Fulton was ever derided by the skeptical as to the steamboat, these young men were, by a certain element of their

community, when their intentions were made known, while others were more friendly to the idea, and were glad to see the experiment made.

The car came, and with it a chauffeur from the agency in the nearest city, and within a few hours the boys had mastered the essential rules in piloting an automobile. As the days of the reunion approached, they became more expert; they could miss a stump, round a corner, and dodge a pedestrian pretty well, and they had also gentled a goodly number of the horses.

They secured from the committee on ground privileges, for a fee of \$4, an exclusive circuit roadway from city to park grounds; this, in anticipation, they had selected and cleared of all possible hindrances. They placed their price at 25 cents, one-way trip, the distance being about one mile. The automobile was given the place of honor in the parade, conveying the captain of the camp, the sponsor, and her maids of honor. After this first trip, it was an incessant conveyor of passengers from early morn to almost midnight throughout the three days. On the city square it nosed about among the hacks and surreys with the dignity of a big ocean liner among a lot of sailing craft.

The owners worked in relief, acting as ticket agent and chauffeur. No time was lost in loading; the merrymakers flocked to it like blackbirds to a rye field, often more piling on than could be safely carried. The new auto was a better coin gatherer in proportion to capital invested than Barnum's circus. Of course, there were accidents and breakdowns, but the young men had wisely provided against this as much as possible by having on hand and ready those supplies most likely to be needed.

It is easily seen that this introduction of the automobile was a great advertisement in the community for that make of machines and the company selling them. Since then, three more have been brought to the place. The entire three days was a success to the young men—even unto the last their patronage did not wane. And this is not all; three reunions were held in as many neighboring counties after this one. They had only to drive over cross-country and buy a right-of-way privilege from the committee. The business at each was excellent.

Let any chauffeur compute the amount he would have by loading his car to its utmost capacity at 25 cents per passenger, seats full, wedged in between, sitting in laps, and swinging to side and on behind; make trips of one mile in length from early morn until almost midnight for eleven days (one reunion was of only two days' duration) and see if the total would not pay for a car, "and then some."

These young men have their car in pretty good order yet, and will have her in trim for the coming reunion season.

AUTOS NUMEROUS IN WESTERN KANSAS.

TOPEKA, Kas., May 4.—The automobile is coming to be a very familiar object in Western Kansas towns. Many farmers are putting them into use also. Men who own farms and ranches use them to make daily or occasional trips to their properties. Many of the rural route mail carriers think they are "just the thing," and so two railroad men are using them out of Kinsley.

Kinsley has a garage, in charge of Lee Hardy, who has the agency for the Maxwell machine, and he has placed some fifteen of that make here at Kinsley and at Lewis, a town eight miles east of Kinsley. Four of the doctors in the two towns own and use runabouts. The real estate man almost invariably has one or two cars at his disposal, and feels that he cannot get along without a machine in his business.

The excellent roads in this part of Kansas are an inducement for using autos, for even after a heavy rain it is but a few hours until all is O. K. for an auto ride. Merchants, auctioneers and stock men are all investing in machines, to be used for profit or pleasure.

Racy Lines of the Underhung Chassis of the American Roadster.

FOUR AMERICAN MODELS FOR 1908.

Although the American Motor Car Company, Indianapolis, Ind., has shown that progressiveness so characteristic of American builders, by bringing out roadster and touring car models, neither of these has lost any of the features which made it conspicuous in the 1907 season; the roadster uses the under-swung frame, the touring cars the frame carried above the axle. Four 1908 American models are marketed. A 40-horsepower type, with not a few 1908 refinements, is built in roadster and five-passenger touring car styles, while the two models are mounted on 50-horsepower chassis, fitted with roadster and seven-passenger touring car bodies, the roadster style having, as in the case of the 40, the under-swung frame.

These 50-horsepower chassis stand for the representative '08 product of the factory, in that they are new models, having been made in but small quantities during the past season, in which season the 40-horsepower chassis were the standard constructions. A few differences exist between the 40 and 50, foremost in which is the use of a four-speed and reverse selective gear set in the 50 and the adherence to a three-speed progressive set in the 40. Besides the under-swung frame, the roadsters differ from the touring cars in that the latter employ a rear platform spring, whereas the semi-elliptic type are in regular use in the front and rear on the roadsters. The touring cars and roadsters in the 40 and 50 models vary slightly in wheelbase, the 40 roadster wheelbase measuring 106 inches, whereas the touring car is 116; and in the 50-horsepower chassis the roadster wheelbase is 110, but the touring car measures 124 inches, this additional length giving opportunity for the use of two additional tonneau seats. According to A. L. A. M. rating, the 40 chassis with its 5 by 5-inch cylinders works out exactly 40-horsepower, but the 50 chassis, with its 5 1-4

by 5 1-2-inch cylinders and long stroke, comes to 44.1 horsepower.

The American motor follows that conventional type employing cylinders cast in pairs with valves carried in expansion chambers on the right side and opened through direct lift from a camshaft carried within the crankcase. A neat disposition of the motor parts has been accomplished by carrying the Schebler carbureter centrally to the right and the timer on the top of a vertical shaft between the twin castings on this side. Aside from these general motor marks there are a few interesting details about it that remove it from the realm of pure conventionality. The top half of the crankcase serves as a pan or mud apron construction and in the touring models rests directly on the side members of the frame, thereby eliminating a subframe construction; whereas, in the roadsters a super-frame is required. The gears at the forward end of the crankshaft and camshaft are of the spiral type running in oil, and instead of keying them to the shafts they are coupled to flanges on the shafts. The crankshaft pinion is steel, whereas that on the camshaft is built up of fiber and gray iron. Use is made of separate cams keyed and pinned in position, the camshaft is carried on a bronze bearing between adjacent pairs of cams and the bearings are of slightly different diameter in order to permit of an endwise movement of the whole shaft when taking it out. A change over 1907 construction is carrying the timer on a vertical shaft

at the right between the cylinder castings instead of on a short vertical shaft beneath the dash. This driveshaft is encased in an aluminum housing, the top end of which is anchored, while at the lower end is a shoulder fitting into a pocket in the crankcase. The vertical timer shaft is arranged with a slip joint in it and at the lower end carries a worm which meshes with a worm wheel on the camshaft; and by the use of a lever with ball end which bears against a ball thrust washer, the lower end of the timer shaft and the worm can be moved upwards

Change Gear Set of American Touring Model, Showing Three-point Support.

or downwards, thereby advancing or retarding the contacts of the timer while the exterior of the timer, to which the wires are attached, remains stationary.

Use is made of a double ignition system employing two sets of plugs located respectively in the caps over the intake and exhaust valves, the high-tension wires to which are neatly housed in a large diameter tube carried above the cylinder heads. In this tube are only six wires, those for the two plugs in the rear cylinder not entering it. Current for one set comes from a high-tension Simms-Bosch magneto with self-contained distributor and for the other set from a storage battery. Motor lubrication is effected through a five-feed lubricator, located under the floor boards in the touring car and housed within the hollow dash in the roadster. In the cooling of the motor, a few strictly American constructions are found; the water enters the cylinder jackets at a point on each side of the exhaust, the aim being to equalize the cylinder temperatures. The fan is supported on ball-bearings carried on a small shaft supported at the end of an arm clamped to a boss on the front cylinder casting, which arrangement allows of the removal of the fan without disturbing other parts. The blades are made integral with the aluminum hub.

It is when coming to the transmission part of the car that the several changes over '07 construction appear, namely, the employment of selective gear set, as well as that of double expanding brakes, acting within the same rear wheel drums, the expanding members being located side by side and made with the same diameter and width. The selective gear-set, that for the touring car illustrated herewith, has the main and countershaft carried side by side in the same horizontal plane and carries the shafts on annular ball bearings. The case, made in upper and lower halves, has a three-point support in the touring car model, these points being at opposite front corners and at the rear center, the last point being on a drop cross-piece of the frame. The cone clutch used in all models is held in engagement by a spring made from 1-4 by 1-inch flat stock, wound spirally, the thrust of which is taken by large ball-bearings encased in the hub of the clutch and packed with non-fluid oil. Between the clutch and gear-set is a square end coupling made in halves to facilitate adjustment of the spring. This coupling also makes it possible to remove the clutch without molesting the motor or transmission.

The rear axle construction of the American cars includes bevel gear drive to a floating type of axle, the car weight being carried on the axle housing and the axle driveshaft revolving the wheels by means of square inner ends engaging the differential and square outer ends engaging the jaw clutches. On each of the rear wheels is a double set of expanding brakes located side by side and operating within the same steel drum. The two brakes are exactly alike and work under similar conditions all the time excepting in that the expanding shoes are pivoted at diametrically opposite points, one at the front and the other at the rear stud, forming the support, each not only acting as a support for one of the brakes but a portion of it being formed into an expanding cam for applying the other brake to its respective drum.

The frames employed in the touring cars consist of the side members and three cross-pieces, the former having a 5-inch vertical depth, a 1 3-4 horizontal web and manufactured from 3-16-inch stock; there is a rise in the side members of 2 1-2 inches in front of the rear axle, which is done to increase the possible range of action of the platform spring. Supporting the rear cross member, the

center of which carries a triangular bracket, bearing upon the center of the transverse spring, are two long diagonal braces extending from the side members at a point ahead of the rear axle. In addition to the three cross members already mentioned, the crankcase further acts as a tie for the front of the frame and the gear-set serves a similar purpose midway of the side members. The roadster frame embodies side members narrowed at the dash as well as a pair of straight supplementary frame pieces raised higher than the main frame members, and on which supplementary pieces are carried the motor and gear-set. In this frame construction the forward springs are placed on top of the front axle with their rear ends carried in a fixture riveted to the upper side of the frame, and their front ends linked to the end of the frame. The semi-elliptic rear springs are revolvably mounted on the back axle with their forward ends connected to brackets on the upper side of the frame and their rear ends connected to a crossbar which passes completely across from sill to sill of the car. With this construction, the company claims that should the spring break at the forward end, as the bolt comes out, the frame simply drops about an inch, and no material damage is done; in fact, the further claim is made that, for demonstrating, the cars are often driven with the forward end of one of the front springs unsupported. In spite of the use of this drop frame construction, the car has a clearance of 10 1-4 inches, the upper side being protected by a practically flat shield plate. In the 40 roadster, 36-inch wheels carry 3 1-2 and 4-inch tires; the 40 tourist, with the same diameter wheels, uses 4-inch pneumatics front and rear; in the 50 roadster the sizes are as in the 40; but in the 50 tourist 4 and 5-inch sizes are in use in front and rear.

It will be apparent from the foregoing that, with the single exception of the under-swung frame of the roadster type, there is no marked departure from engineering practice current with the majority of designers in this country, though many of the minor details of the power plant and transmission of the different models have been worked out in a distinctive manner, showing the painstaking attention that has been devoted to the small things. In fact, this is evident on every part of the American cars. The design of the under-swung frame type of car, which is continued this year, was so well executed in the original that practically no changes were found necessary to bring it up to date, something that is very frequently necessary on the later editions of first models. This American roadster is an excellent illustration of the fact that a low hung car need not necessarily lack clearance, as it has more than many of the ordinary type.

Operating Side of the 50-horsepower Motor of the American Touring Car.

One of the Latest French Flyers—The Aeroplane Blanc at Marseilles Ready for a Trial.

FRENCH AERONAUTS ARE BUSY.

PARIS, May 1.—Tremendous activity is being displayed at all the aeronautical shops in and around Paris—and their number is now by no means small. At the Voisin Frères shop, in addition to several aeroplanes very similar to the one used by Delagrangé in his recent record flight, an entirely new machine of the monoplane type is being pushed forward for Henry Farman. The aeroplane, which is known as the *Flying Fish*, will be fitted with the first of the eight-cylinder air-cooled engines that Renault has just produced. This week the entire frame work of the aeroplane was completed, and it was only waiting for its power plant and canvas covering.

The most original and at the same time one of the most promising of aeroplanes ever built is now receiving finishing touches at the Antoinette factory. Its chief interest lies in the fact that it is the first heavier-than-air machine to be constructed to carry two people, the mechanic and pilot occupying entirely separate positions in the new Antoinette.

M. Levavasseur, who has designed the aeroplane, is the builder of the extra light Antoinette engines used by the most successful aeronauts, and head of the Antoinette company. Connected with him is Captain Ferber, an officer of the French army, who has been foremost in aeronautical matters for ten years. Levavasseur took up aeronautics fifteen years ago, designed a light engine for his flying machine and was bluntly told by everybody that he was mad. Nobody being willing to give a cent for his engine for aeronautical purposes, he put it into a motor boat, beat all European records, and when his engine had won fame went back to aeroplane construction.

In the new two-passenger flying machine Levavasseur has built what may be roughly described as a long, narrow boat, has fitted two wings, a lateral and a vertical rudder at the stern, and placed his engine right forward in the bow, where it drives a two-bladed aluminum and steel propeller.

The resemblance with a boat is striking, for the bow is sharply pointed, the craft broadens out amidships and narrows slightly toward the rear. It is decked over with the exception of the forward portion reserved for the power plant and a cockpit to be occupied by the steersman. Instead of a wooden or steel skin, however, the craft is covered with canvas, treated with a coat of waterproof paint, and the deck is of the same style of construction. At the rear is a horizontal rudder the operation of which determines the rise and fall of the aeroplane, and below it is the usual vertical rudder by which movement to the left or right is obtained.

The entire sustaining surface is a couple of light canvas wings 40 feet from tip to tip, attached to what might be called the gunwale. Four men working ten hours a day were six months in constructing this pair of wings, each section of which has been tested to a pressure of one and a half tons.

During the initial trips power will be obtained from an eight-cylinder water-cooled Antoinette engine of 60 horsepower; a little later, however, this will be replaced by a sixteen-cylinder

engine of the same make declared to develop 120 horsepower at 1,200 revolutions a minute. Water for the engine is carried in a couple of copper tanks immediately above the angle formed by the V-arrangement. Later a radiator will be fitted, giving a reduction in weight and allowing the engine to be run for a much longer period than is now possible with the tanks. The gasoline supply is carried in a cigar-shaped tank in the bow, this part of the power plant being all that is visible when the aeroplane is viewed from the ground. Steel cylinders of 4-inch bore and stroke, fitted with copper water jackets, are the feature of the new engine. There is neither flywheel nor carbureter, and ignition is by high-tension Bosch magneto.

Drive is direct from the engine to the two-bladed propeller in front of the aeroplane, the speed of which will therefore be 1,200 revolutions per minute. It is estimated that the aeroplane will leave the ground at a speed of 30 miles an hour, and that its rate of aerial travel will be 54 miles an hour. With the present water and gasoline equipment it will be possible to stay aloft half an hour. Engineer Levavasseur, however, declares that within five months this machine will have remained in the air two hours without touching ground. As if to prove that the aeroplane is intended for long-distance travel, a light awning had been rigged up to give protection from the sun for the well in which Captain Ferber will have his seat. The mechanic, squatted further forward with the engine in front of him, has not been the object of such attentions.

Ferber Aeroplane, of Boat Type, to Carry Two.

The Beautiful Mansion on the Place de la Concorde, Paris, the Home of the A. C. F.

IT is now exactly thirteen years ago—February, 1895—that a mere handful of autoing enthusiasts held, at Marquis de Dion's private residence in Paris, a meeting out of which came the foundation of the Automobile Club de France. Little did they think that such a powerful organization would emerge from what they thought at that time would be a mere local and social club. The automobile was then in its infancy, and what few "horseless vehicles" were to be seen elicited more mockery than applause or interest. Among those present at this historical meeting such names as those of Baron de Zuylen, Pierre Gifford, Marquis de Dion, Paul Meyan, Count Récopé may be mentioned. As may easily be inferred, the discussion was a friendly one, and before the day was over the Automobile Club de France had started what was to be an eventful career. A unanimous vote carried Baron de Zuylen to the presidency, and it is a remarkable fact to record that this gentleman has held the position ever since.

A few weeks after, the A. C. F. inaugurated its first clubhouse, which was beautifully located on the Place de l'Opera, right in the center of the town. And the new association began to grow fast, each committee meeting having to ballot several dozen candidates.

Nobody expects me to write here the history of the automobile in France and its extraordinary development. One would have to do so in order to follow the A. C. F. along its course of prosperity, as both histories only make one. As a matter of fact, nothing worth recording has happened in automobile matters in France since 1895 without the club playing an important part in it.

Before one year had elapsed after the foundation, the membership had reached 300, and two years later it was deemed necessary to move to larger premises. After much discussing and negotiating a place was found which enabled the A. C. F. to rival with any club or association throughout the universe in the matter of a clubhouse. Every one will agree with me that no finer place could be found than the beautiful mansions occupied by the A. C. F. on the Place de la Concorde, and which, by the way, are now the property of the club, a syndicate headed by Baron de Zuylen having made its acquisition and allowed the club to pay for it on the installment plan. The building comprises five stories and includes everything that one could expect to find in a modern clubhouse. Outside of big and luxurious restaurants, lounge, smoking and billiard rooms, library, and large meeting rooms, there is a magnificent hall used for festivities and also a regular theater with all stage and machinery

fittings, where about 800 people can be seated in boxes and orchestra seats.

The actual membership of the A. C. F. is 2,300, and the annual subscription is 200 francs (\$40), with an entrance fee of a similar amount. A few words about the organization or constitution of the Automobile Club de France will not be out of place here. It has been vastly altered since the days of the foundation, so as to cope with the growth and developments of what has become much more than the mere pastime it was at first. The A. C. F. is now divided into two parts, which remain distinct as far as administration is concerned. They are: first, the social club proper or "Circle," which is merely the same as an ordinary club; and, second, the promoting association or Societé d'Encouragement," whose aim is the general development and protection of the automobile industry, sport and pastime, and the promotion of races,

contests, trials, shows, or any other event liable to further or favor same.

It may seem strange to state, however, that no member can belong to any of the allied associations without also joining the other. The reason of a nominal division is obvious. While the "Circle," being considered as a purely sumptuary organization, has to pay heavy taxes, the "Societé d'Encouragement" escapes these on account of its object and is, therefore, able to handle a lot of money and receive or expend big amounts.

A committee of fifty members manages the "Circle," and as its organization is pretty much the same as that of all clubs, there is little to say about it.

Managed by Committee of Fifty.

The constitution of the "Societé d'Encouragement," which, to foreign eyes appears and is really the A. C. F. itself, will be found much more interesting to study, and I propose giving here a full explanation of same. It is managed by a committee of fifty members, who elect in turn among themselves a board of nine directors, which governs the association and represents it in all circumstances. At present this board of directors or acting committee is made up as follows: President, Baron de Zuylen; vice-presidents, Marquis de Dion and Mr. Henri Menier; treasurer, Mr. Dehideux-Vernimmen; members, A. Ballif, Marquis

Private Theater of the Automobile Club of France.

de Chasseloup-Danbat, Count de la Valette, Count Récopé and Gustave Rives. It may be here stated that there is no secretary on the board, since the secretarial work is done by a paid official, who, at the same time is at the head of the offices of the club. An idea of their importance can be gathered from the fact that no less than 25 clerks are employed by the various "commissions" or sub-committees, irrespective of the footmen and livery division, which numbers no less than 70 people. By the way, the restaurant of the A. C. F. is known among the best in town, and its *chef* draws a princely salary, having twelve men or boys in the kitchen under his orders.

But we must return to our "commissions," as these represent one of the most remarkable parts of the system under description. Now it will be easily understood that in such a powerful organization, having to deal with so many different questions, the task of the members of the board would be simply an impossible one should they try to personally confront every problem. Therefore, as the field of actions grew larger, and the A. C. F. scope of influence widened, it was found necessary to

The Library, Ample and Well Stocked with Books.

Samuel A Miles and W. F. Bradley Visit the A. C. F. in the Pierce Great Arrow.

form sub-committees, or "commissions," as they are called in French, each of which was entrusted with a special subject. They number at present eight, viz.:

Eight Powerful Commissions.

(1) Commission des Concours et Fêtes Exterieures, which has in charge the promotion of all trials and contests which are not of a purely sporting character; that is, in which speed is not the essential factor.

(2) Commission des Relations avec les Automobile-Clubs de Province, which, as can be gathered from its name, corresponds and deals with provincial clubs.

(3) Commission du Contentieux, which deals with law and judiciary questions.

(4) Commission des Expositions, which has in charge the promotion of shows generally, and the big annual Paris show particularly.

(5) Commission Technique, dealing with all subjects of a purely technical order.

(6) Commission de Tourisme, devoted to everything connected with touring and questions relating thereto.

(7) Commission du Yachting Automobile, whose name explains itself.

(8) Last, but not least, the Commission Sportive, having the upper hand over purely sporting questions and whose chief work is the annual promotion and organization of the big annual speed contest known the world over as the Grand Prix de l'Automobile Club de France.

A remarkable fact about these various commissions, and more especially about the last named, is the almost unlimited power they have developed in the life and history of the A. C. F. Now, it would seem that they are to all intents entirely under the dependency of the board of directors, since they are formed by the said board, and could be suppressed by a decision of its members at any time. Be it as it may and explain it as you can, the fact is that these subcommittees have got to be entire masters of their line. Many a time have they taken or advocated measures which were not in harmony with the committee's idea, and the latter has invariably yielded to them. This peculiar situation is more remarkable with the Commission Sportive, whose members are very independent in their ideas, and the on-looker can even ask himself what would happen if the committee ever insisted on ruling over any of the commission's decisions.

Commission Sportive Of and For the Industry.

Now, to foreign eyes, this Commission Sportive represents, therefore, the A. C. F. itself to a great extent. It is the one which has the biggest international prestige in the French club, and one must admit that it fully deserves it on account of the pains taken by its leaders and of their undoubted abilities in the

Where the Members Enjoy Themselves at Billiards.

work they perform. Therefore, it will be found interesting to devote here a special study. The president of this sub-committee, which, in many ways eclipses the committee itself, is Chevalier René de Knyff, and the vice-president, Count Robert de Vogué, two of the best-known figures in international motor matters. The list of members is as follows: Prince d'Arenberg, Henri Brasier, Etienne Girard, Georges Huillier, Count de la Valette, René Doysel, Guinonet de Léon, Louis Renault, Baron de Turckheim, while Messrs. Clément, Gobron and Bocandé are also entitled to a seat as delegates of the Chambres Syndicates, or makers' association. Now the observer cannot help being impressed by the fact that this board which practically controls and manages motor racing in France is almost entirely made up of trade representatives, and, what is more, of the biggest firms and concerns.

A perusal of the above list would show that Panhard, Brasier, Charron, Renault, Dietrich, Clément and Gobron are all represented either by their heads or by some people holding prominent positions in the firm. Indeed, out of the above 14 gentlemen, not more than four have no direct connection with the trade, and even then some of these four are known to hold some financial interests in same.

It will not, however, surprise many people to hear that the big success of the French racing generally can be put down to the good work done by such competent people. The old saying, "have millmen in the mill," is ever true.

To close up with this article on the big French club, a few words must be said here of its prominent part in the promoting of the annual Salon, or show. Thanks to the efforts of G. Rives, who is past master in this line, the A. C. F. comes in every year

for a big share of the profits made in this enormous and world-famed enterprise. This is what enables the club to carry on an expense list worthy of its reputation.

And if I had to name another reason for the success and prosperity which has marked the career of the Automobile Club de France, ever since its inception, I would put it down to the remarkable spirit of concord and alliance which has always animated its leaders.

SOME FOREIGN OBSERVATIONS BY S. A. MILES.

From S. A. Miles, general manager of the N. A. A. M., who is now touring Great Britain and the Continent with a Pierce Great Arrow, comes a few observations:

"I have been greatly impressed by the enormous number of 'buses and cabs in use in London. Horace Bell, who is well remembered in the States, is the manager of the cab company, which has 505 cabs in operation. These cabs run at 20 miles an hour through the traffic, and are, I should say, the greatest advertisement the motor car has ever had. The 'buses are less noisy and less frequently disabled than when I was last here.

"The touring facilities available in London at the headquarters of the Automobile Association are most excellent. Just at present there is a row on between the A. A. and the Royal Automobile Club, a lordly thing which seeks to enjoy the power of veto, etc., over which the rank and file is rebelling.

"To accomplish the general good of automobilizing, organizations must be good in character, and this holds good both on this side of the water as well as in America.

"I am looking forward to some most enjoyable touring."

GRAND PRIX DES VOITURETTES WILL BE POPULAR EVENT

PARIS, May 1.—Without claiming to be a prophet, one may put forth the statement that the voiturette Grand Prix, to precede the international race on the Dieppe circuit next July, will be one of the most popular events ever disputed in France. The fact that out of the 60 cars only six are foreigners does not appear likely to have any influence on the public estimation of the race; probably, indeed, it will enhance the value in the eyes of the natives. During the past eighteen months or two years France has certainly got rid of the idea that the *car de luxe* is the only interesting article in the automobile world, and, once free from this illusion, has plunged into the small car or voiturette field with unbounded enthusiasm.

There is no similarity whatever between the French voiturette and the small cars which dealers in this country are afraid American constructors may ship over in huge quantities at any moment. It is a distinctly home product which public taste and racing regulations have developed on certain fixed lines.

For the "Grand Prix des Voiturettes," as for the similar but privately organized contests for runabouts, 3.9 inches for a single-cylinder engine has been fixed as the maximum bore; for two, three, and four-cylinder engines the cylinder bore is proportionate, stroke being unlimited. It is a diminutive power plant that is carried under the bonnet of the small cars, smaller, I believe, than any produced by the better known American factories. Ford, indeed, who is now well represented in France, is altogether too big to come into the race with his small cylinder runabout, and, according to Henri Depasse, the Paris agent, this popular American firm will not construct a baby four-cylinder of 2.4 inches bore.

According to all the information at present available, Isotta-Fraschini, and Pilain, the one Italian and the other French, will be the only two firms entering four-cylinder cars under the limited bore of 2.4 inches. There will be no three-cylinder engines, and probably not more than 25 per cent. of the entrants will have two-cylinder engines measuring 3.07 inches bore; the great majority will be single-cylinder cars with the maximum bore of

100 millimeters, the single-cylinder type having sprung into unusual favor since the inception of the voiturette class.

In every case the voiturette racers follow the general disposition of the large cars, the power plant being forward under a bonnet, transmission being through sliding gears, and final drive generally by cardan shaft and live axle. There is not a car constructed in France with the motor under the seat, under the body, or at the rear, and there will certainly not be a single vehicle in the voiturette race which will differ externally—except of course in size—from the mile-a-minute racing cars.

Features of Some of the Undersized Racing Cars.

The undoubted favorite in the runabout race is Sizaire-Naudin, the victor in the voiturette contest of last fall. New Yorkers had an opportunity of studying the external features of the firm's production in the New York-Paris contest, when Pons made a little run up-State on a Sizaire and retired with a broken differential. For the Grand Prix three single-cylinder cars have been constructed, all with the maximum bore of 3.9 inches, and stroke of 6.2 inches. As the team is quite ready it is probable that the machines will be run in the Targa Florio preparatory to competing on the Dieppe circuit.

At the normal engine speed of 1,700 revolutions a minute the small power plant develops 16 horsepower on the brake and is geared to run at 12, 18 and 39 miles an hour at 1,500 revolutions a minute. As the engine can be accelerated up to 2,200 revolutions a minute, the speed of the car will be over 50 miles an hour under favorable conditions. Among the few changes which have been made since last year's models is the increase in weight of the moving parts in the engine. The piston and connecting rod last year were of especially light construction and were found to have a certain amount of flexion. The extra weight which has been put into these parts has tended to increase the efficiency of the engine, according to the factory experts. Valves are superimposed, the inlet being operated by an overhead rocker arm. Overhead valves, indeed, will be a feature of both the

Grand Prix and voiturette racers, a large number of the cars also being fitted with hemispheric combustion chambers.

High-tension magneto, of Bosch manufacture, supplies the current for the Sizaire-Naudin. In this respect there is a remarkable uniformity among the small racers, the number of those obtaining their current from storage batteries, or even carrying storage batteries as a stand-by not exceeding five per cent. The engine is water-cooled, with circulation by thermo-syphon. Here again there is uniformity, not a single air-cooler being entered. Regarding the value of a pump small car constructors are not entirely of one mind, though thermo-syphon systems of water circulation are in a majority in the cars presented for this contest.

In suspension, transmission and drive Sizaire-Naudin has worked on independent lines. Thus the fore part of the car has a single transverse spring having a certain resemblance to that of the Mora; the rear suspension is by means of reversed semi-elliptic springs, the rear ends of which are attached to the axle. A metal disc clutch transmits the power through a propeller shaft to a gear box on the rear axle, where three speeds forward and one reverse are provided, all the forward speeds being on direct drive. Instead of the exhaust being carried to the rear below the chassis it is brought out through the box behind the mechanic seat, giving the rear of the car very much the appearance of the stern of a motor boat.

Foullaron Voiturette Candidate and Driver Grillet.

with a patented system of extensible pulleys, which, though successful under ordinary touring conditions, is not looked upon seriously for a race. All other constructors that are entrants in the race, have shaft-driven cars.

LONDON HAS NEW TAXICAB RULES.

With a view of ameliorating grievances complained of by the patrons of taxicabs in London, the commissioner of police has issued the following regulations, which, it is expected, will relieve congestion and improve the service:

- (1) The drivers of the first two motor cabs must be with their cabs and be ready to be hired at once by any person.
- (2) All cabs on the standing must move up as vacancies occur.
- (3) No motor-cab engaged for some future time shall remain on the standing, unless willing to accept any intermediate hiring that may be offered.
- (4) No disabled motor-cab shall remain on the standing unless such disablement is strictly temporary, and can be, and is, remedied at once. If the disablement is not of such a nature, a notice (in a form to be approved by the commissioner) must be at once placed on the cab to the effect that it cannot be used, and will be removed for repair.

PERMANENT SHEDS FOR THE PARIS FLYERS.

PARIS, May 1.—On the Issy-les-Moulineaux ground permanent aeronautical sheds for the proper housing and care of aeroplanes are being built by special permission from the war authorities. Previously all sheds were flimsy wooden structures on the outside of the wall surrounding the military drill ground and adjoining the newly-erected bar which its proprietor, with an attempt at English, has named the "Aerot's Bar." The new sheds, in wood and plaster, are on the drill ground itself, and will offer much better facilities for entering and leaving.

The Passe-Partout, One of the Voiturette Race Candidates.

Gregoire, one of the two-cylinder champions, has three cars of this type, each one with a bore of 3.07 inches and stroke of 5.9 inches. Changes from the standard type of engine constructed by the firm are overhead valves, commanded by rocker arms, and dome heads, the plugs being placed laterally just below the inlet. The crankshaft is offset ten degrees. Standard lines are followed in the sliding-gear transmission and final drive by rear live axle. A special feature, however, is the parallelogram suspension of the cardan shaft. With the radiator well behind the rear axle, the seats completely encased in and the rear in turtleback form, the little car has all the features of a racer, and a fast one at that.

Isotta-Fraschini and Pilain, the two firms entering four-cylinder cars, have both built engines with cylinders in one casting, dimensions for each being 2.4 bore by 3.9 stroke. Both have ignition by high-tension magneto, the French car being equipped with a Nilmelior and the Italian with a Bosch; the Pilain is one of the few cars having a double system, accumulators of course only being used to start up or as a stand-by.

Only one make of car in the race is fitted with side chains, European constructors generally believing that the shaft is the *dernier mot* in small car construction. Lion-Peugeot, however, had sufficient success in the last voiturette race, when all three cars had double chain drive, to convince them that it would be good for the Grand Prix. Foullaron employs a belt drive

Sizaire & Naudin Voiturette—Driver Sizaire at Wheel.

FRENCH MAKERS OBJECT TO VANDERBILT CUP RULES

By W. F. BRADLEY.

PARIS, May 1.—French automobile constructors are almost unanimously of the opinion that the Racing Board of the American Automobile Association has been wasting its time in the determination of weight limits for the next Vanderbilt Cup race. Automobile France argues that America accepted the international racing rule adopted at the Ostend conference and ratified at the Paris conference, and that the plain duty of the United States is to abide by those regulations. All constructors with whom I have spoken on the subject declare that they are unable to understand the necessity for any change in the weight limits, even those adopted not being in accordance with the Ostend standard, which was fixed at 1,100 kilograms minimum, without water, tires, tools or spare parts.

Not only are individual members of the trade dissatisfied with the Vanderbilt draft received, but the Automobile Club of France has raised its voice in official protest. At the last meeting of the Racing Board it was decided to oppose the adoption of the outlined Vanderbilt rules, on the ground that America, as one of the contracting parties, was bound to the international conditions.

In order to get inside information on the matter, THE AUTOMOBILE correspondent called upon M. René de Knyff, chairman of the Commission Sportive of the Automobile Club of France, and asked for his views on the matter.

What Chairman De Knyff Has to Say.

"You will understand what we feel about the matter," declared the pioneer French automobilist, "when I tell you that an official protest has been drawn up and will be sent by the next mail to the Automobile Club of America. At the same time a copy of the protest will be sent to every club connected with the international conference.

"Our grounds for protest? They are that an international rule was agreed to at the Ostend conference, that America approved it, and that every nation taking part in that conference is under an obligation to hold no race for cars exceeding a bore of 155 millimeters.

Neither American Delegate Attended Ostend Meeting.

"Though invited, I believe neither of the American delegates attended the Ostend meeting, at which after a long discussion we agreed to hold no races in 1908 except for cars of a bore not exceeding 155 millimeters, and of a minimum weight of 1,100 kilograms. At the November meeting in Paris the American delegates were present and agreed to these rules. Now we are informed that America intends to break away and cause constructors to build an entirely different set of cars."

It was pointed out that the disruption between the A. A. A. and the A. C. A. might be considered as nullifying the agreement so far as America was concerned. M. René de Knyff appeared to be puzzled by the nomenclature and admitted that the only association that was familiar to him was the A. C. A.

"But put aside this question of clubs. I suppose the object of the American Racing Board and of Mr. Vanderbilt is to make a success of the Vanderbilt Cup event. How can you do it if you persist in adopting a rule that keeps out all European cars? Expenses in connection with a race are frightfully heavy, and it was entirely with a view to diminishing them that the national clubs got together and decided on a common basis for all the great speed tests. You cannot expect us to build cars specially for the Vanderbilt race, and to compete with our 155 millimeter machines against cars of 170 or 180 millimeters would be folly. The American board is two years behind the time, for it has adopted the rules that were in vogue for the first Grand Prix on the Sarthe in 1906."

"Do you intend to combat the Vanderbilt conditions?"

"Most certainly. As a club we shall refuse to have any connection with the race if the international rule is not adopted. We cannot prevent French constructors going over to America and competing if they wish to do so, but we can refuse to help them, and we shall certainly wash our hands of the whole affair if America refuses to live up to her agreement."

"Some American cars are already built? Well, that is a pity, but there cannot be many of them, and I know that Mr. Vanderbilt and Mr. Thompson are such thorough sportsmen that they will not allow a mistake or a misunderstanding to give two or three firms an unfair advantage over the entire world. Of course if Mr. Vanderbilt wants his race to be for American cars only, let him stick to the proposed rules, and I am certain his wish will be gratified. But, quite apart from obligations, if you want to make the American event a success, you will certainly have to adopt the rules of the Ostend conference. Our Sarthe cars are gone, who knows where, and we do not want to build any more of that type."

Delegate Hogan Tries to Explain Complications.

W. S. Hogan, one of the delegates of the Automobile Club of America, seen at his office in the Avenue Kleber, at once confirmed the statements of M. René de Knyff regarding the obligation of America to submit to the international rule.

"Personally I was not present at the Ostend international conference, and was not even notified to attend. If the A. C. A. did send a notice, it certainly did not reach me. To the best of my knowledge my colleague, Howard Johnston, was not present either. When I heard that such important business had been enacted I was sorry I had not received a copy of the program, for in that case I should have attended, whether convoked or not.

"At the international conference held in Paris, November 21 of last year, both Howard Johnston and I were present. Our instructions from the A. C. A. were to act as we thought best, and we consequently voted the ratification of the Ostend rules. The conference was attended by every recognized national automobile club, and the vote was unanimous. In my opinion the only sensible policy was to adopt the uniform rule; times are now too strenuous in all countries for money to be squandered on the construction of half a dozen sets of racers each year. Builders in every country in Europe want a rule which will allow them to build one set of cars per annum and to race them in every country holding a long-distance speed test.

"The conclusion of the matter is that the American club, having given us the power to act, is under an obligation to abide by the contract, and though I know that differences have arisen between the A. C. A. and the A. A. A., that should not prevent the Ostend rule being adopted for the Vanderbilt Cup race."

What the Minutes of the Meeting Show.

According to the minutes of the November conference it appears to have been thoroughly understood that no nation should hold a speed test under any other rules than the one decided upon at Ostend. The Belgian delegate in his remarks stated that it was not the intention of the conference to forbid the holding of races for smaller cars, but that no races should be held for machines more powerful than those under the Ostend rule.

A visit to the office of the International Association of Recognized Automobile Clubs, which has been put on a more permanent basis as a result of decisions taken at the November meeting, brought forth the fact that neither of the American delegates was present at the Ostend meeting. A letter was received from President Hoyt, just before the conference, asking that the A. C. A. members be excused. Both delegates, however, were present at the November conference, as the official minutes show, and voted in favor of the international racing rule.

NO VANDERBILT RECOGNITION SINCE A. C. F. KILLED BENNETT

IN view of the fact that the Automobile Club of France, immediately after interring the Gordon Bennett race in the winter of 1905-06, practically disregarded any further communications in reference to the Vanderbilt Cup race, classing it as a similar event, the comments of Chairman De Knyff read somewhat humorous. He states: "As a club we shall refuse to have any connection with the race if the international rule is not adopted." As a matter of fact the Automobile Club of France has had nothing whatever to do with the Vanderbilt Cup race for several years past, declining in 1906 to designate officially the French entrants as representing the club and France.

In 1906 the Vanderbilt Cup Commission arbitrarily named the five French cars, Chairman Jefferson deMont Thompson, while in Europe and in attendance at the Grand Prix, making arrangements for the French entries in the race for that year.

France made the Gordon Bennett an impossibility because it did not desire to limit its makers to a team of five cars when any other country, no matter how small, could have a similar number. It was for this reason that it withdrew its recognition of the Vanderbilt event.

It is a certainty that there will be French contestants in the next Vanderbilt race, several firms having stated that they would enter cars no matter if the 1908 international conditions were not adopted. Germany is certain to be represented, England is a possibility, and it is more than likely that Italy will not lose her prestige by remaining out of the fray.

While it is admitted that international rules should be in effect for all big road races, circumstances made this practically an impossibility for the 1908 Vanderbilt race. Furthermore, the manner in which the A. A. A., the governing body of automobile racing in this country, has been represented in the councils of the International Association of Recognized Automobile Clubs has been careless, to say the least. The A. C. A., as a matter of courtesy through its having been the first club formed in this country, was continued by the A. A. A. as a spokesman of the country, but it is a recognized fact that its manner of looking after the interests of the A. A. A. has not been entirely conscientious. The A. C. A. has never troubled itself to make any report from time to time to the A. A. A., and the latter apparently took it for granted that there was nothing to report upon. Until this misunderstanding over the 1908 conditions came about, the matter of international relations occupied slight attention.

Unquestionably there has existed in Europe the impression that the A. C. A. was the direct and duly authorized spokesman

of the United States, the existence of the A. A. A. being imperfectly known. The present discussion will bring forth the exact situation, and it is reasonable to suppose that the A. C. A., no longer being a part of the A. A. A., will suggest to the foreign

Vanderbilt Plaques to the A. C. F.

To the Automobile Club of France, in recognition of its victories in three Vanderbilt Cup races, W. K. Vanderbilt, Jr., some time presented to that organization a trio of bronze plaques. That of 1904 tells of the victory of Heath driving a Panhard; for 1905, Hemery, driving a Darracq; and for 1906, Wagner, driving a Darracq. These plaques adorn the walls of the club's house in Paris.

clubs that they deal directly with the A. A. A. as far as racing is concerned. This would seem to be a logical sequence, though there are those in this country who believe in the framing of our own rules and leaving it up to the foreign makers as to whether or not they care to participate in our events.

CONNECTICUT'S ATTITUDE TOWARD VANDERBILT CUP RACE

HARTFORD, CONN., May 4.—The principal topic of local conversation is the possibility of holding the Vanderbilt Cup race in Connecticut. It is much desired that the big race take place in this State, for, measured in dollars and cents, it means that a vast sum of good money will come into the State. But there is another side to the question—the law. The present automobile law in force in Connecticut is one of the best in the country, and all speeds are abolished up to 25 miles an hour. To bring about this measure, considerable hard work was necessary on the part of the autoists and clubs. When the next legislature convenes it is possible that an attempt will be made to put in force a substitute measure.

The law in force very clearly defines that no races shall be held in the State, and the best legal talent holds that this point cannot be dodged and that nothing short of a special act of the legislature would permit the holding of the Vanderbilt Cup race in Connecticut. Yet it is claimed that the governor himself has

stated that he sees no reason why this race should not and could not be held in Connecticut. To make a long story short, if it is possible to have the race here, it is much desired, but if it has to be in defiance of the law, it can work no material good.

It would be far better to see the Vanderbilt Cup event go to Savannah, or to some other city, than to have it come to the Nutmeg State and be the cause of the repeal of the present liberal law. It is too great a sacrifice, not only for the people of the State, but those of other States, New York, for instance, New Yorkers do not find it at all congenial to tour through New Jersey, yet they have some show in Connecticut, and it is desired that present conditions prevail for all time, if possible. "Let us have the Vanderbilt, if possible, but not at the cost of our automobile law," is the slogan. As for courses, there are any number that could possibly be chosen and some of them would be through the smaller towns where there would be no likelihood of interruption from street traffic.

IN PICKING A VANDERBILT COURSE.

When the residents of any community give up their roads for the purposes of automobile contests, it follows as a natural sequence that there must unavoidably be more or less interference with those citizens who are accustomed to use the highways in the pursuit either of business or for the purposes of pleasure.

Therefore, it appears to be a logical conclusion that it is most unwise to place the venue of a big automobile road contest in the county of any State wherein practical unanimity does not exist as to the use of the roads for high speed automobiling. One never knows what may come up to interfere with presumed arrangements, and the recent Briarcliff event with its eleventh hour difficulties supplies a forcible example.

New York City is the metropolis of the country, and it has a natural advantage in all things, including the supplying of thousands of onlookers to any event which may be scheduled to take place in its vicinity. But it is the presence of these thousands of onlookers which compels in the case of an automobile road contest a most thorough guarding of the course, and this only can be accomplished by the presence of uniformed men and possessing authority to forbid for the moment all citizens other than those engaged access to the road.

If it were possible to complete the Long Island Motor Parkway in time for the race, then the selection of New

York City would be a foregone conclusion. But one thing and another has delayed work on the parkway, uniformed men seem an utter impossibility, and gradually hopes are fading away for a 1908 Vanderbilt race in the metropolitan district.

In looking elsewhere for a course, the Vanderbilt Cup Commission is naturally seeking a locality where the residents are entirely favorable and where proper policing of the course is assured. It is an easy matter to pick out roads, and various States can supply excellent stretches of highway. It is another thing to have a unanimous invitation and the certainty of the essential policing. Savannah up to date has given the most substantial guarantees of the several bidders; in fact, is the only applicant that has come forward prepared and ready to do business without equivocation. Connecticut has been mentioned frequently of late as a possible scene for the big international road race. Now it appears that the automobilists of that State are not all of the same mind, and the existing law is quoted as absolutely forbidding such a contest. Connecticut is favored with a most excellent law, liberal in its provisions, but prohibitive in reference to road racing. One can hardly blame its autoists for not running the risk of a revision of the present law, even for the Vanderbilt Cup race.

But the race will be held; Savannah seems to be entitled to an early answer: and there will be a sufficiency of foreign participants, even though the French makers find fault with our non-acceptance of the international racing conditions of the year. We have always raced according to their ideas; now it is their time to race according to our ideas, or refuse to play in our yard. It's pretty good guessing, however, that there will be participants from France, and Italy and Germany, and, perhaps, England.

SHOULD THE CAR BUILDER PROVIDE TOOLS?

Partly as an inheritance from the old bicycle days, when practically every machine was built according to a different standard, and partly owing to the fact that many automobiles still have parts that conform to an exclusive standard, the automobile builder finds it incumbent upon him to supply a certain number of tools with every car that he sells. Ordinarily, these are not confined to a few special spanners to fit those particular bolts or nuts that may differ from other standards, but also include a wrench or two in addition, an oil can and a screwdriver—needless to add, a so-called tool outfit wholly inadequate to the requirements of the car which it accompanies. If the maker feels called upon to supply a tool kit as part and parcel of every car he builds, it only seems fitting that he should fulfill his duty in this respect by providing an outfit of tools worthy of the name, as well as one that is in keeping with the selling price of the car. Naturally, tools do not actually form any part of the car; it is just as complete and just as ready for the road without them, and the maker is reducing his profit on the car just that much by supplying them. In a case where cars are turned out by the hundred, the expense for tools is no small item, and their cost is kept down as much as possible, but rather than send a \$2.50 tool outfit with a \$2,500 car, it would seem preferable to omit this essential from the equipment.

A. A. A. GAINS ITS 24TH STATE BODY—BUFFALO CONVENTION

THE twenty-fourth State association was admitted to the American Automobile Association at the meeting of the national organization's executive committee, held at 437 Fifth avenue, New York City, Tuesday last. This body was the Virginia State Automobile Association. By the admission of the Automobile Club of Little Rock a start was made for a State organization in Arkansas. Reports from various State bodies told of added clubs, especially in the Middle West.

It was decided that instead of designating a single day as "Orphans' Day" throughout the country, that the A. A. A. would suggest the second week in June as the best period in which the various clubs may conduct their annual Orphans' days.

Every club in the association will be asked to send three delegates to the good roads and good laws convention, to be held at Buffalo, July 6, 7 and 8, preceding the start of the annual tour for the Glidden and Hower trophies. Because of this event, the June meeting of the executive committee will take place at Buffalo on Tuesday, June 2.

In the absence of President William H. Hotchkiss, who was unable to attend, First Vice-President Speare presided. Preceding the session, there was a meeting of the special committee

in charge of the Buffalo convention, which promises to be the most important affair of the kind ever held in this country. The governors of all the States will be asked to send representatives and a large attendance is already assured.

In connection with the question of good roads, there will be seen roads in actual construction and also demonstrations of the various kinds of road preservatives, including oil, coal tar and other preparations. Practically all the important road machinery concerns of the country will have exhibitions, and the subject of good roads will be thoroughly covered.

George C. Diehl, county engineer of Erie county, will be the chairman of this "Committee on Practical Road Construction;" Alfred Reeves will serve as chairman of the committee on publicity, and others well qualified will assist Chairman R. P. Hooper, of the Good Roads Board, and Chairman Charles Thaddeus Terry, of the Legislative Board. The National Grange has promised its hearty support, and the president of this big organization, ex-Governor N. J. Batchelder, of New Hampshire, will be one of the speakers. The delegates will be entertained in various ways and work on the various activities is reported to be well in hand.

JERSEY'S BIG CLUB NOW HAS 816 MEMBERS.

NEWARK, N. J., May 4.—At its annual meeting held to-night the New Jersey Automobile and Motor club discussed the new amendments and voted to stand by the State Association of the A. A. A. in any legal fight it might make to test their constitutionality.

The following officers were chosen: President, Paul E. Heller; vice-president, W. C. Crosby; treasurer, Dr. James R. English; secretary, A. B. Le Massena; trustees, William C. Shanley, H. A. Bonnell, F. A. Crosselmire, Dr. F. B. Meeker and A. G. Scherer.

The club has added 130 members to its roll since the last annual meeting and now numbers 816, taking third place numerically among the automobile clubs of the country.

PRESIDENT HOTCHKISS TO BAY STATERS.

BOSTON, May 2.—William H. Hotchkiss, president of the American Automobile Association, came to Boston to-day by invitation of the Massachusetts State Association for the purpose of making an address before the members at the American House. The audience was thoroughly representative, and included two former presidents of the A. A. A., Messrs. Whipple and Lee; First Vice-President L. R. Speare, and representatives of the Wachusett, Springfield, Worcester, Bay State, Malden, and other automobile clubs affiliated with the State association.

President Hotchkiss laid much stress upon the advantages of cooperation among the automobilists of the country, and told of how much more can be accomplished in this way than by purely individual or club effort.

SELDEN FIGURES THAT TELL INTERESTING STORY

TRENTON, N. J., May 4.—The hearing of the petition of the receivers for the defunct Electric Vehicle Company, Halsey M. Barrett and Henry W. Nuckols, regarding the signing of a new arrangement by the Selden licensees with regard to a reduction in the percentage of royalties they are paying, which was to have come before the United States Circuit Court here this morning, has been postponed for two weeks. In the meantime, some interesting facts and figures have come to light. It will be recalled that the receivers state in their petition that the licensees regarded the royalties as excessive long before they refused to pay further amounts to the receivers.

It seems that since the formation of the licensed association the gross royalties paid to the Electric Vehicle Company have amounted to \$1,893,608.93, of which George B. Selden received \$391,333.88, while the E. V. Company's net portion was \$682,274.64, the licensed association receiving \$820,000.41. Here are the figures for the past five years:

	Gross Royalties	Paid to	
		G. B. Selden	E. V. Co.'s Share
1903.....	\$153,783.55	\$33,372.96	\$39,859.05
1904.....	253,273.42	51,762.92	86,435.53
1905.....	413,958.31	79,747.49	150,116.01
1906.....	564,535.24	114,100.67	217,683.56
1907.....	508,058.41	112,349.84	188,180.49
	\$1,893,608.93	\$391,333.88	\$682,274.64

As the result of the failure to modify the agreement regarding the extent of royalties paid, there was a general refusal to continue payments, so that for the quarter ending January 1, 1908, only twelve of the members rendered the usual statements of their business, and only half of this number paid the royalties, so that for the last quarter of 1907 only \$23,779.65 was collected, while for the first quarter of 1908 the receipts were but \$3,828.26. The receivers have considered the advisability of enforcing the royalty agreements by suit, but as the licensees are situated in so many different jurisdictions the plan was deemed impracticable, and a modification of the tariff decided upon. George B. Selden has also certified his willingness to accept \$60,000 a year as a maximum, while the maximum the E. V. Company is supposed to receive annually amounts to \$150,000.

It is hardly considered likely, however, that the mere reduction of 20 per cent. in the royalties payable will be the panacea that the receivers consider it, as if there has been an almost unanimous refusal to pay 1 per cent. on the catalogue price, the chances of collecting 8-10 of 1 per cent., which is the new basis proposed, do not seem overbright. It is thought that the final outcome of the affair will be the sale at auction of the patent licenses in order to make some attempt at reimbursing the 400-odd creditors of the Electric Vehicle Company, whose only source of income is the Selden patent.

OHIO'S A. A. A. STATE BODY OBTAINS THE UNIFORM LAW

CLEVELAND, May 4.—After many wearisome delays, dis-appointments, and reverses, the Motor Vehicle bill drafted by the Ohio State Automobile Association of the A. A. A. has been put through the legislature, and is scheduled for signature by the Governor before this is off the press.

When the news was given out that hereafter Buckeye autoists would enjoy State registration, together with the many blessings in the way of regulations which the bill provided, there was considerable rejoicing, not only in this city, but in Cincinnati, Akron, Columbus, Youngstown, Marietta, Lima, Springfield, Toledo, Elyria, Kenton, and many other cities and towns where there are auto clubs affiliated with the State body.

By far the most important clause contained in the bill is the one which makes fast driving *prima facie* evidence of recklessness. On the face of it, this appears to be drawn up for the benefit of the ruralites only, but it was copied from the Connecticut bill, which is admittedly one of the best in the country, and under which it is almost impossible to operate speed traps or to unjustly persecute motorists. In simple English, this clause of the bill works out in this way: John Smith is going along a country road at twenty miles an hour, and sees in front of him several miles of clear, unobstructed, and unoccupied highway.

He lets 'er go, and while traveling at more than forty miles per his time is taken, and he is hauled before the representative of the law at Squeedunk Corners. Admits going forty miles or better, but claims road was clear and there was absolutely no danger either to himself or any one else. Under the *prima facie* clause of the Motor Vehicle bill it is impossible to secure a conviction in this or similar cases.

Five dollars will be the charge for registration of gasoline and steam cars under the new bill, and three for electrics. Dealers and manufacturers pay a \$10 fee and \$2 for every license number desired. There is no charge for commercial vehicles. Motorists touring in from other States are allowed in this State ten days free—after that they must obtain an Ohio license. All surplus funds, estimated by the Secretary of State to be about \$80,000 yearly, will go for repair and maintenance of roads.

Secretary Forbes, of the Cleveland Automobile Club, and Harry Vail, member of the Legislative Committee of the O. S. A. A., have borne the brunt of the work of getting this measure through both branches of the legislature, while an equal amount of credit is due Senator Ward, of Cuyahoga county, who kindly fathered the bill. Henry H. Hower, secretary of the O. S. A. A., has also done some work at Columbus.

INCONSIDERATE AUTOISTS MAY IMPERIL CONNECTICUT LAW

HARTFORD, CONN., May 4.—Complaints are frequently made that of late autoists do not observe a reasonable speed in passing through settled communities in the State of Connecticut. The work of a few reckless spirits has been reflected upon the whole motoring contingent, and unless the unruly ones come down to earth and act human the Connecticut law will be a thing of fond memory only. A flagrant instance is that of a young man who races from one town to another just to establish a record that means nothing to any one or even the car itself.

The Automobile Club of Hartford has prevailed upon its members to be reasonable in the matter of speed, and the forthcoming

endurance run was altered so that the average speed in miles per hour was materially lowered in order that the law could be complied with and have a little left to spare. Entries are coming along in good shape, and everything points to the success of the initial venture of the club. After much discussion, it has been definitely decided that all tire troubles will be penalized.

The membership list of the club continues to grow, and at the last meeting of the governing board fourteen more applicants for membership were admitted. The new clubroom in the Allyn House has become popular, not only with the members but with visiting tourists as well. A hill-climb will be held in September.

AN EDICT OBNOXIOUS TO BOSTON AUTOISTS.

BOSTON, May 4.—The Metropolitan Park Commission's edict went into effect Saturday against the use of tire chains and armored or metal-studded tires on automobiles driven upon any of the roads under its jurisdiction. As the Metropolitan parkways are among the most popular drives for automobilists, some of them being the principal outlets from the city and the main motor thoroughfares to other sections of the State, the prohibition of chains and armored tires will bear hard upon those automobilists who have been accustomed to use such devices to prevent skidding in wet weather. Furthermore, it is feared that the move of the Metropolitan Park Commission will be imitated by other authorities, such as the Boston Park Commission, which controls the most popular drives within the city, and the Highway Commission, which controls the State highways throughout the Commonwealth.

SPEED-CRAZED AUTOISTS MAKE ADVERSE LAWS.

NEW HAVEN, CONN., May 4.—Local autoists are in a furore over an attempt which is soon to be made in the board of Aldermen to exclude automobiles from certain congested business streets in the center of the city. This attempt follows the instant killing of a little girl a day or so ago by an automobile carrying a party of Yale students—the fourth fatality within a space of five months, in two of which cars driven by Yale men have figured.

An energetic police campaign against speeding has resulted, traps have been set on all the principal thoroughfares, and a large number of Yale men and prominent autoists have been arrested and heavily fined in the police court. Following the most recent fatality, De Forest Hurlbud, of Chicago, a Yale senior, was fined \$100 with costs in the police court for speeding his steam car up one of the steepest hills in the city.

BEWARE OF SPEED TRAP IN WESTFIELD, N. J.

WESTFIELD, N. J., May 5.—There are not a few citizens of this town who welcome the coming and passing of the automobile and would like to see touring through Westfield made a pleasure rather than a pain. One of these is Dr. Frederic Adrian Kinch, who in bicycling days was a very active worker for the rights of cyclists as an officer of the L. A. W. Dr. Kinch has taken upon himself to send out warning of a speed trap that has been laid and working for two Sundays past on Mountain avenue, an eighth of a mile north of the big white Presbyterian church.

BELIEVES AGE LIMIT SHOULD BE INCREASED.

WASHINGTON, D. C., May 4.—Leroy Mark, secretary of the Automobile Club of Washington, has suggested to the District Commissioners that the age limit for operators of automobiles be raised from sixteen to eighteen years. He has pointed out that in many instances it has been proven that a sixteen-year-old boy is not capable of handling a car in the crowded streets. Mr. Mark's suggestion has been approved by many automobile owners, and it is likely the Commissioners will raise the limit, which will also be made to apply to minors operating motorcycles.

AUTO CLUBS ARRANGING SEASON'S PROGRAM

LONG ISLANDERS WILL ENTERTAIN ORPHANS.

NEW YORK, May 4.—Whatever may be the fate of this year's Orphans' Day at the hands of Manhattan, its originator and first promoter, the Brooklyn end of the Greater City is not to permit the time-honored celebration to go by default. The Long Island Automobile Club has already headed the subscription list with \$150 by way of starting the fund. It has also appointed the following committee to go ahead with the promotion and report back to the club at its next meeting its plans: Dr. William P. Richardson, Charles C. Cluff, Louis T. Weirs, and W. T. Wintringham. The Long Island Automobile Club did splendid work last year in seeing that the children of the Brooklyn orphanages were given their annual auto ride to Coney Island and outing at Luna Park.

The New York Motor Club, under whose auspices the first annual outing was given the orphans in 1905, having no longer an active existence, it remains for some other organization or group of individuals to see to it that the celebration is not omitted this year. The New York Automobile Trade Association might well undertake the promotion of New York's end of the observance, and in so doing might enlist the assistance of Alfred Reeves, of the A. M. C. M. A., and Harry T. Clinton, of the A. L. A. M., who would doubtless gladly, on behalf of their respective associations, lend a helping hand to this historic automobile charity. Unfortunately, S. A. Miles, general manager of the N. A. A. M., who for the past two years has practically assumed the individual responsibility and the brunt of the labor of Orphans' Day in New York, is absent in Europe.

The Orphans' Day idea originated with W. J. Morgan, who enlisted the cooperation of the then very active New York Motor Club in putting it through. This was done with so great a success that the clubs of other cities to a considerable extent followed suit until the celebration became so general that last year the American Automobile Association set the second Wednesday in June for a national Orphans' Day. The choice of Wednesday, however, did not prove universally convenient for all cities. In consequence, the clubs throughout the country chose their own dates for the most part, though adhering very generally to June. It is now probable that the A. A. A. will officially set an Orphans' Week, during which an "Orphans' Day" will be recommended to be celebrated by organizations interested in the movement.

QUAKER CITY CLUB'S ORPHANS' DAY, JUNE 10.

PHILADELPHIA, May 3.—Wednesday, June 10, has been decided upon by the Quaker City Motor Club as the date for this year's Orphans' Day run. No objective point has as yet been selected, but as last year's run to Willow Grove was hugely successful, it is highly probable that an effort will be made to induce the Rapid Transit Company, owners of the park, to again extend its free use and that of the many attractions there to the parentless little ones. Last year the number of would-be guests far exceeded the capacity of the more than 100 cars loaned for the occasion, and the committee in charge of this year's affair, under the direction of Chairman H. Lewis, proposes to make an early start in an effort to accommodate all who may wish to go. With this object in view, appeals have already been sent to the other clubs, the branch managers and agents, and to individual owners to cooperate with the committee in making this year's Orphans' Day run worthy of the city.

BROOKLYNITES CELEBRATE SUBWAY OPENING.

BROOKLYN, May 4.—One of the features of the recent celebration to commemorate the opening of the subway extension in Brooklyn was the running of 100 decorated cars by members of the Long Island Automobile Club. Charles Jerome Edwards acted as marshal.

MANITOBANS RECOGNIZE NEED OF UNION.

WINNIPEG, MANITOBA, May 4.—At the annual general meeting of the Winnipeg Automobile Club, these officers were elected for 1908: Honorary president, J. C. G. Armytage; president, Russell M. MacLeod; first vice-president, D. Boyce Sprague; second vice-president, P. C. Andrews; secretary-treasurer, W. E. Wright; committee, R. M. MacLeod, E. C. Ryan, S. M. Belcher, S. C. Dunn, A. A. Andrews, W. C. Power and H. A. Ayhvin; auditors, H. A. Ayhvin and Harry Gooderham. Sixteen new members were proposed and elected, bringing the membership total to nearly 200.

It was decided to affiliate the club with the recently formed Manitoba Motor League, and to hand over to the League a sum of \$2 per head for every member in good standing, in order to make them members of the Manitoba Motor League.

The Manitoba Motor League was formed for the purpose of protecting the interests of all automobile owners in Manitoba and to act as the governing body for all races, endurance contests, etc., held in the province. The league will also arrange for the provision of maps, showing the main routes throughout Manitoba, and will erect sign posts, etc., for the benefit of automobile tourists from other parts of Canada and the American side.

The officers of the League for 1908 are as follows: Honorary president, Hon. Judge Phippen; president, W. A. Elliott; first vice-president, D. Boyce Sprague; second vice-president, Joseph Maw; third vice-president, H. Stevens; secretary, W. R. Bawlf; treasurer, L. R. Barrett; committee: H. A. Ayhvin, E. C. Ryan, F. R. Newman, R. MacLeod, D. W. McDermid, Claude Isbister, H. Rogers, G. Kerr, Dr. Power, T. B. Mitchell, Dr. Montgomery, Mayor Elliott and A. J. Young.

EXCELLENT IDEA OF A. C. OF PHILADELPHIA.

PHILADELPHIA, May 4.—The Automobile Club of Philadelphia is responsible for an innovation which the other local clubs and organizations throughout the State will probably copy in the near future. It is the naming of an Inter-club Relations Committee, whose particular business it shall be to cooperate with similar committees named by other clubs, in forwarding objects in the interests of automobilists in general and in securing uniformity of action thereon.

In a circular issued last week to automobilists generally, the club calls attention to several traps recently located in the country roundabout, and urges everybody to exercise caution, especially when in the neighborhood of these pitfalls, some of which, the circular avers, are designed as revenue producers. Among the traps mentioned is that on the main Philadelphia-New York route, between Highland Park and New Brunswick. Complaints of the treatment meted out to the unlucky automobilists at that point, says the circular, would indicate that this particular trap was "designed for the special purpose of collecting revenue." Other traps mentioned are on the Lancaster pike, opposite the Catholic seminary at Villanova; on Argyle avenue, between Haverford avenue and Lancaster pike, in Lower Merion township; on the stretch of road between Janney station and Langhorne, in Middletown township, and on the road leading through and beyond Hulmeville. The club proposes to issue these warning bulletins from time to time, as complaints are filed.

JOYCE REELECTED PRESIDENT MINNESOTANS.

MINNEAPOLIS, MINN., May 4.—At the annual meeting of the Minnesota State Automobile Association the following officers were elected: President, Frank M. Joyce, Minneapolis; vice-president, Reuben Warner, St. Paul; secretary and treasurer, Dr. W. H. Card, Minneapolis. The annual dues of club members were raised to \$1 per annum. The old rate was 50 cents.

C. H. Kohler, chairman of the legislative committee, presented a report in which he recommended to tax of \$10 or \$20 on every automobile in the State, the money thus raised to be devoted to the making of good roads. The association favored legislation along this line. The association adopted a State emblem, the design representing interlocked wheels with the name of the corporation inscribed on the rims thereof, together with the initials "A. A. A.," for the American Automobile Association, inscribed on the face thereof. It is proposed to add to this emblem the name of each city in which there is a club.

BURLINGTON CLUB BECOMES VERY ACTIVE.

BURLINGTON, VT., May 4.—One of the most enthusiastic and best attended meetings that the Burlington Automobile Club has ever held took place at the Van Ness House last Saturday evening. President Hawley was in the chair, assisted by Secretary E. A. Brodie, and a number of new members were admitted. The chair appointed a committee on by-laws, consisting of W. A. Suydam, C. L. Woodbury, and G. A. Churchill, while Capt. E. P. Woodbury, B. L. Kent, and F. L. North were constituted a committee on good roads, and A. C. Whiting, A. G. Whittemore, and J. S. Patrick were appointed a committee on legislation. Plans were made for a Decoration Day parade, and a banquet, to be held some time during the third week in May. W. A. Suydam, of the *Daily News*, was appointed corresponding secretary.

NEW ENGLAND AERONAUTS DINE AND TALK.

BOSTON, May 2.—The first dinner of the Aero Club of New England was held this evening at the clubhouse of the Boston City Club, and about fifty members and guests were present. Prof. A. Lawrence Rotch presided. Committees were appointed to investigate dirigible airships, and H. H. Clayton was appointed a committee to investigate the cost of placing a club balloon in commission. Charles E. Hellier spoke on the policy of the club, and advocated that it proceed along scientific rather than sporting lines, encouraging the inventors of New England who are working at the problems of aerial navigation. A. R. Shrigley, secretary of the club, outlined the new legal difficulties which will arise when the air is commonly used. Such things as eminent domain, trespass, and the like, will cause much litigation.

LAWRENCE, MASS., CLUB IS FLOURISHING.

LAWRENCE, MASS., May 4.—At the annual meeting of the Lawrence Automobile Club, held at the Essex House, the following officers were elected for the ensuing year: President, J. Frank James; vice-president, Walter Coulson; secretary-treasurer, Harry K. Lawrence. Dr. Charles G. Pierce, James C. Forbes, and Albert S. Lang comprise the board of directors. Among the events planned are regular weekly runs and an Orphans' Day parade. A committee consisting of J. Frank James, John O'Neill, and Charles G. Pierce was appointed to confer with the superintendent of streets relative to grade crossings. The club now has ninety members and is in a flourishing condition.

A BIGGER ORMOND-DAYTONA CLUBHOUSE.

DAYTONA, FLA., May 2.—At the recent annual meeting of the Florida East Coast Automobile Association, J. B. Foster was re-elected president. The other officers elected were: First vice-president, S. H. Gove; second vice-president, J. H. Allen; secretary, T. E. Fitzgerald; treasurer, F. N. Conrad; board of directors, R. M. Bond, A. Hilliard, J. B. Moore, E. F. Oates, H. B. Welch, and T. E. White. It was voted at this meeting to build an addition to the clubhouse and also erect bath-houses.

OHIO'S STATE BODY ACTIVELY PROGRESSIVE.

CLEVELAND, April 4.—The Ohio State Automobile Association is coming in for a great deal of praise these days, for, in addition to organizing an automobile club in Columbus and getting the Motor Vehicle bill through the legislature, a new club has been organized in Kenton. The Dayton club will also reorganize.

THE AUTOMOBILE CALENDAR. AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., and Motor and Accessory Manufacturers, Inc. Alfred Reeves, general manager, 29 West 42d St.
January, 1909.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
February, 1909.....—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Race Meets, Hill Climbs, Etc.

- May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
May 30.....—Boston, Readville Track, Race Meet, Bay State Automobile Association.
May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
May 30.....—Wilkes-Barre, Pa., Giant's Despair Hill Climb, Automobile Club of Wilkes-Barre.
May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers' Association.
June 6.....—Worcester, Mass., Dead Horse Hill Climb, Worcester Automobile Club.
June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-31.....—Austria, Budapest Automobile Show.
May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- May 7.....—Sicily, Palermo, Targa Florio Circuit, Voiturette Race, Automobile Club of Italy.
May 11-16.....—Ireland, Irish Reliability Trials.
May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
May 31.....—Russia, St. Petersburg to Moscow Race.
June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
June 14.....—Mount Cenis Hill Climb, for Voiturettes.
June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club.
June 15-19.....—Scotland, Scottish Reliability Trials.
July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vaucuelen Automobile Club.
Sept. 1-8.....—French Voiturette Contest, auspices of "L'Auto."
Sept. 6.....—Bologna, Italy, Florio Cup Race, Automobile Club of Bologna.
Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

A. L. A. M. TESTS A. C. A. DYNAMOMETER—RESULTS LATER

AS a result of the discrepancy in the showing of the cars of certain of the members of the Association of Licensed Automobile Manufacturers, when tested out on the dynamometer of the Automobile Club of America, as compared with tests of the makers themselves, an imposing delegation from the Mechanical Branch of the Licensed association took possession of the dynamometer testing plant on Tuesday last, at the invitation of the club. The morning was spent in carrying out sundry tests to learn just where the vulnerable points of the apparatus lay, while the checking tests themselves were carried out in the afternoon. It was the consensus of opinion of the visiting engineers that the slip between the drums of the dynamometer and the driving wheels of the car under test was excessive, particularly at the higher speeds, and one of the chief objects of the tests was to learn exactly what this amounted to.

A. L. Riker acted as starter, while Henry Souther was posted at the left-hand driving wheel of the car with a revolution counter, and John G. Utz, similarly equipped, took a position at the right-hand wheel. Hiram Maxim kept watch of the speed indicator and Russell Huff did similar duty at the traction indicator. A Thomas-Detroit 40-horsepower runabout was run on the drums and half-minute tests carried out at speeds of 20, 30, 35, 40, 50 and 60 miles an hour. On the first test the rear wheel turns showed a discrepancy of half a turn, the right giving 92.5 and the left 93—a difference so small as to be accounted for by

errors in reading. Two of the spark plugs cracked and none of the A. L. A. M. standard plugs being available, the Thomas gave way to a Packard touring car which was put through eight different half-minute tests at from 20 to 60 miles an hour. It was succeeded by a Locomobile 45-horsepower roadster, of which Mr. Riker took the wheel, turning over the job of timing to Coker F. Clarkson, while the latter ceded his duties as checker to H. T. Clinton. The differences in the readings at the rear wheels were much greater at the higher speeds, ranging as high as five to ten revolutions apart.

After the Locomobile had been put through its paces at the higher speeds, at which it was found much easier to take accurate readings, as the tapes continually fluctuated, more or less, at the lower rates of travel, and the necessary data carefully noted for reference, the visiting engineers adjourned to one of the committee rooms on the lower floors of the clubhouse to figure out the results of the data already compiled. These calculations will be checked with the figures shown by the tests of the makers on the same cars, just prior to sending them to the club dynamometer for testing. Should any great discrepancy appear, it was the intention of the visiting delegation to undertake further tests to check up the results. The concrete results of the visit will take the form of a report to be made public within a few days, and the contents of the document will be looked forward to with considerable interest by the trade.

PHOTO TOLD TRUTH; CAPTION ERRONEOUS.

An erroneous caption under one of the illustrations on page 596 in THE AUTOMOBILE's story of the Briarcliff race stated that a change of tires was taking place on the Panhard car, which really stopped at the Continental station for a supply of gasoline and water. Anyone who gave this picture a close scrutiny would have noted the fact that nothing was being done to the tires, but gasoline and water were being taken on, for it is a fact that this particular Panhard, fitted with Continental tires, went through the race without any change of tires.

P-S SKIMABOUT OUTPUT IS INCREASED.

It was at first intended by the Palmer & Singer Manufacturing Company, of New York City, to make only 25 cars of its new Skimabout type, but the first car placed on exhibition in the company's salesrooms, 1620-1624 Broadway, has resulted in so many immediate sales that the number will be greatly increased. The Skimabout has 28-30 horsepower and is of short wheelbase, which, its makers state, particularly adapts it to city use, it being turnable in the narrowest streets and well fitted to take advantage of openings in traffic. Its power is ample for country touring and it is capable of high speed. Its price is \$1,950.

Chas. A. Singer, Jr., in the Palmer-Singer Skimabout.

MOST UNUSUAL PHOTO OF THE BRIARCLIFF.

Through an oversight, the excellent action picture of Isotta No. 11 in the Briarcliff race, published in the April 30 issue, page 603, was not marked "Copyright, 1908, Pictorial News Company." The picture was an unusual one, and the Pictorial News Company photographer has reason to be proud of his achievement. N. W. Penfield is the head of this company, the offices of which are located at 138 West Forty-second street, New York City.

MORA MAKES ANOTHER RELIABILITY RUN.

BUFFALO, May 4.—After having had the power plant of a six-cylinder Mora demonstrator, taken from the stock of the Buffalo representatives of the company, officially sealed by Secretary Dai H. Lewis, of the Automobile Club of Buffalo, H. B. Odell started at 11:20 A.M., April 23, for a 1,000-mile reliability run under sealed bonnet conditions. The test was made on the streets of Buffalo and on the roads, 30 to 35 miles outside the city. The run was completed in 47 1/2 hours actual running time, or an average of 21 miles an hour, making allowances for tire repairs. Several press representatives and members of the automobile club acted as observers.

Sealed-bonnet Mora Starting on 1,000-mile Run.

METZGER OUT: BENSON CADILLAC SALES MANAGER

DETROIT, May 4.—Ernest R. Benson, who on April 30 succeeded William E. Metzger as sales manager of the Cadillac Motor Car Company, is, through his former connections, well known to the trade. He was with the Pope Manufacturing Company for twelve years and rose to be secretary of one of the companies connected with them. He was with A. G. Spalding for seven years.

In 1896 Mr. Benson went with the Hartford Rubber Works Company, opening their Boston branch, and soon had charge of the New England territory for that company. He remained with them for eleven years and finally rose to secretary for the company having charge of the commercial end.

His connection with the Cadillac Motor Car Company began December 1, 1907. The Cadillac Company has, during the past few months, made a great many changes in its method of selling, also a large number of changes in their sales organization, and these changes have already accomplished much for the company.

Vigorous methods have been used to post dealers on the selling points and advantages of Cadillac cars. The company reports that this work is showing most gratifying results.

William E. Metzger has resigned the sales management of the Cadillac Motor Car Company, of Detroit. In a brief telegram to THE AUTOMOBILE, Mr. Metzger says that his resignation terminated his connection with the company.

William E. Metzger is one of the pioneers, ablest and most prominent men in the automobile industry. He is second vice-president of the National Association of Automobile Manufac-

turers and a member of the executive committee of the Licensed Association of Automobile Manufacturers.

Like many of the successful men in the motor car industry, Mr. Metzger had the advantage of a preliminary training in the bicycle business. In those days he was also a great salesman, and represented in Detroit at different times several of the leading makes of bicycles.

With the coming of the automobile, Mr. Metzger was early in the new field as Detroit agent for the Columbia and the Winton. In fact, he has always maintained his retail establishment. In 1902 he interested Messrs. Percy, Black, White and Leland in the formation of the Cadillac Company. It had for its foundation the Detroit Automobile Company, which built cars for Henry Ford and was bought by the new company.

Up to two years ago Leland and Faulkner built the engines for the Cadillac Automobile Company as a separate concern. Then the latter company was reorganized under the name of the Cadillac Motor Car Company, the firm of Leland and Faulkner being taken into the new combination.

Mr. Metzger is known as the most experienced and is rated by many as the best sales manager in the automobile trade. His connection with the Cadillac companies has always been in this capacity. Under his sales management Cadillac cars attained an enviable popular and numerical vogue.

Mr. Metzger has not announced as yet his plans for the future. Besides his big retail business in Detroit, he is reported to be financially interested in several motor car making concerns in that city. An announcement is expected.

MICHELIN OPPOSES PRICE CUT FOR CLUB.

Edouard Michelin, of Michelin & Co., the big French tire-making firm, has resigned the presidency of the Automobile Club d'Auvergne, as a protest against the club's alliance with Association Générale Automobile with a view to securing for its members tires at cut prices. In view of a threatened similar movement in this country headed by a club which has loudly protested its policy of fostering the industry, M. Michelin's letter is interesting and very much to the point. It follows:

Grasse, France, 25th Feb.

The affiliation of the Automobile Club d'Auvergne with the Association Générale Automobile, which offers as a special inducement to its members the fact that they will get a rebate on all automobile supplies, in particular tires, is of a nature to cause great prejudice to automobile agents.

I consider this an unfair proceeding against the agents, who are the indispensable contributors to automobilism. It would, indeed, if the public's common sense and justice did not prevail, rob these commercial men of a profit to which they are legitimately entitled, and which is not exaggerated. I, therefore, do not wish to form part of it, not even indirectly.

I do not know what other rubber firms of Clermont-Ferrand intend doing, but, as far as I am concerned, I beg to confirm my resignation, which Mr. Borel handed you on my behalf, when you voted for this new arrangement.

I deeply regret to leave the Automobile Club d'Auvergne, and I can only leave in order not to follow the new track in which it moves.

EDOUARD MICHELIN.

DEMOCRATIC POLITICIANS TO TOUR TO DENVER.

CHICAGO, May 4.—Roger C. Sullivan, Democratic committeeman for Illinois to the convention at Denver next July, has instituted a brand new departure in the political use of the automobile by planning a run to the Democratic convention city from here. The party will consist of a number of congressmen and prominent Democratic politicians, who will utilize four Studebaker cars, while a Studebaker truck will follow the train as baggage carrier. The start will be made June 27.

OPENING OF AJAX-GRIEB NEW PLANT.

TRENTON, N. J., May 5.—The opening of the new additions to the tire factory of the Ajax-Grieb Rubber Company will be celebrated next Monday with no little ceremony. Governor Fort has accepted an invitation to turn on the steam. Many prominent automobilists and tradesmen are expected to take part in the inaugural celebration. The New York party will leave on a special train over the Pennsylvania road in charge of Horace DeLisser, president of the company, while William Grieb will attend to the delegation that leaves on the special from Broad street station, Philadelphia, at 1:40 P. M. The New York party will leave Twenty-third street at 11:55 P. M., and from Cortlandt and Desbrosses streets at 1 P. M. The special trains carrying the delegations will run on the siding alongside the factory, and after the plant has been examined and the visitors shown how tires are made, from the first work on the pure rubber to the finished article, there will be a dinner.

The new buildings are a notable addition to the industrial development of Trenton, and are the best possible proof of the success that Ajax tires have attained during the past few years. The new buildings of brick and cement will add something like 55,000 square feet to the present capacity.

FORD INTERESTS ASK SECURITY FOR COSTS.

An interesting development in the so-called Selden Patent litigation, consisting of the various actions of the Electric Vehicle Company, of Hartford, Conn., now in the hands of receivers, against the Ford Motor Company and others, which is pending in the United States Circuit Court for the Southern District of New York, is brought to light in a motion which will be made by R. A. Parker, of counsel to the Ford interests, through the New York attorneys, Cardozo & Nathan, to have the complainants deposit security for costs, and that the proceedings may be stayed, pending such deposit. This motion is set for hearing Friday, May 8.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

J. Burton Lippincott, the Philadelphia publisher, has become a convert to the six-cylinder idea, his latest acquisition being a six-cylinder Winton limousine.

Harry Knox, of the Atlas Motor Car Company, Springfield, Mass., has just secured an additional order from the New York Transportation Company for 300 more of the two-cycle taxicabs equipped with the special Atlas motor.

The Reo Motor Car Company, Lansing, Mich., has just declared a dividend of 20 per cent. to its stockholders, and, according to the officers of the company, it has had a very prosperous year, while the prospects for the present season are better than ever.

In the description of the Acme igniter, made by the Pittsfield Spark Coil Company, Dalton, Mass., which recently appeared in *THE AUTOMOBILE*, it was stated that the igniter was designed to be used in connection with a vibrating coil. This should have read "non-vibrating," as the igniter is of the synchronous type embodying a high-tension distributor.

Among the American concerns who are already making plans to enter cars in the Vanderbilt race, is the Acme Motor Car Company, Reading, Pa., H. M. Sternberg, the president of the company, being authority for the statement that negotiations have already been undertaken, looking to the engagement of Louis Strang to pilot the Acme entry.

Colonel Sprague, of canopy top and umbrella fame, who has made the town of Norwalk, Ohio, one of the best known places of its size on the map, reports that the Sprague Umbrella Company is besieged with customers, the plant being run to its full capacity every minute of the time, which does not look very much like hard times.

Application has been made by the receivers of the Pope Manufacturing Company, Albert L. Pope and George A. Yule, for permission to continue the business for four months from April 28. They will also ask the court to pass on their semi-annual report, showing receipts of \$900,743, disbursements of \$822,952, and a balance of \$77,791. The receivers report that business is satisfactory and that there is a substantial demand for new cars.

The verdict against the Matheson Motor Car Company, Wilkes-Barre, Pa., in favor of Fred S. Dickinson, of New York, granting him \$16,000 of the stock of that company, which he claimed was due him for services rendered by him in behalf of Charles R. Greuter in securing the latter his position with the Matheson Company, was set aside by Judge Archibald on April 30, sitting in the United States Circuit Court for the District of Pennsylvania, at Scranton.

February and March, 1908, were the best months that the Firestone Tire & Rubber Company, Akron, O., has had in its manufacturing career, while April has eclipsed all sales records. The central section of the new Firestone plant has just been completed, and the machinery for the manufacture of both solid and pneumatic tires has been installed. It replaces the one story structure which was the original factory, and is the fourth and largest addition of its kind to a factory devoted to the

manufacture of rubber tires, that has been made in this country in the last four years.

To those who know the road conditions, the new record from San Francisco to Los Angeles, Cal., made by a 30-horsepower White steamer, is considered a remarkable performance. The trip is 478 miles and was made in 17 hours and 17 minutes, 56 minutes better than the previous record, which has stood for over a year. Since autos were introduced on the Pacific slope the road record between these two cities has engaged the activities of ambitious California drivers, as the holding of the record gives a big prestige to the successful car. The road traveled is of dangerous character and presents many obstacles to rapid travel.

One of the most interesting entries in the A. A. A. reliability tour this July, is a regular stock model 15, Elmore touring car, which was received by the San Francisco agents of the Elmore company, March 3, 1906. This car is the holder of a big string of records, and it is the purpose of its makers to have it continue its triumphant way. It has been driven in every race meet, road race, hill climb and endurance run in southern California, since the time it was sent to that State. In every endurance run, it has made a perfect score,

On the Briarcliff Course.

How the National Sales Corporation utilized an advantageous opportunity to show the public what they sell.

and in the 50-mile motor derby at Los Angeles, May 12, 1907, it won the cup from a number of competitors. Its next victory was on the occasion of the 30-mile Lakeside motor derby race, in which it made the 30 miles with full load in regular touring order, in 39 minutes. To date it has run 16,000 miles without being taken down, or having had its bearings touched. It will be run to Cleveland this summer and after finishing the reliability tour, will be returned to Los Angeles in time to take part in the Mount Baldy race.

RECENT TRADE REMOVALS.

The Isotta Import Company moved from its old quarters at 12 West Thirty-third street, to the Palmer & Singer building, at 1620 Broadway, C. M. Hamilton, manager of the company, having found a location on "automobile row" a necessity.

NEW AGENCIES ESTABLISHED.

The firm of Stude & Farrow, which was recently organized to handle the Groux car in Boston, has established headquarters at 94 Massachusetts avenue.

Benjamin Gerdelman has just been appointed the St. Louis representative of the

Jones Speedometer Company and will look after the interests of this firm in St. Louis and vicinity. Mr. Gerdelman will still retain his agency connection with the Witherbee Igniter Company, with whom he has been associated for a number of years.

Frederick Phillips, Jacksonville, Fla., has taken on the Franklin line for that city and vicinity and will handle that line of cars exclusively. The automobile business is a new venture for Mr. Phillips, who is a well-known civil engineer, formerly of Utica, N. Y., but is now engaged in building a concrete retaining wall along the St. John river in Florida, which will reclaim land estimated to be worth \$240,000. He will build a fine garage and salesroom and give the business much of his personal attention.

PERSONAL TRADE MENTION.

C. M. Strieby, formerly with the Ford Motor Car Company, and president of the Ford Motor Club, is now connected with the sales forces of the L. J. B. Company, Philadelphia agents for the Thomas line.

B. C. Hamilton, formerly vice-president of the Hamilton Automobile Company, Chicago, has just joined the agency forces of the local Studebaker representatives, and will act as manager of the sales department in that city.

E. M. Beauchamp has just been added to the sales department of the E. R. Thomas Detroit Company, and will act as assistant to Manager Whipple. Mr. Whipple was formerly connected with the Locomobile Company.

John S. Johnson, formerly champion cyclist and skater, who was lately assistant to Manager Earl Kiser, of the Pittsburg branch of the Winton Motor Carriage Company, has been appointed Winton sales representative for Minnesota, and will take up his duties in that field at once.

Edward B. Busby, formerly with the Midvale Steel Company, has recently become associated with the selling department of the Electric Welding Products Company, Cleveland, O., formerly the Cleveland Cap Screw Company. Mr. Busby has quite a wide acquaintance among automobile, engine and machinery manufacturers.

B. J. Dollins, for the past two years associated with the Continental Tire Company, has just severed his connection with that concern to join the selling forces of the Pennsylvania Tire Company. He will act as traveling representative in the western territory. According to W. D. Rockwell, sales manager of the company, a western branch house is shortly to be established in Denver.

George Salzman, for six years assistant superintendent of the E. R. Thomas Motor Company's factory at Buffalo, has just resigned from that post to become treasurer and general manager of the American Motor Car Company, of Atlanta, Ga., sales agents for the Thomas Flyer. Mr. Salzman's driving won him many friends on the occasion of the Savannah races, and the Atlanta company placed a \$65,000 order on condition that Mr. Salzman was to be released to take the management of their company. Should the Vanderbilt race take place on the Savannah course, Salzman will have the wheel of a Thomas.

NON-SKID

RUBBER TREAD

Bailey's "Wont-Slip" Tread Tires For Automobiles, Motor Cycles and Bicycles

On sale by dealers everywhere

SKIDDING that one terrifying moment when if your car had been equipped with BAILEY'S "WONT-SLIP" TIRES the accident would not have occurred. Moral "DO IT NOW" and you will avoid such accidents. You see them everywhere. Ask the rider, he knows. There is no metal in the Bailey Tread to heat the tire, pull loose from the rubber or tear the road bed. Bailey Tires are not excluded from the Parks or... The rubber studs of the Bailey Tread are the true principle that give perfect traction and prevent skidding. They are to the automobile what the rudder is to the ship. Write us for descriptive booklet.

N. B.—The extra cost of the Bailey Tires on the list more than smooth of same make is 2 1/2 and 3 in., \$1.50 each; 3 1/2 in., \$2 each; 4 in., \$2.50 each; 4 1/2 in., \$3 each; 5 in., \$3.75 each. C. J. BAILEY & CO., Patentees, 22 BOYLSTON STREET, BOSTON

THE AUTOMOBILE

The Pathfinder left Buffalo, Friday, May 1, carrying Dai H. Lewis, secretary of the A. A. A. Touring Board; Leon Myron Bradley of New York; N. Lazarnick, official photographer, and Ray McNamara, driver of the car.

The run from Buffalo to Erie was through seven inches of snow and mud and a stinging wind was sweeping in from Lake Erie. The trip will take the tourist through fifty miles of the great vineyards and wine cellars of Western New York State. The first bad stretch of road was struck while going through the Indian Reservation outside of Buffalo. For twelve miles the roads were in terrible condition. Both rear chains were thrown off. The highways in dry weather should make excellent touring, and it will be through a flat, rolling country with sandy and clay roads in spots to the Hotel Rider, Cambridge Springs. The only sunshine which the Pathfinder saw in the first eight

TO the lover of Nature and he who delights in gazing at towering mountains and upon low sweeping valleys, watered by beautiful rivers and along whose banks live the thrifty Pennsylvania "Dutch" farmers, the "1908 American Automobile Association Reliability Touring Contest" for the Glidden and Hower trophies will eclipse any preceding tour in grandeur, magnificence, and exhilaration.

While it is true that last year's route took the tourists through a section of Western Pennsylvania, the route being laid out by the big six-cylinder Premier Pathfinder is far more pleasurable than that of 1907. The route as laid out for the first five days by Secretary Dai H. Lewis, of the A. A. A. Touring Board, is as follows:

- First day—Buffalo to Cambridge Springs
- Second day—Cambridge Springs to Pittsburg
- Third day—Pittsburg to Bedford Springs
- Fourth day—Bedford Springs to Harrisburg
- Fifth day—Harrisburg via Philadelphia to Milford, Pa.

Practically one-quarter of the tour has been laid out, as two thousand miles will be covered by the Gliddenites on the "Leap Year Tour."

No one but those on the Premier Pathfinder can realize what the car and the passengers have been through, unless it is those who have participated in the New York-Paris race. Time and again the car has plunged through mud, slush, and snow, many times sinking to the running board; at other times the axles have been buried in soft, clayish mud. With the exception of the Lackawanna steel works outside of Buffalo and a one-hundred mile run along Lake Erie, the trip from Buffalo to Cambridge Springs has little interest.

days was while at luncheon at the Hotel Rider. When the car was on the way, a snowstorm, which developed into a blizzard, continued during the afternoon, as far as Mercer, Pennsylvania. The thermometer registered only thirty degrees above zero. The glass front had to be lowered so that the driver could see the nature of the road ahead of him.

The worst roads of the distance already covered were encountered between Mercer and Pittsburg. From Harmony to the plank road, fourteen miles out of Pittsburg, about six miles an hour was averaged. The first cars which the Pathfinder saw between Buffalo and Pittsburg were met on the plank road, but none were seen on the country roads between Buffalo and Carlisle (famous for the Indian school) except a White, a Stanley, and a Pullman, which carried a delegation from the Harrisburg Motor Club, who came out to Carlisle to meet the Pathfinder and pilot them into the city. At the end of the plank road in Pittsburg, the Premier Pathfinder was met by E. L. Seeley, Pittsburg agent for the Premier car. The entrance of the Pathfinder into Pittsburg was a continual ovation for the mud-besmeared car.

Going from Pittsburg to Johnstown, the coal belt of Western Pennsylvania is traversed. At Export and Salemville, the coal and coke regions of H. C. Frick are passed. Here the burning coke ovens with their flames leaping scores of feet into the air can be witnessed by the tourists.

This year's run from Pittsburg west will take the tourists into Johnstown by the way of Alexandria, Blairsville, and Cramer. Eight miles west of Johnstown, the Cramer pike is struck, being the first stretch of macadam road which was seen between there and Buffalo. The road is along the Conemaugh

Encountering a May Snowstorm at Mercer, Pa.

"The Sheep Upon a Thousand Hills" Preceding Us.

river and through Laurel Hill Gap and Pack Saddle Gorge. It was down this river and through the gap and gorge that three thousand victims of the Johnstown flood were swept to eternity. The scenery through this territory is one of grandeur and admiration. It is in this section that the most picturesque route of the Pennsylvania railroad is situated. The famous stone bridge in Johnstown, which caused the great flood, will be passed

by the Gladdenites. It was there that the wreckage piled up and caused the water to back up into the city. The road goes by the Cambria Steel Works, the largest steel concern in the world, which employs twenty-two thousand hands. Johnstown is the pioneer town in the iron industry, its first plant being operated in 1560.

The Johnstown Automobile Club is instrumental in having the tour pass through that

section of the country. Their representative told Mr. Lewis that they would do all in their power to have the roads in the best of condition, and will post all bad and dangerous turns in the vicinity of Johnstown. The club sent a representative to Pittsburg to pilot the Pathfinder into Johnstown, and this representative continued with the party several miles out of Johnstown on the road to Bedford Springs. The scenery in the vicinity of Johnstown is excellent. Great towering peaks are on

one side of the highway, and in many places one can look down several hundred feet on the Conemaugh river.

The roads from Johnstown to Harrisburg are sandy and of red clay. The road from Johnstown to Bedford Springs is by Winber, Pleasantville, and over the Allegheny mountain. This is a more northern road than was taken last year. The Allegheny mountain is the highest peak of the Allegheny range and is struck about twelve miles west of Johnstown. The top of the mountain is a wild, barren waste of land, the timber having been cut off. The road over which the tourists will pass is the original roadbed of the timber railroad. The mountain is infested with black bear, wildcats, mountain sheep, and other wild animals. For five miles the Pathfinder drove through clouds so thick that the acetylene lamps had to be lighted. An altitude of 2325.6 feet was reached. On coming down the mountain, extreme carefulness will have to be exercised by the drivers in the contesting cars, as a skid of three or four feet would mean the hurling of the automobile to a deep ravine, something like one thousand feet below. The roads are very rocky with many dangerous curves. From the foot of the mountain to Bedford Springs, clay predominates. If the tourists have to drive over this road after two or three days' rain, the going will be hard and many cars are likely to be put out of the running.

The first real good roads and the first opportunity at speeding since the Pathfinder left Buffalo was on the macadam road from Bedford Springs to Harrisburg. The tourists will be taken from Bedford Springs over the same route as last year, as far as McConnellsburg. From Breezwood to McConnellsburg, a distance of seventeen miles, it is one long steady climb and coasting. The course is filled with many road breakers, which Dai Lewis has jokingly termed "marcelle waves." To the automobilist, these car breakers will prove to be terrors and extreme care will have to be used. From Breezwood to McConnellsburg

Secretary Lewis Deliberating.

Thumping Over the Plank Road Into Pittsburg.

In Front of Soldiers' Monument at Blairville, Pa.

the Pathfinder coasted for a distance of three miles, the throttle never being disturbed in covering the entire stretch down hill.

Going west from McConnellsburg to Harrisburg, the road is through Chambersburg, one of the most beautiful towns in Pennsylvania. In 1864 the town was destroyed by Confederate cavalry. The road is very excellent; the highways are lined with massive maples and large old residences, surrounded by spacious lawns. The country is flat and rolling to Harrisburg. The roads are in excellent shape and the tourists can cut out a rate of fifty or sixty miles an hour without police interference. On each side of the highway are beautiful farms with fertile soil. Wilson College for girls is passed, and from there on level hard roads lead into Carlisle, past the Carlisle College, made famous by the Carlisle Indian football team.

Between Pittsburg and Harrisburg, no "speed limit" signs were seen. The only drawback to this course is the great number of tollgates through which the tourist must pass.

The fifth day's tour from Harrisburg to Milford will take the cars through Lebanon, Reading, Allentown, Bethlehem, and Easton, along the Delaware river, through the Delaware Water Gap and over the Blue Ridge mountains. The highways through Lebanon, Reading, and Allentown cannot be surpassed. Nowhere in the country, not even the famous New England State highways can surpass those over which the Glidden tourists will pass. After passing Allentown, soft clayish mud was struck, which made the going very slow for the Pathfinder. Time and again through this district, the car again sank to its running board and axles. One automobile was passed outside of Easton, being hauled through the mud by a pair of mules.

The sixth day's run from Milford will probably terminate at Albany, New York, although this has not been definitely decided upon by Secretary Lewis. Just where the route will go from Albany is uncertain, but it is safe to say that the finish will either be at Saratoga Springs or Buffalo. New England will be visited quite extensively.

PHILADELPHIA IN TOUR; NEW JERSEY AVOIDED

The route of the A. A. A. tour was changed on Monday last so as to include Philadelphia and still avoid New Jersey. Secretary Dai Lewis had reached the Delaware Water Gap, but Chairman F. B. Hower directed that he go back to Harrisburg and lay the route from there to Philadelphia.

The reason for eliminating New Jersey from the route of this year's tour is the motor law of the State. It was originally planned to run from Philadelphia to Atlantic City and spend Sunday at that resort. It would have cost the contestants about \$13 license fee for each car, however, for the two days, and so the State was avoided, and, instead of getting a reasonable fee, like other States, it will get nothing. Its principal resort will likewise be minus several thousand dollars that the tourists would have spent there but for the attitude of the State's lawmakers toward those who use automobiles.

CINCINNATI CLUB IS SIGN-BOARDING ROADS.

CINCINNATI, O., May 11.—The Automobile Club of Cincinnati is busying itself with numerous activities at this season of the year, not the least important of which is the marking of the roads throughout the entire county. The opening of the new clubrooms in the Gibson House, which took place a few weeks ago, proved a veritable magnet, and the membership of the club has been increased by fully 100 recruits, Dr. C. L. Bonifield, the president, stating that the club has never been in such a flourishing condition before. The runs and tours committee is at present working on a hill-climb to be held May 23, and is also laying plans for an orphans' day in June.

AUTO ENTITLED TO HALF THE ROAD.

ERIE, PA., May 11.—It is not often that statutes dating back as far as 1820 have to be invoked in the trial of a case involving

Among the Coke Ovens at Portersville, Pa.

Moore, attorney for the Erie Motor Club, looked up the old statute and found that it provided for a penalty of \$20, which Hower was fined, together with the costs.

FERRY TO BENEFIT SOUTHERN TOURISTS.

PERRYVILLE, Md., May 11.—Now that a ferry is plying regularly between this place and Havre de Grace, tourists coming this way will no longer be subjected to the inconvenience of having to load their machines on a flat car and have them hauled across the railroad bridge. The first boat in the morning leaves here at 6:15 A.M. and the other side at 6:30, the schedule thereafter being half hourly until 8:45 P.M., the boats being run an hour later on Saturday, while the Sunday hours are from 8 A.M.

FACTS ABOUT THE A. A. A. BUFFALO CONVENTION

BUFFALO, May 11.—Preceding the start of the annual A. A. A. tour from Buffalo, the national association will hold its first "Legislative and Good Roads Convention," in the preparation of which splendid progress is being made. Briefly outlined, this is the program that has been mapped out:

Monday, July 6.—Arrival, reception, and registration of delegates at the Iroquois Hotel, and special side trips to Niagara Falls, which is only 20 miles from Buffalo.

Tuesday, July 7.—Address of welcome by Mayor J. N.

Adam, with a morning session devoted to a discussion of "Uniform Automobile Legislation," under the direction of Chairman Charles Thaddeus Terry and members of the A. A. A. Legislative Board.

In the afternoon the subject of "Good Roads" will receive attention under the supervision of Chairman Robert P. Hooper and members of the Good Roads Board. State Highway Commissioners Hunter, of Pennsylvania; McClintock, of Massachusetts, and Skene, of New York, will be included among the speakers. In the evening the delegates will be entertained at a vaudeville performance at Shea's Theater.

Wednesday, July 8.—"Good Roads" will be further considered at the morning session, and early in the afternoon the delegates will be given a tour of inspection over new roads under construction in and about the city. County Engineer George C. Diehl, of Buffalo, is the chairman of the Committee on Practical Roads Construction. Demonstrations will be included by road builders on the maintenance and preservation of the highways, illustrating various methods for making roads dustless.

In the evening will come the banquet at the Iroquois Hotel, with President William H. Hotchkiss presiding. It is expected that Governor Hughes, of New York; Governor Stuart, of Pennsylvania, and Governor Harris, of Ohio, will be among the speakers.

Thursday, July 9.—Start of the Fifth Annual Reliability Touring Contest of the A. A. A., including the contests for the Charles J. Glidden trophy for touring cars and the Frank B. Hower trophy for runabouts, which will lead the tourists through 2,600 miles of picturesque country.

An Archaic Toll Gate Just Before Entering Harrisburg.

Coal Tar Treated Roadway South of the State Capitol at Hartford, and Leading Out of the Capitol Grounds.

HARTFORD, CONN., May 11.—In the matter of improved highways, Connecticut has won an enviable position, and this is due in a great measure to the tireless efforts of State Highway Commissioner James H. Macdonald. It is the sole ambition of this official that before he shall have terminated his office and relinquished the reins to his subordinates that the State will be dotted everywhere with faultless highways. At the present time the roads of the State are, for the most part, very good, and the commissioner is ever active in an endeavor to eliminate the bad spots. But, like all other sections of the universe, Connecticut has the dust evil to overcome, and how to obliterate the nuisance is a phase of the situation to which the commissioner has given much thought and consideration. Last summer, for instance, crude oil or asphaltum was tried, and the results were quite satisfactory. Yet, anything that savors of improvement receives due consideration.

The commissioner is of the opinion that coal tar is about as efficient a road preservative and dust layer as there is to be had at this time. Some time ago the beautiful macadam drives which surround the State capitol at Hartford were treated to two coats of coal tar. Needless to say, these tar stretches have worn very well and resisted automobile traffic. The commissioner firmly believes that automobiles must necessarily have a deleterious effect on the highway, for he drives a car himself, and, likewise, is aware that dust is an evil to be banished.

When a representative of *THE AUTOMOBILE* called on Mr. Macdonald and asked him what he thought of tar roads, he took the inquirer to his office window, overlooking the roads, and remarked: "There they are; you know when they were laid. How do they look?" But the mere fact that someone was in quest of road knowledge rendered the commissioner all action, for he will resort to all sorts of methods to make one fully comprehend. He described the processes necessary for the construction of a tar road according to the specifications of the highway commission.

For instance, the tar may be applied only on a very hot day, and only after the dew is off the ground. First of all, the contractor who undertakes the work must pare down and shape all gutters in conformity with the original cross-section of the road. All cleanings and scrapings must be removed well to one side of the road to be treated. After the shoulders or gutters have been formed and shaped, all dirt or accumulations must be cleaned off, and for this purpose split rattan brooms must be used. The process of scraping and cleaning is carried on until the No. 2 stone is entirely exposed, and clean and free from all foreign material, so that there shall be no interruption between No. 2 stone and the primary coat of coal tar. Any toe marks,

ruts or depressions that may exist must be thoroughly swept out, and must be filled in with stone previously coated with coal tar. The coal tar used to saturate the road surface must, according to the State specifications, have about 15 per cent. of pitch melted into it, so that the pitch will become liquified and thoroughly mix with the tar. The stone used for repairs must not exceed one inch longest diameter, and shall be placed in such depressions as may be, and thoroughly rolled into the original fractures. Before the stone is applied to fill ruts and the like, the depressions must be slush treated to a coat of coal tar. After the road has been cleaned thoroughly, and all fractures repaired, the primary coat of tar is applied to the travel path.

The tar used must have been heated to 225 degrees Fahrenheit before application. After the tar has been flodded on the road, it must be broomed in thoroughly with heavy split rattan brooms. When the road surface has sufficiently absorbed the initial coat of tar, a second application is made. This must also be heated to 225 degrees Fahrenheit, applied in the same manner, and thoroughly broomed in, so that all interstices and voids

Making Turn at 25 Miles per Hour, Without Dust.

Tar Road on North Side of Capitol at Hartford.

The smooth, even surface is very noticeable. Automobile traffic is very heavy at this point, as this road is used as a short cut in circling the Capitol grounds.

will be completely filled. Following closely on this second application of tar is a treatment of chips, or, more properly speaking, of splinters of clean trap rock not exceeding 3-4 of an inch longest diameter. This layer of fine stone or splinters must be

applied while the tar is hot, and the depth must be at least one inch. Immediately after the application of the stone splinters, the entire surface is rolled down to thoroughly imbed the covering in the second coat of tar.

No water-gas tar may be used, nothing but pure coal tar being permitted by the commission. As previously stated, the day when the tar application is made must be dry and hot, and the road must likewise be very dry. No tar is permitted to be applied when indications point to a storm, or in the event of a storm, until twenty-four hours thereafter. The barrels containing the tar, before the tar is put in the kettles, must be laid on the sides, bung up, for not less than five hours, so that all water contained in the tar will come to the surface, and this must be removed before the tar is placed in the kettles. Only new and fresh stones and splinters can be used. A ten-ton steam roller is used to roll down the surface after the splinters have been applied.

It will be noted that the foregoing specifications are somewhat rigid, and roads constructed in conformance therewith should render the maximum of service. According to Commissioner Macdonald, the tar roads that surround the State capitol are absolutely waterproof at all seasons. These roads are perhaps more extensively used by automobiles than by horse vehicles, and just how well they wear is shown by the accompanying photographs. Every dealer in town who has a machine out for demonstrating purposes includes in the itinerary a run over these roads. Thus it will be seen they are much traveled. They are free from dust and present a smooth, hard surface. The commissioner contemplates treating other roads throughout the State with tar during the coming season.

AN EXPLANATION OF WHAT COAL TAR IS MADE FROM

SO much interest has been aroused by the successful experiments in road preservation and dust-laying with the aid of coal tar that many would like to know what coal tar is, and just how it is produced. A little inquiry is sufficient to show that the average man has not the faintest conception of what this product is, so that the following information, gleaned from a recent report of the Bureau of Forestry, is timely.

Macadam Road Leading Northward from the Capitol.

This road is not tar treated, and the difference between the road shown above and this one is very noticeable, when comparisons of surface are made.

Coal tar is composed partly of the substance known as carbon, and partly of compounds of this carbon with the gas hydrogen, and which are known as hydro-carbons. When the coal tar is heated sufficiently, away from the air, the hydro-carbons are driven off in the shape of a gas. Illuminating gas is made by subjecting coal tar of the proper kind to this process, which is known as "dry distillation." The coal is put into a long, fire-clay oven, or retort, shaped much like a giant model of the cake commonly known as "lady fingers," the retorts being about 13 feet long, 2 feet wide and 16 feet deep. A number of these retorts are built side by side, in three rows, one above the other, the ends being supported on a brick wall, which also extends around the ends of the rows and over the top.

Fire, from furnaces below, is carried by flues into this enclosure, so that the retorts are entirely enveloped in flame, and can be heated to a very high temperature. The retorts are partly filled with coal and then sealed to exclude the air. They are then heated to a temperature of about 2,100° Fahrenheit. Under this intense heat, almost all the hydro-carbons pass off, leaving behind only the "fixed" carbon, in the shape of coke. As the gas comes from the retorts, it is a thick, yellowish green smoke, and must be passed through a series of costly machines before it can be used. Many of the compounds distilled will remain in the form of gas when cooled to ordinary temperatures when the original gas is cleansed from its impurities. In the condensers, which cool the gas, the heavier compounds are left behind in the shape of thick liquids.

The heavy, strong-smelling black liquid left behind by the first cooling is what is commonly known as coal tar. This is an exceedingly complex mixture of substances, from which are obtained costly perfumes, dyes, medicines and a host of other things, including flavoring extracts. Coal tar is also produced by what is known as the by-product coke oven, used for the production of coke for steel making. In recent years, gas has been made very largely by another process which produces what is known as "water-gas." This process also produces tar that is very similar to coal tar and difficult to tell from it.

EXPERIMENTS OF THE OFFICE OF PUBLIC ROADS

WASHINGTON, D. C., May 11.—The subject of dust prevention, owing to its relation to road preservation, is of vital importance to the road builder. The Office of Public Roads carried on a series of experiments during the summer of 1907, with a view to determining, if possible, the relative value of various dust-laying preparations and crude products, and their adaptability to different conditions. The project embraced many details, and, owing to lack of funds and the difficulty in finding one road suitable for all kinds of experiments, had to be somewhat modified in the final plans and the work divided among three localities.

It was learned that the highway commission of Massachusetts intended to treat a stretch of road leading into Boston with tar preparation, and arrangements were made by which the Office of Public Roads could carry on a number of experiments on sections of this road. The road selected for the experiment was a mixed trap, and granite macadam in the township of

ture, and contained a good pitch base. The special coal-tar product was supplied free of charge by the manufacturing company in fifty-gallon barrels. It contained no water, was free from the extremely volatile oils present in the crude tar, and held a good pitch base.

The tar was applied during the month of August, and only in dry, warm weather. The method, in general, was as follows: All loose materials, dust and detritus were first removed by repeated trips of the sweeper, just before the application of the tar. Hot or cold tar, according to the experiment, was then spread upon the clean, dry road through a hose connected to the kettle, or tank wagon, as the case might be. Laborers followed the kettle, spreading and working the tar into the road surface with stiff, long-handled brooms. As the road could not be closed to traffic, it was found necessary to throw on a light covering of gravel or screenings almost immediately, in order to prevent passing automobiles from picking up the tar, although

Experimental Stretch of Coal Tar Treated Road at Savannah, Ga., on Henry Street, Looking Westward into the Suburbs.

Weston and Wayland, which had been built about ten years previously, and had but few repairs since that time. It is part of the main thoroughfare connecting New York with Boston, and is located about sixteen miles from the center of the latter city.

The automobile traffic is, for this reason, heavy, and this, in addition to teaming and other traffic, had produced serious results. In some cases, the macadam was completely broken through. There were many rut holes, some of them thirty feet long, and averaging from one to three feet in width, and a large number of smaller holes more clearly circular in shape. Over almost the whole road surface numerous small depressions or worn places were visible, and practically all of the fine material was being removed by traffic as fast as it was formed. The No. 1, or large stones, protruded above the surface, and in many cases were scattered loose, making the road extremely rough.

Sections of this road as nearly alike as possible were selected for the experiments, which were made with water-gas tar, crude coal tar, various mixtures of the two applied in different ways, and a special coal tar product.

The water-gas tar was obtained from a local gas company at \$1.50 per barrel of fifty gallons, delivered. It was a thin, oily liquid. The crude coal tar was also obtained from a local gas company in fifty-gallon barrels, at \$2 per barrel, delivered at Wayland. It had been produced at a comparatively low tempera-

ture, and contained a good pitch base. The special coal-tar product was supplied free of charge by the manufacturing company in fifty-gallon barrels. It contained no water, was free from the extremely volatile oils present in the crude tar, and held a good pitch base. The tar was applied during the month of August, and only in dry, warm weather. The method, in general, was as follows: All loose materials, dust and detritus were first removed by repeated trips of the sweeper, just before the application of the tar. Hot or cold tar, according to the experiment, was then spread upon the clean, dry road through a hose connected to the kettle, or tank wagon, as the case might be. Laborers followed the kettle, spreading and working the tar into the road surface with stiff, long-handled brooms. As the road could not be closed to traffic, it was found necessary to throw on a light covering of gravel or screenings almost immediately, in order to prevent passing automobiles from picking up the tar, although

it would have been much more satisfactory and productive of better results could the tar have been allowed to dry for a number of hours before applying the surface dressing. Finally, enough of the covering material was added to take up the excess tar and produce an even surface, and the whole well rolled with a twelve-ton steam roller until firm and smooth. When gravel was used, it was obtained from pits located near the road, and cost the highway commission about \$1.08 per cubic yard, during the time covered by the work of the office.

One-half inch clean trap screenings or pea stone, however, was used whenever it could be obtained, and was furnished at \$1.10 per ton by a rock-crushing plant located about four miles from the nearest section of the work. Thirteen different experiments were made, four with water-gas tar alone, three with coal tar, three with mixtures of water-gas tar and coal tar, and three with special tar preparations. Nearly all of the sections were in good condition when they were inspected in November. It is impossible at the present time to make decided comparison of the value of the different surfacings, but, undoubtedly, after the cold rains and the frosts of winter, conclusions may be reached as to the worth of each one, for these agencies are the worst enemies of work of this kind. Some facts of interest have already been noted which it may be well to mention at this time.

It has been shown that water-gas tar is a satisfactory dust layer and preventive when used in moderate quantities on

Another View of Henry Street, Savannah, Looking Cityward.

roads already in fairly good condition. It can undoubtedly be applied to the best advantage by means of an ordinary sprinkling cart on the unprepared road, and when used in this way serves to make the road surface firm and keep down the dust for some time at a very reasonable cost. Its odor is objectionable, but soon disappears. It must necessarily be applied more frequently than the heavier tars, owing to its lack of body. Where extensive repairs have to be made before, it has but little value as a binder for the large, loose material, and whether its use even in large quantities will be satisfactory for this purpose and for holding down a heavy surface dressing is a matter for the future to decide.

At the present time some of the experiments with crude coal tar show up favorably in comparison with the work with special preparations, but time is needed to decide definitely upon their relative merits. As regards application, the special preparation has the advantage over crude coal tar in being less inflammable and less likely to boil over the sides of the kettle if heated too high, but, on the other hand, its cost is considerably greater.

Two criticisms which have already been offered by farmers to both of these products are that the traction of heavily loaded wagons is increased, and that in frosty weather the road is made very slippery and offers but little foothold to horses. While the mixtures of water-gas tar and coal tar, with a light dressing of trap screenings give better results in these respects, it is impossible at the present time to say that their use will prove as satisfactory or economical in the long run. A material which can be applied cold is much easier to handle than one requiring heat, but, of course, the latter has the advantage of containing more binding material or base. Where surface dressing is needed the use of clean one-half inch screenings is certainly to be preferred to gravel, as less rolling is required and a better wearing surface is produced.

The surface treatment of roads with tar is more a palliative than a preventive of the dust nuisance. Some more permanent treatment of the road is essential for lasting results. It is the intention of the Office in the near future to carry on experiments along the latter line, with the use of a well-tarred sand to supply a part of the binding material and to fill the voids. One of the most promising methods with respect to cost which has suggested itself is to apply a layer of this tarred sand to the bottom course of No. 1 stones, which should first be well rolled. The second course of No. 2 stones should then be applied, and the whole rolled until the sand has been thoroughly worked into both the upper and lower courses. A surface application of tar should then be put on and sufficient sand or fine stone chips spread to bring the surface to a smooth and uniform condition when rolled, so that the whole structure will be firmly bound and proof against the usual rapid disintegration.

SAVANNAH'S ROAD TARRING EXPERIMENTS.

SAVANNAH, GA., May 11.—As the result of the very successful manner in which that portion of Henry street treated with "gas house" coal tar more than six months ago has stood up, more work along the same line has been done. The first experimental stretch of road has been extended about 200 yards and the entire surface of the roadway saturated with the preparation. Farther out, the county commissioners have had about 1-8 mile treated in the same manner at county expense and will continue this into the city limits, so that there will be the better part of a mile of road thus prepared, which is subjected to heavy traffic. It will be closely watched during the summer. F. C. Battey, president of the Savannah Automobile Club, has been a moving spirit in having this work done, and has been successful in enlisting the interest of the county commissioners.

PITTSBURG CLUB PRIZES FOR ROAD REPAIRS.

PITTSBURG, May 12.—By way of encouraging road repairs, the Automobile Club of Pittsburg has offered gold money prizes, aggregating \$175, to the township road supervisors or committeemen who shall construct King split log drags and by their use accomplish the greatest improvement in selected stretches of the main traveled roads under their charge, preferably those connecting with the macadamized roads of Allegheny county. The drag named is a simple device for use on dirt roads, which has been in practical use for the past twelve years with splendid results.

ROAD CONSTRUCTION OUTSIDE DETROIT.

DETROIT, May 11.—With \$90,000 available this year as a result of taxation, and \$12,000 more coming from the State when the work outlined has been completed and accepted, good roads advocates in Detroit and Wayne county are in fine feather. The first bit of earth in what will eventually lead to a system of roads entirely covering the county was turned last week on Grand River avenue, a mile beyond the city limits, by the county highway commissioners, in the presence of State Highway Commissioner Horatio S. Earle and a large gathering of city and county officials and automobilists.

The ceremonies were of a practical nature, a heavy plough coupled to a massive steam engine being used to turn a deep furrow. From now on the work will be pushed with all possible speed, and it is hoped before next winter to have twelve miles of tar macadam road in commission on the principal thoroughfares leading out from the city. This will entitle the county to a reward of \$12,000 from the State, \$1,000 per mile being paid for macadam roads and \$500 for gravel when built in accordance with specifications furnished by the State. Next year it is planned to continue the work on an even more extensive scale, Commissioners Edward N. Hines, John S. Haggerty and William Murdoch having outlined an ambitious program.

Breaking Ground for Road Improvement Outside Detroit.

AUTOMOBILE CLUTCHES AND THEIR DESIGN*

By HENRY SOUTHER, MEMBER A. S. M. E. AND S. A. E.

CLUTCHES of one form or another, if one may judge from the literature on the subject, have been used since the earliest history of the mechanic arts, an important usage dating far back being in connection with wire drawing. It would seem, however, that clutches in general had attracted but little attention in the engineering world until recently, when they have been called upon to do the delicate work now required of them in connection with cotton mill machinery, printing presses, electric cranes, power plants, and, most recently, with automobiles. The positive jaw clutch is necessarily used only where the character of the starting action is immaterial, and if sudden,

Various Types of Positive or Jaw Clutches.

matters but little. It obviously can be used only where the inertia of the standing of driven parts is relatively small, otherwise materials could not stand the wear and tear. Modifications of the positive clutch are made in the angles of engagement between the jaws. The least positive form is one where the planes of engagement are inclined backward as regards the direction of motion at an angle of 15 degrees, more or less. The tendency of such a clutch under load is to disengage. It must be held up to its work by an axial pressure, which may be regulated to perform a normal duty, but to slip and disengage when called upon abnormally by some accident or overload.

Positive clutches with engaging planes parallel to the axis of rotation must be held up to their work to guard against a natural tendency to jar out, but they present no safety features against an overload. More extreme yet as to positiveness is the so-called undercut engagement of the jaw clutch, the tendency of which is to engage the tighter when loaded; and which can be disengaged only when absolutely free from load and in a condition to be rotated in a reverse direction sufficiently to overcome the undercut angle. In automobile construction the positive type of clutch is used inside the gear box, so arranged as to be operated only while the main friction clutch connecting the engine with the driven shaft is disengaged. This positive clutch sometimes takes the form in automobiles of an external spur gear meshing with an internal spur gear. Automobile gear changing systems are used that keep all gears in mesh all the time. Each gear carries a positive jaw clutch to be engaged with mates on the driving shaft, while the main friction clutch is temporarily held out of engagement.

Several inventors of merit have accomplished this same thing by a sliding spline, or a hardened ball, on the driven shaft, which engages with the gear hub internally. Such forms are in use, but it cannot be said in common use. It will be seen that this use of a positive clutch in connection with the automobile is one where there is little inertia to be overcome, the mass to be started being only a small shaft within the gear box and the gears on it. The chances are that even these are rotating to some extent in the direction in which they are to continue to move. After this positive clutch is once engaged the main friction clutch comes into play. No drag of the friction clutch is permissible.

*Paper read before the American Society of Mechanical Engineers at New York, May 12. Discussion to be continued at Detroit, June 25-28, in conjunction with the Society of Automobile Engineers.

The starting crank of an automobile is a first-rate illustration of an under-cut positive clutch. It is under-cut so that when the hand is applied to the starting crank there is little or no danger of the clutch slipping off and wrenching the operator. It is a fact, however, that some of these clutches are not under-cut and are disagreeable to handle for this reason.

Classification of Friction Clutches.

A rather careful search of the literature reveals the fact that there are basic types, few in number, involved in all clutches, but that there is an infinite variety of detail of construction and manipulation. Rankine differentiates between friction clutches about as follows:

- Friction clutch (contracting band).
- Friction cones.
- Frictional sector (invented by Bodmer).
- Friction disc (Weston's invention).

Reuleaux illustrates the Ramsbottom clutch as used for rolling mill work. This is nothing more nor less than a friction coupling in which one flange is squeezed between frictional surfaces by being tightly bolted. Referring to Fig. 5, the flange attached to part *A* is firmly clamped between the wood-lined surfaces of *B*, adjustment of the bolts being such that the friction will resist normal torque but yield to abnormal torque. This is perhaps the most simple form of friction clutch. It would seem as though some such device might well enter into the transmitting portions of an automobile, so adjusted as to resist up to, say, one-half the elastic limit of the parts involved, and slip under the application of any greater load. Right here it is well to point out, however, that many mechanical devices which have performed well elsewhere have performed badly in automobiles because of the unusually variable conditions to which an automobile is exposed, which might prove to be true of this clutch.

Reuleaux then shows as the next step in the development of the clutch a cone coupling, the two parts being forced into engagement by screw and handwheel *B*, as shown in Fig. 6. He states that the angle of the cone should not be less than 10

Fig. 5—Ramsbottom clutch.

Fig. 6—Cone clutch.

degrees, in order that the parts may not become wedged together. He also gives in connection with this clutch with frictional surfaces of iron on iron a coefficient of friction of 0.15. In order to keep the axial pressure within reasonable limits, he places the mean radius of the cone between three and six diameters of the shaft. Following the single cone clutch in Reuleaux is what might be called a multi-cone, as shown in section by Fig. 7, a series of concentric cone-shaped rings with angles of 10 degrees, or 20 degrees for both halves of the cone. As shown in this cut, it is apparent that the collar would have to resist the pressure and wear due to the axial pressure necessary for proper engagement. This would be serious.

Fig. 7—Multi-cone clutch.

Fig. 8—Weston clutch.

Such wear is avoided in heavy machine work or in high-speed automobile design by making the axial pressure self-contained on the rotating member, except when the clutch is in the act of being disengaged. Such construction as this has been found absolutely necessary in connection with all automobile clutches. This modification of the foregoing is shown in Fig. 9. The pressure of the screw wheel is self-contained, the two halves *A* and *B* being clamped together by it, the concentric double-faced cones furnishing much friction at slight axial pressure.

The next clutch shown by Reuleaux is that which he attributes to Koechlin, Fig. 10. This is of the internal expanding type, three internal clamp pieces, *A*, fitted with bronze shoes, being thrust out against the enclosing cylindrical drum *B*, by means of lever and screw action. Reuleaux points out the fact that there is no danger of wedging in this clutch, as exists in connection with the cone clutch. Reuleaux next shows a form of "axial friction coupling," well-known as the Weston clutch, based on the principle of multiple plate friction, Fig. 8. The plates are alternately wood and iron, as indicated, the wooden ones engaging with the outside cylindrical containing-case *A*, and the iron ones with the shaft, *B*. In the form shown, the plates are pressed together by springs, *D*, and released by drawing back a collar, *C*, which releases the spring pressure.

Some Machine Shop Clutches.

The foregoing reference to Reuleaux will serve to fix in mind the fundamental or basic types of clutches, and I will now give a number of illustrations to show the development of the machine shop clutch from the earlier forms already illustrated. Perhaps the simplest is the type in which one flat disc presses against another, the surfaces being leather against iron, bronze against iron, or wood against iron, the axial pressure being great enough to drive the maximum load, yet not so great but that slipping takes place when the load is first applied, which prevents all jar. Such clutches are familiar in the driving of looms.

In Fig. 11 is a modification of the Weston type. It is not multi-disc, there being only one wooden disc *A*, attached to the enclosing case *B*, which is gripped between two iron surfaces *C*, keyed to the driving shaft. To prevent any drag when disengaged, separating springs *D*, are supplied, which part the frictional surfaces when idle. Slight rubbing when idle is not a

very serious matter in machine shop clutches, however, but its importance in connection with automobile clutches I will bring out later. It is interesting to note that very little information is given or obtainable in regard to the frictional capacity of these machine shop clutches. Correspondence with the manufacturers reveals the fact that knowledge of the capacity of their clutches is of an empirical character. The coefficient of friction of maple (which is commonly used by them) on cast iron is known. Little use can be made of this knowledge, however, as the degree of lubrication, or lack of it, may easily double or halve this coefficient. The manufacturers have learned by experience what size clutch of their own make is necessary for the transmission of a given horsepower. Catalogues usually give the horsepower that can be transmitted at 100 r.p.m. It is probable that information of this kind, untechnical though it be, is decidedly more reliable than that obtained from any formula containing an unknown variable—the coefficient of friction.

What was formerly known as the Frisby clutch was designed many years ago when no attention was paid to mathematical design, but its capacity has been well established by experience. Fig. 12 shows this clutch, which is not unlike the last one described, except that a flat surface *A*, and cone *B*, are used in combination. The gripping of the surfaces is accomplished in very much the same way. The frictional surfaces are sepa-

Fig. 11—Modification of Weston type.

Fig. 12—Combined cone and flat surface.

rated by springs when disengaged. It is apparent that this clutch would require less axial pressure for any given horsepower transmitted than the foregoing type because of the cone; or, in other words, for a given axial pressure would transmit more horsepower, and, therefore, would be smaller and more compact, all other things being equal. But here again is the uncertainty of the coefficient of friction. This clutch, for example, might throw its oil to the frictional surfaces more than the previous example, which oil would more than offset the effect of the cone engagement.

Clutches of Small Dimensions.

A strong demand has developed for a clutch of very small dimensions for a given capacity. This demand has been met in rather a curious way. Instead of cast iron or metal of ordinary strength, hardened tool steel frictional parts have been resorted to. This permits exceedingly high normal pressures between the frictional surfaces. As much as 100-horsepower has been transmitted at 1,000 r.p.m. with a clutch containing friction rings 5 1-4 inches diameter and 1 1-2 inches wide. This form of clutch has been largely introduced into automatic machines, machine shop countershafts and launch engines. Its engagement is apparently soft enough for any of these purposes, but in connection with automobile service it is yet in the experimental stage.

Clutches with Cork Friction Surfaces.

In connection with the commercial clutches of the forms now under discussion, cork has recently entered the field to a considerable extent and apparently with considerable success. It has a high coefficient of friction, probably double that of wood

Fig. 9—Self-contained thrust.

Fig. 10—Expanding type.

The axial pressure in connection with such clutches is usually furnished by a spring disc; that is, the steel plate which carries the frictional surface, either leather or copper, is caused to operate like a diaphragm spring. The amount of normal surface pressure is not known in most cases as far as I have been able to learn. The above figures in this regard were furnished by the Cadillac Motor Car Company, of Detroit. The diameter of a clutch of this kind ordinarily used to propel a car of 7 horsepower or 8 horsepower is from 5 inches to 10 inches, the rubbing surfaces being about one-half to three-quarters of the entire superficial area of the disc. Such clutches are mostly available for two-speed cars, the disc clutch connecting with the engine direct and running at engine speed, the planetary system being used only for low speed and reverse work, actuated by contracting band clutches.

Motor vehicles so geared have their uses, but early in the development it was found that three or four speeds were desirable. Boxes of sliding or change gears were resorted to, and here the character of the clutch became of prime importance. To be satisfactory, an automobile clutch used in this manner must engage and disengage easily, requiring but small axial movement of the operating mechanism, or of the clutch itself. It must be entirely independent of centrifugal force, and able to slip for a reasonable length of time without being destroyed.

The matter of absolute disengagement is perhaps the most important. Without it the sliding gears intended to be operated when the clutch is free or disengaged cannot be unmeshed nor remeshed. The slightest drag or friction in the clutch means a savage clashing of gears when changed. This means the destruction of the gears and the failure of the entire system of gear change. The early history of the art is full of failures in the matter of successful construction and operation of the so-called sliding-gear transmission. Gears with the teeth worn away were the rule rather than the exception. This wearing was, no doubt, due to the imperfect disengagement of the clutch. The use of a system of gear change requiring the clashing of moving gears cannot receive the complete approval of the engineering world; yet this system has become a success by a combination of improvements in clutch and materials of which the gears are made, and treatment of the materials.

An important feature in the clutch is the question of its weight, especially as affecting its inertia. A clutch having high flywheel effect spins to such an extent as to cause violent clashing of idle gears. Consequently, clutches are made as light as possible, and the smaller in diameter the better. Aluminum enters largely into clutch construction for this reason. The spinning of the clutch has been met in many automobiles by a so-called clutch brake—a retarding finger which operates in connection with the clutch disengaging lever and bears upon some portion of the driven member of the clutch, braking it to a standstill.

One inventor has gone still further in this direction and disengages the driven shaft both before and behind the gear box. This invention is such that the friction clutch opens first, immediately followed by the opening of a positive jaw clutch behind the gears and then braking of this disconnected driving shaft, as just described. This permits the engagement of gears that are absolutely free and stationary. It may be well to bring out the fact, however, that this invention is open to one objection, and that is that the gears may stop in such a position as to make it difficult to mesh them.

Any automobile clutch must engage smoothly and absolutely without shock to be called a success. The quicker it seizes without shock the better it is. Clutches exist that can be engaged suddenly and still not jar the passengers. But such a clutch is open to one very serious objection; that of not picking up the load quickly enough on a hill to start the car forward after a change of gears, before the momentum of the car is materially lessened. For example, in changing from the high gear to the next lower on a steep hill, a clutch that is too soft will permit the speed and momentum of the car to drop to such an extent that when the clutch finally does take hold the car is nearly at

a standstill. This necessitates a further drop into a lower gear; one that will start a car from a standstill on a hill. The clutch designer is, therefore, between two fires; too little slip on one hand and too much slip on the other. A degree of slip between the two must be found, and once found be capable of being maintained. It is doubtful if such a problem exists in connection with clutches anywhere else in the mechanical art.

The customary location for an automobile clutch is within the flywheel or at least at the rear end of the engine, if the flywheel is at the front end.

The application of the multiple disc type takes very little room between the gear box and the clutch, and would be too close construction (as will be shown later) for the application of the cone type of clutch, which requires so much flexibility back of the clutch.

Details of the Cone Clutch.

I will take up the simplest form first, namely, the cone. I am pretty well satisfied, that, all things considered, it is the best form when properly designed and mounted. It has the advantage of engaging and disengaging with very small axial motion. Axial pressure may be low because the normal pressure between frictional surfaces is multiplied by the angularity of the cone. Its weight may be very small, as the male member may be of aluminum. Its engagement is entirely independent of speed and centrifugal force. No liquid lubricant is needed with attending viscosity, drag and change due to wear and temperature. Disengagement may, therefore, be made perfect.

Proper engagement, however, has proven to be a very difficult and baffling problem. I think it safe to say that this difficulty has caused nearly all the rejections that have occurred of the cone clutch. A cone clutch may operate almost as savagely as a positive jaw clutch. It may also refuse to engage, if it does not have the proper combination of angularity, pressure and lubrication. It may behave well at times and very badly at other times. A cone clutch of given angles and dimensions, with a definite axial pressure, may be a success in one car and an absolute failure in another.

The cause of this contradictory behavior may not be and often is not in the clutch proper; but, on the contrary, in the surrounding mechanism of the clutch. The cone clutch must be absolutely free to center itself and seat itself uniformly. A short Oldham coupling or a single universal joint between the clutch and the driven shaft of the car is not enough to permit this under all conditions. The weaving of the frame of the car puts cross strains on such a coupling, causing it to bind and causing the clutch to seize on one side before the other and be drawn suddenly into full contact. A change of angle, increased lubrication and a change of materials on the friction surface will not remove the trouble arising from this cause. A pair of generous, free working universal joints must be provided, in order that the cone shall reach its seat as intended.

Similarly, an engine mounted on a flexible sub-frame or pan support may move sufficiently to prevent the proper seating of the cone and cause a similar line of troubles. The male member must be mounted so as to be flexible enough to follow such small movements. Experience has been a long time in teaching engineers that so much trouble can arise from apparently so small a cause; yet there are cases where misbehaving clutches have become well-nigh perfect by the introduction of flexible couplings.

Leather (riveted onto an aluminum cone) usually forms one of the rubbing surfaces and gray cast iron the other. It is desirable that the leather shall be kept soft by neatsfoot or castor oil. Some builders boil the leather in tallow before applying to the clutch surface; others do not, but this matter is of minor importance compared with the mounting. With leather 1-4-inch to 3-8-inch thick, properly softened, engagement may be sufficiently mild, but an improvement is obtained by placing under the leather at six or eight points on the periphery of the cone flat or spiral springs that cause the leather to engage at these points a little bit before engaging elsewhere.

(To be continued next week)

LETTERS INTERESTING AND INSTRUCTIVE

EXCESSIVE CURRENT CONSUMPTION CAUSES.

Editor THE AUTOMOBILE:

[1,351.]—In "Letters Instructive and Interesting" of the issue of the 30th, we note No. 1,335 letter regarding a coil vibrating when the spark plug is disconnected from the engine. Now we have just purchased a new Buick, and we find that the secondary wire can be disconnected from the plug on one engine and the coil buzzes just the same. Now from your answer to No. 1,335 we cannot take that our coil is working right. If our coil is short-circuited, would it cause our batteries to run down more rapidly than otherwise? That seems to be our main trouble. A new 60 ampere hour storage battery and 5 new dry cells only run the machine about 600 miles. Would you advise an Elsemann magneto for a two-cylinder car?
Ravenna, O. G. W. CURTISS.

Our answer to Subscriber, Fair Haven, Vt., in this issue serves to reply to the first part of your letter. The coil should vibrate whenever a current is sent through its primary winding, but it should not vibrate simply because the spark plug is removed. In other words, the operation of disconnecting the plug should not cause it to vibrate independent of other causes. But the mere fact that the coil vibrates with the plug disconnected does not show anything one way or the other. If the coil were short-circuited, it would not work at all, and the batteries would be run down in a very short space of time, probably not more than half an hour. Either dry cells or accumulators should run your car 1,500 to 2,000 miles or more, without becoming exhausted. In all probability you will find that the coil vibrators are so poorly adjusted that they are taking an excessive amount of current. To remedy this, test them with a coil current tester, or low-reading pocket ammeter, which has a scale reading from zero to 3 or 5 amperes by tenths.

Disconnect the battery from the coil to be tested, and connect this wire to one of the terminals of the instrument; connect the other terminal of the meter to the coil where the battery wire was taken away, thus inserting the ammeter in the primary circuit. The engine should then be run and the adjusting screw of the coil vibrator turned up or down, until the engine will run steadily on a current consumption not exceeding .50 to .75 ampere. The needle will flutter constantly, but its range of movement is not sufficiently great to interfere with effecting the adjustment. Do the same thing with the other coil. If you will adjust both coils not to take more than .75 ampere, you will find that the batteries last twice as long. Take a look at the timer also, to see if there is anything wrong with it. An Elsemann magneto is an equally valuable investment on a two-cylinder car as it is on any other, but it is not so much of a necessity owing to the fact that the two-cylinder car of the four-cycle type only fires once per revolution, as compared with multi-cylinder motors.

EXPERIENCE WITH INTERNAL TIRE PROTECTORS.

Editor THE AUTOMOBILE:

[1,352.]—Being a subscriber, I would like to know your experience, if any, with internal tire protectors, a series of steel discs laid in a band of canvas, and set between the tube and the shoe. If you have no personal experience of which you can advise me, I would appreciate it to know what faults, if any, have come to your knowledge regarding these protectors. E. EISEMANN.
New York.

We have never had any experience with devices of the type you mention, nor have we ever heard of the particular one that you speak of having developed any faults, which means, in short, that we have not heard anything concerning it in actual use. The idea looks attractive at first sight, but whether it is practical or not has to be determined by experience. If any of our readers have used these internal tire protectors we should be glad to hear from them, publishing their experience in these columns.

MORE ABOUT COIL VIBRATOR DIFFICULTY.

Editor THE AUTOMOBILE:

[1,353.]—I note in your answers to letters No. 1,311 and No. 1,335, that you state the coil should not vibrate when the wire is disconnected from the spark plug. Now I have tried this on a number of types of motors and the coil always vibrates when contact is made at the timer, whether the spark plug is connected or not, other connections being all right. Now, why should not the coil vibrate? I think your answer is misleading, as you perhaps misunderstand No. 1,311's letter. A SUBSCRIBER.

Fair Haven, Vt.

Upon rereading letter No. 1,311, in the light of your communication, we can see where the answer thereto is misleading to a certain extent. In stating that the coil should not vibrate when the plug was disconnected we did not intend to imply that this should not be the case simply because the plug was not connected up, but that the operation of disconnecting the plug should not cause the coil to vibrate. As the vibration of the coil trembler is caused by the current passing through the primary coil and energizing its core, thus attracting the vibrator armature, the latter interrupting the current by its movement, this operation is entirely independent of the spark plugs, or, for that matter, of the secondary winding of the coil, and if the coil will not vibrate when contact is made at the timer it is naturally to be inferred that there is something wrong with the battery or the connections. The closing statement of the answer in question, that "the coil should only vibrate when contact is made at the timer, as intended," should cover this point.

ATTEMPTING TO DEFINE THE STOCK CAR.

Editor THE AUTOMOBILE:

[1,354.]—The Automobile Club of Wilmington is planning to hold a road race for stripped stock cars, and I would thank you very much if you will answer the following questions through your "Letters Interesting and Instructive," so that we may get some definite ideas as to what constitutes a stock car.

1. Is it permissible to change the gear ratio from that supplied on the car when delivered from the factory?
2. Is it permissible to increase the size of the rear wheels so as to increase the speed of the car without increasing the gear ratio?
3. Is it permissible to remove the entire body and substitute instead a body of different type?
4. Is it permissible to remove the gasoline tank and substitute a smaller one, so as to take up less space?
5. Is it permissible to substitute flatter and lighter springs so as to bring the center of gravity nearer the ground?
6. Is it permissible to attach a tire pump to the gasoline tank so as to pump air into said tank to cause the gasoline to more readily flow to the carbureter, if this car when shipped from the factory is supplied only with a gravity feed?
7. Is it permissible to increase the compression of the motor by placing plates either on the top of the pistons or in the top of the compression chamber?
8. Is it permissible to install a type of carbureter different from that originally supplied by the manufacturer?
9. Is it permissible to install a magneto on a car not equipped with one by the manufacturer?
10. Is it permissible to remove fenders, mudguards, running boards, dustpans and mufflers? If it be permissible to remove fenders, is it permissible to install instead fenders of lighter construction?

Our rules as drawn up merely provide that all entries shall be stripped stock runabouts listing for \$900 or less, as equipped by the manufacturer. BURKE H. BRIDGEIS.

Wilmington, N. C.

1. This is commonly done, but we do not think it should be allowable, as, if the car is geared especially for racing, as is the case where the change is permitted, it is no longer a stock car.

2. The answer to question No. 1 would apply to this equally. Taking the meaning of the phrase "stock car" in its every-day significance, it is evident that such changes would not be allowable, as it would not be possible to go

to the manufacturer's plant and pick out a car with an unusually high gear or unusually large wheels. They would be the same on the whole series of cars of that model being turned out, and altering them in such important essentials would be radical changes made solely for the purpose of gaining extra speed.

3. Yes. The usual racing seats are generally allowed. This does not change the chassis in any particular, and this, after all, is the "car."

4. Changes in the gasoline tank are also permissible, a larger one generally being employed.

5. This is another alteration that would take the entrant out of the stock car class, as with special springs it would not conform to the requirement that the maker should have built a certain number of duplicates of the car entered.

6. Special arrangements for feeding fuel and lubricating oil are usually permitted, as they are usually necessary to sustain high speed for any length of time.

7. Naturally not. Nothing could be further from the definition of a stock car than one which had been tinkered with in this manner. The product of such expedients would be something that was neither a racing car nor a stock chassis.

8. Interpreting the requirements strictly, this would not be permissible.

9. The answer to the preceding query would also cover this, but in view of the fact that both carbureters and magnetos are purely accessories, and, in the case of low-priced cars, seldom, if ever, built by the maker of the car, it would not be necessary to stretch the rules very much to make substitution of either of these essentials permissible.

10. As such races are always for "stripped" stock cars, this naturally permits of the removal of such superfluous parts as fenders, and it is equally allowable to substitute others of a lighter nature, such as strips of cloth. Racing rules for such cars sometimes permit the removal of mufflers, and in other cases merely allows them to be cut out, but not removed. Their removal, however, would appear to be a legitimate part of the stripping process.

The statement following your queries concerning the definition of a stock car, and which ends "as equipped by the manufacturer," would appear to us to put an effective quietus on any attempt to change gear ratios, wheels, carbureters, install a magneto or undertake any of the numerous expedients that you have mentioned, as any one of them would be digressing this very important part of your rules. It seems to us it should not be difficult for you to settle the question, as any low-priced car is a stock car pure and simple, in the shape that its owner purchases it. Removing fenders and the like and putting on special racing seats makes it a stripped stock car. What more is there to it?

GOOD SUGGESTIONS FOR FORD OWNERS.

Editor THE AUTOMOBILE:

[1,355].—I was much interested in letter No. 1,324, by Charles Gilbert, explaining changes which he had made in the gasoline pipes on his Ford runabout. Once or twice last summer I had similar trouble, although did not find out at the time what was the cause. I wrote the Ford Company, who advised me that the location of the gasoline connection was too close to the exhaust and should be changed, as they have been doing for quite some time, in their later cars. On reading the above letter, I at once saw a simple way of accomplishing this, and for the benefit of others will explain just what I did. I obtained from a plumber's supply shop a 1-2 inch diameter by 11-2 inch nipple, a second one 1-2 inch by 4 inches, and two elbows to fit. I found these dimensions correct, so that the location of the parts was exactly in the right place when reassembled. I attach herewith sketch showing this arrangement, and would suggest that each owner of the Ford cars which have the hole in the gasoline tank almost directly over the exhaust pipe, should make this change. This will remedy a great majority of their so-called "carbureter" troubles. The cost of these four parts is about 50 cents. Be sure to get them of brass, however.

A very tantalizing trouble which I have had recently and how I overcame it might also be of interest. Very frequently No. 3 cylin-

der would fail to explode, and the trouble seemed but slightly remedied after putting in new primary wires. I then thought that perhaps the trouble might be in the commutator, and while it appeared clean, I nevertheless put a little piece of emery cloth on a little stick and polished the No. 3 contact point in the commutator, then thoroughly washed all dust and dirt out with gasoline, and have not had a misfire since.

I hope that some of your readers may be benefited by the above suggestion.

W. S. HAGAMAN.

Sharon Hill, Pa.

The manner in which you diagnosed the difficulty and overcame it is not alone very interesting, but should prove valuable to numerous owners of similar cars. We have noted the sketch showing the change, but as it is practically the same as that submitted by Mr. Gilbert have not reproduced it.

WORTH FIFTY TIMES A YEAR'S SUBSCRIPTION.

Editor THE AUTOMOBILE:

[1,356].—Through your "Letters Interesting and Instructive" I have gained more general knowledge of details of the ordinary automobile engine than can be gotten for fifty times the cost of your paper, but there is a question that has not been answered, to my satisfaction at least. Will it be wise or unwise practice to use a paste of cylinder oil (good grade) and graphite, half and half, to lubricate and reduce noise in a selective sliding gear transmission and roller bearing differential assembly? Desire to thicken lubricant to prevent throwing out at bearings and brake hubs respectively.

W. H. GERHARD.

Austin, Texas.

This practice is highly recommended by some authorities and at least one manufacturer turns out a special compound consisting of graphite and wood chips or shavings especially intended for use in change speed gears. You will find an inquiry concerning this subject in the issue of THE AUTOMOBILE of April 23, page 569, Letter 1,321, together with the answer thereto, and we are since in receipt of a letter which is published in last week's issue of THE AUTOMOBILE, stating that the writer had tried various forms of sawdust without satisfaction and had found that cork filings and oil gave the best service.

COMPOUND FOR FILLING PNEUMATIC TIRES.

Editor THE AUTOMOBILE:

[1,357].—Will you please give me, through "Letters Interesting and Instructive," a formula for some good compound to fill tires with?

A SUBSCRIBER.

Portsmouth, O.

We do not know a good formula for this purpose and consequently hesitate to give you any. Common sheet glue and molasses in the proportion of one pound of the former to three pints of molasses will make a puncture-proof filling, but it will not be all that is desired by any means. Any good formula of this kind is naturally a trade secret and is likewise beyond the reach of the amateur to duplicate successfully, as it is necessary to put it into the tires under considerable pressure, requiring special machinery. Once a tire that has been treated in this manner shows signs of failing, the only thing to do with it is to throw it away, as it cannot be repaired and is of no further use.

REPAIRING A LEAKY HONEYCOMB RADIATOR.

Editor THE AUTOMOBILE:

[1,358].—Will you please favor me with directions for repairing a leak in my radiator? The leak is a slight one in a "honeycomb" type radiator, and I believe that it is possible sometimes to repair such a leak without taking down the radiator and soldering it. If a repair can be affected by running some solution through the water system, I am sure that any information that you can give on the subject will be of great benefit to others as well as to myself.

Pasadena, Cal.

J. H. STONE.

There is no way of repairing such a radiator, or any other type for that matter, by merely injecting something into the cooling water. At least we do not know of any. We should advise taking the radiator down and having it soldered by a good mechanic, as a bungler with a soldering iron will do more damage in ten minutes than can be repaired in half a day. It is a delicate job and requires a good hand.

ARE SPECIAL STEELS ONLY A FAD?

Editor THE AUTOMOBILE:

[1,359.]—During the past two or three months there has been appearing in the daily press a certain abort article which recurred with some frequency in different papers, with an occasional change of wording, and which conveyed in substance the impression that "special steels" are of no special value in automobile construction, except perhaps here and there, for the purpose of reducing the weight of a part. The note has usually been coupled with the name of Hayden Eames, and with the output of certain automobile factories, and the "special steel" has been contrasted with ".50 carbon" steel as a material supposed to afford all the strength required. Finally this same item appeared a few days ago in two New York dailies, and, as it deals with a subject of enduring interest to the public, as well as to automobile manufacturers and to the whole independent section of the steel-making industry, I wish you would kindly allow me space for some remarks intended to present this subject in a more correct light.

From the standpoint of economy, a good deal may be said in favor of simple, ordinary carbon steel, so long as the carbon content does not exceed about 15 "points," meaning 15/100 of 1 per cent. Such steels may be handled successfully by the average workman. They may be successfully surface-hardened for gears, and the danger of overheating them in forging is not great. But, with higher carbon content the case is different. A 50-point carbon steel is difficult to forge, easily spoiled by overheating, and when used for gears, either too brittle or not hard enough. Its "life," or durability under shock and alternating stresses, is short, or at least precarious, and it is, in fact, the principal mission of "special steels" or alloy steels, as they are more commonly known, to obviate just those difficulties encountered when increased strength is sought through increased carbon content in ordinary steel. The most valuable alloy components are not only hardeners, as carbon is, but also tougheners, which carbon is not.

Mistakes have been made, to be sure, in alloy steels, especially by having their carbon content too high, but it is easily possible at the present stage of progress in alloy steel manufacture to select alloy steels which possess greater strength than 50-point carbon steel, and which couple with this greater strength, greater toughness than is possessed by any ordinary steel, and also perfect suitability for surface-hardening and much increased life under the shocks to which all automobiles are subject.

The principal error which has been committed so far with regard to special alloy steels has consisted in failure to draw a sharp line between the safe, low-carbon, alloy steels, on one side, with their moderate but distinct all-around superiority over ordinary low-carbon steel, and the more ultra alloy steels which promise superlative possibilities for special purposes, if made just right and worked just right, but in which the dangers of any high-carbon steel for construction purposes are accentuated. This division line among alloy steels is only the same which experience in other industries has drawn between ordinary low and high-carbon steels.

Alloy steels have had a vogue, it is true; and some have suffered by following the vogue rather than the sense behind it. Now the pendulum is swinging back, and the time may seem favorable for pronouncing 50-point carbon steel good enough, since it is economical to the manufacturer by its relatively low price, and economy is a perfectly legitimate consideration. But it proved a failure in bicycles; it has been definitely rejected as construction material for racing cars and in ball bearings, and for every other application in which the presence or absence of the properties required for continued resistance to shock is subject to rapid and conclusive demonstration. It makes good shovels and good ploughshares, but in automobiles it is less economical to the owner than to the maker, although it should perhaps be admitted that a capable designer may steer a moderately safe course, commercially speaking, between too much weight, on one side, and too short life, on the other, and yet use nothing but ordinary carbon steel.

In order to produce the greatest value, however, it is the low-carbon alloy steel which affords the most suitable, and, in the long run, the most economical construction material from which to build automobiles for severe service, just as it has already been abundantly proved to be the highly specialized alloy steel of high carbon, which affords the most economical material for tools for all purposes requiring hard work and long life. There is still left a large field for simple low-carbon steel in the construction of cheap automobiles intended only for very light work and low speed. But the field for simple high-carbon steel lies in other spheres with which the purchaser of automobiles, as such, has little to do.

While convinced that a clipping bureau or advertising agency, rather than Mr. Eames, is responsible for the press notices which have been so widely copied and in which simple high-carbon steel is recommended as construction material for automobiles, I would suggest that a public discussion of the subject would be timely, and to this end I propose the following theses:

1. There are alloy steels, of 10 to 30-point carbon, offering very nearly the same facilities for forge work and surface-hardening as ordinary steels of same carbon contents.

2. These alloy steels, referred to under 1, are not only superior to ordinary low-carbon steel in strength and durability, but are proven stronger than ordinary 50-point carbon steel by all static tests, and much tougher and more durable than ordinary 50-point carbon steel by all dynamic and shock tests.

3. The only point of superiority of simple 50-point carbon steel (whether basic open hearth, acid open hearth or crucible) over the low-carbon alloy steels referred to, lies in its lower price.

4. Alloy steels should not be used to reduce the weight, but to increase the durability of automobiles.

New York City.

MARIUS C. KRARUP.

AN EFFECTIVE WAY OF LOCKING A CAR.

Editor THE AUTOMOBILE:

[1,360.]—There are many reports from various cities of automobiles being stolen while standing unattended, particularly in the evening; and it struck me that there should be some simple method of locking a machine, beyond the general custom of taking away the switch key. I worked out a little device on my own machine and which I offer to your readers for what it is worth.

My clutch pedal when thrown out comes to within about six inches of the dashboard. I have therefore attached to the dash where it joins the floor a good solid plate staple through which I run a chain around the clutch pedal, bringing the two ends of the chain together and lock them with a brass padlock, and with this device attached and my emergency brake on I defy anyone to make off with my car. The device is so simple and the total cost runs under \$1.50, so that it seems to me a pretty good "insurance."

Detroit, Mich.

S. C. STEARNS.

COOL RUNNING WITH THE FAN BELT OFF.

Editor THE AUTOMOBILE:

[1,361.]—Some time ago I had occasion to go to a house a few miles out in the country. When I arrived I noticed the water boiling furiously in the radiator. On looking inside, I found the belt which drives the fan had broken and was lost on the roadside somewhere. As the weather was clear, the roads not dusty, I took off the hood entirely and ran home without the use of the fan. The water never boiled and the engine as cool as ever. This may be a trifling item to report and it may have been done hundreds of times before, but it is often these little almost self-evident things which we forget to mention.

Richmond, Va.

M. D. HOGE, JR., M.D.

EXPLAINING THE MAXWELL OWNER'S TROUBLE.

Editor THE AUTOMOBILE:

[1,362.]—In reply to letter No. 1,320, would say the Maxwell oiler is of the compression type. After the car is stopped the oil will feed as long as there is compression left in the crankcase. As the pistons generally stop farthest from compression and the rings become worn, quite a quantity of oil will find its way into the firing chamber. And this makes the motor start irregularly and smoke until the cylinder can clear itself through the exhaust. Try loosening the screw cap at the top of oiler when you stop the car.

Hightstown, N. J.

R. W. NORTON.

HELP FROM A SOUTHERNER FOR MR. RADWAY.

Editor THE AUTOMOBILE:

[1,363.]—In reply to Charles J. Radway, in your issue of April 23, letter No. 1,320, would say he will find his trouble in the valve seat on the stem of his float, either from a sprung stem or a bad seat. When the motor is stopped, it lets too much gasoline in the carbureter. If he will see that the float valve shuts off all right his motor will start and not miss with the spark retarded.

Greenville, S. C.

FRED H. COOPER.

HOW THE INQUIRER MAY REMEDY TROUBLE.

Editor THE AUTOMOBILE:

[1,364.]—Seeing in "The Automobile," issue of April 23, a Maxwell touring car owner having trouble when starting, will say that a Schebler carbureter will fix this, and if this does not, a new exhaust valve spring will. He will also find a stiff wire brush (sold by the Maxwell people), to clean his cylinders out, a great help. This fixed our Maxwells.

Berthoud, Col.

BERTHOUD AUTO COMPANY.

SUGGESTIONS FOR A PUZZLED AUTOIST.

Editor THE AUTOMOBILE:

[1,365.]—In answer to letter No. 1,320, in your issue of April 23, I have a Maxwell two-cylinder touring car and experienced much the same trouble. Think he will find the cam and contact blocks of his commutator worn, or the spring weak. It would be well for him to examine them.

Carroll, Ia.

E. N. MERCHANT.

FARMER, ACCUSTOMED TO MACHINERY, CAN "USE" AUTO

FROM THE NATIONAL GRANGE OFFICIAL ORGAN PATRONS OF HUSBANDRY—N. J. BACHELDER, EDITOR-IN-CHIEF.

A FEW years ago a very strong feeling prevailed in the rural districts against the automobile. This was due to the fact that farm horses were not accustomed to the so-called "go-devils," and accidents were by no means uncommon. For a time there was an effort to create a sentiment against the automobile so as to legislate it out of existence, but that feeling has almost entirely passed away. Concessions made on the part of automobile owners and the exercise of a greater degree of tolerance on the part of farmers have amicably solved the whole difficulty, the result being that the automobile among all classes is more popular to-day than ever. With the increase in the number of machines used driving horses have become more accustomed to them and accidents to-day are few and far between.

We are acquainted with a few farmers who own an automobile, and we find that these machines are more highly prized by those who make use of them on the farm than they are by the city man. As the farmer is accustomed to handle machinery, he is able to "use" and not "abuse" his machine, and as he is his own machinist, he keeps it from getting out of "kilter" by always having it in the best of running order. He knows that

it is not the wear and tear during use that is hard on farm machinery, but the lack of care, and, fortified by this knowledge, he can get much greater service out of an automobile than can the average man who possesses no ability as a mechanic.

Horse feed in these times comes high, and the horse eats whether he works or not; the automobile, while it is standing still, costs nothing to maintain. A twenty or twenty-five-mile journey is a day's work for the average team, while with the automobile this distance is covered in about an hour. As the King road drag comes into more general use, the automobile will increase in popularity, in our opinion, because it satisfies a real need on the farm. It is not necessary for us to enumerate the uses to which it can be put, as each farmer knows full well how often he can use a good driving horse or a good team if these are available, and when you consider that the time of a horse can be cut in two, and even better than that, the conclusion must be reached that the automobile will be of the greatest service to humanity when it becomes the distance annihilator for the farmer, as it now is for the large body of automobilists who recognize its value for getting over the ground quickly.

PHYSICIANS TELL OF THEIR GREAT USE OF AUTOMOBILES

AS a class, the automobile has no more consistent and more loyal set of users than the medical fraternity. First and foremost, the doctor invests in an automobile for business use; it will take him where he wants to go—where he is needed, often very urgently—in a fraction of the time any other method of transportation at his command can possibly do. It will take him long distances in a very short time, and robs the country practise of much of the hardship attendant upon long drives in bad weather and at all hours of the night. It is no less valuable or less useful to the medico whose practise lies within the confines of a city. So that it is scarcely to be wondered at that doctors comprise a very large portion of the total number of auto users. Likewise, doctors form a very substantial fraction of the buyers of Rambler cars, and, on this account, Thomas B. Jeffery & Company, Kenosha, Wis., have made the May issue of the *Rambler Magazine* a special physicians' number.

It is a thirty-six-page booklet, gotten up in an attractive typographical dress, and is replete with attractive photographs of the doctors and their Ramblers all over the country. It is not alone one of the most pretentious efforts of the kind ever produced by the publicity department of any automobile manufacturer, but it is also the biggest thing of its order ever attempted, as an edition of no less than 50,000 copies has been printed, so that one will be placed in the hands of every doctor from Maine to California. In addition to the very numerous photographs of doctors and their machines, which serve to illustrate this special issue of the *Rambler Magazine*, there are a number of interesting articles contributed by physicians, showing how the ownership of an automobile is something without which the modern doctor is badly handicapped.

But it is not all business by any means, for the doctors, as well as other people who buy cars, do so for the double purpose of getting round where they are wanted and of giving enjoyment to their families of a nature that only the automobile can provide. So the wielders of the knife and the administrators of pills and lotions are also shown in their hours of ease, toward which their cars contribute so greatly, as well as on duty bent. Nor are they all Ramblers of the latest vintage that the makers have pictured in the pages of this unusually attractive issue of the magazine, as some of them date back to the earliest days. For instance: "I have worked my car hard since 1903," says

Dr. R. M. Tafel, of Phoenix, Ariz., "and feel as kindly toward it as I do to the family horse. I bought my car for work, and not for pleasure, and am glad to say that the repairs on it have been trifling."

"Four years without repairs," says Dr. J. C. Carson, of Valparaiso, Ind. "My practise has grown greatly since I got it, and after having made 15,000 miles, my first Rambler was sold on its reputation for only \$300 less than what it cost originally." This is the general tenor of the experiences outlined in the magazine, though some go into detail to a greater extent, showing that even without considering the vastly greater service rendered, the automobile is a better investment for the doctor than a horse.

Says Dr. A. H. Robinson, of Kenosha, Wis., on this point: "Two years' experience with a Rambler in my practise, after eighteen years' experience with a horse, has convinced me that I can do double the amount of work with an automobile and yet have more time for recreation." This, in fact, sounds the keynote of the value of the automobile to the physician, as it prevents him from being bound down to his work for eighteen to twenty hours a day. Continuing, Dr. Robinson says: "After eighteen years' of faithful service, I do not wish my old horse to fall into unkind hands, but if he were to die I would never buy another, but would use two automobiles. I have never had an accident with the Rambler, and have never been towed in, and the car has always gone on its own power, although the first thing I did with my car was to make a 2,000-mile trip. I expect it to run as well for two seasons more."

Doubtless the class of information that physicians who are intending purchasers of automobiles are most anxious to gain is that concerning the actual cost of keeping and running a car. This subject is pretty well covered, as may be seen from the following taken from the contribution of Dr. Alexander Nettelroth, Louisville, Ky: "I have calculated my mileage from figures based on the first 5,280 miles (then the odometer was broken and not replaced). I used 241 gallons of gasoline; this gives an average of 22 miles to the gallon, and has since been verified over known distances and is accurate; hence, I can fairly estimate my mileage on a total of 800 gallons consumed to the first of this year as about 17,600, which cost me \$746.73 over a period of five years. An accident contributed a heavy repair item to this bill, there being no expense for repairs in the fifth year."

A STUDY OF THE MICHIGAN FACTORY SYSTEMS

By BERNE NADALL.

DETROIT, May 11.—With an ample equipment of modern machine tools, a good many of them of special design, 2,000 skilled mechanics, housed in a spacious, well-ventilated and light factory of hygienic construction, and an organization of unusual merit, the Packard company of Detroit stands foremost as one of America's leading scientific institutions. Everybody knows the Packard car, so we will deal mostly with the concern that makes it.

To know of the workings of the organization is to gain knowledge as to how well the work is done. The first impression of the plant was gained by the handsome entrance and a stroll through the spacious hall which leads to the various offices. The arrangement of these is in itself a study, as each office has outside light. This scheme is applied throughout the works and naturally all hands are working under the best conditions at all times, both socially and hygienically. An illustration of the correspondence room shows a busy force employed. No office

tracings are cared for in the same manner that the banker safeguards his money and the most precious of his documents. They are as carefully guarded against loss by theft or fire as the most valuable papers possibly could be, and a most complete record is kept of every one, showing exactly where it can be found without a moment's delay.

Going into the factory one finds a clean shop. By clean is meant such cleanliness as one would find in an office. The whole institution is one of newness and comfort—even the wood working department is free from dust or grime, and also that awful clatter which usually attends a visit to a wood-working plant. It is impossible to show a view of this and several other departments, for some of them never have been photographed. It would be well worth showing the wood-working department as an example of what can be done in a factory by way of benefiting the conditions of the men. The new engine house also is incomplete, but of equally fine proportions.

A Glimpse of One Corner of the Completely Equipped Testing Room of the Packard Plant.

contains a stenographer and no typewriter mars the quietude of the various official sanctums, which is an innovation that must be tried to be appreciated. No better summing up of the situation can be made than is illustrated by this trend, shown all through the institution—the minute study of every part and every condition. In an illustration of the physical laboratory, which is in line with the row of offices, but just as quiet a place to be in, it will be observed that a spring is shown undergoing a test. No part of the Packard car leaves the works without first passing some official inspection; by that is meant that every part must be recorded and hall-marked by the proper official, who does nothing else.

Next to this department is the chemical laboratory, where experts are continually analyzing the ingredients which go to make up the metal formulas, or to test such products as the company might purchase from other concerns or countries, as no new invention which is of interest to the motoring world is ever turned down by the company without at least an investigation as to its merits. The draughting department is as large as the stenographic staff; in fact the photograph herewith shows only about one-half the staff at work. Original drawings and

Of the many departments which go to make up this huge concern, the visitor is impressed by the scrap department, which occupies the large space of 5 square feet. It was with pride that the guide showed the scrap pile. One would think, because of the great amount of testing going on, that a big scrap pile would accumulate, but it is said to be quite the reverse. The fact that everything must pass a certain test makes the men exceedingly careful, and by keeping each man up to the mark he makes a better workman; in fact he always is improving rather than retrograding. This goes to show that quality need not necessarily mean waste.

On and on through the spacious buildings we went—a never-ending, instructive trip. At one point incomplete engines galore were found, running with dummy cylinders; at another the engines were running under their own power. A continuous chain of systematic shifting always was taking place as the work progressed, and not one moment was lost in the operation. It was particularly interesting to note the manner of checking the work as it went through the factory. A tally card is attached to every job that goes through. These cards are numbered and recorded and at any time one can trace where the job is. By

The Packard Visitors' Reception Room.

the time the card leaves the machine shop it has a whole motor car attached to it, but even then its course is a long way from the end. Each department through which it goes records the work done and also checks off by punch mark every article that has been supplied to it by the other departments.

Where and How the Rapid Is Built.

A visit to Pontiac, Mich., takes one to another concern which has made an exhaustive study of system in the shop. The Rapid truck is well known in many countries. Up to the present time no fewer than sixteen countries are using these commercial and sight-seeing cars, and the business is increasing all the time. Much of the success of this company is due to the manner in which the business is handled, both commercially and in the factory. It is not altogether plain to the outsider that it is more essential to have a good working system in the factory where commercial rigs are manufactured than in the pleasure car shop, but a little reflection brings to one's mind that a few days' delay in the delivery of a car or even a part in the case of the pleasure vehicle may not matter, but a 24-hour delay in the delivery of a part for a commercial truck will cause a running fire of complaint. Let one truck doing duty for a concern cease working for a day only and the condemnation knows no end; hence the manufacturer who wishes to keep in business must have his institution running in chain fashion all the time. The

Part of the Packard Well Lighted Draughting Room.

Rapid people seem to have mastered the case well, and it is the only place visited where two store rooms are utilized to keep abreast of the wants of both the factory and the user. Every want received by mail or wire is on its way to the customer within an hour's time after the receipt of the requisition. The same painstaking care exists throughout the shop, and such allotments for work going through as may be required are anticipated by records of the progress of the work, and the material is found in readiness, waiting for the order of the shop foreman.

This system of working not only saves delay in supplying wants rapidly, but also assists in the purchase of new to replace depleted material. The two-store idea certainly is a good one, one being used for raw material and the other for finished parts. In each crib is a card which can be seen at any time, which shows just what has been taken and what time the replenishing order went through. When the new material comes in it is likewise noted and with a regularity that spells systematic application of good shop practice. Two sizes of chassis are turned out by this company, and there never is any confusion of orders, it is said, and no instance has been recorded where there has been a mix-up of orders. Besides the two sizes of chassis there are some four or five models or patterns of bodies fitted, making the work somewhat complex when it is known that sometimes 500 cars are put through at a time or within a season of a few months. In a shop where a good system was an unknown quantity such a proceeding would be impossible and chaos would reign.

To give one an idea of what a factory must stand in the way of bad treatment of cars it is said that while the largest Rapid truck was rated to carry 1 1-2 tons, it frequently was found that as much as 3 tons were carried regularly. Not only are the trucks overloaded, but when in the hands of careless drivers speed is unnecessarily fast. Such a thing as nursing an engine, which is already strained by overload, is seldom done, the reverse being the case nine times out of ten. Thus it will be seen how well it must be made to stand everyday usage under present conditions. As time wears on, naturally things will shape themselves and the truck user will learn that a good motor truck always has been a far better proposition than he supposed it to be. In the Rapid chrome nickel steel enters into the construction. An illustration of the Rapid chassis, onto which are built hotel buses, police patrols, ambulances, wagonettes, sight-seeing cars and trucks of every design, appears.

In the chassis illustration will be seen the spring suspension, which is somewhat novel. The platform pattern is adhered to but supplementary springs are used as well, being placed over the axle in the case of the rear one and under the seat position in front. In each case these supplementary springs are placed crosswise and alleviate any listing that would occur from overloading at one or the other side without the supplementary springs.

Each piece or screw of this chassis has a number, name and code word by which it may be ordered, which helps to make the perfect system referred to above. Also illustrated is the jackshaft construction, which is good. Usually a jackshaft on a truck is a more or less neglected part—a sort of go-between which becomes neglected in the same manner as the chains, finally giving trouble. The Rapid jackshaft is a nice piece of work and is in keeping with the rest of the car. Timken bearings are set in the ends of the seamless steel tubing, all of which is supported and aligned with a perfectly brazed sprocket.

The same inspection is given to such parts as is received by the engines or other more important essentials. Another novel point is the manner in which the valves are set, being both air and water-cooled. The illustration shows a sectional view of the valve pocket, the part A being the point where the valve seats and B the stem groove, the design forming a simple water-air surrounded arrangement and accessible. Part C shows how the valve can be taken out. The valves are mechanical and the intake port permits the gas to enter and be drawn in to the cylinder without a great amount of vacuum or eddies. The manner of taking the valve casing out is also good, the illustration

showing the two pieces, the inner piece, when released, sliding out in a manner similar to the French pocketed valves, which usually are fitted into the head of the vertical four-cylinder engines.

Pointers in the Design of the Oakland.

Among the new cars of the last year or so may be named the Oakland, another of the products of the busy brain of Alanson Brush of Cadillac fame. This car, like others which have been designed by Brush, is full of novelties. The engine particularly is interesting. In the first case it is a two-cylinder vertical motor of the usual French type. The Oakland motor, besides being a two-cylinder vertical engine, also is a vibrationless two-cylinder affair. When the two-cylinder vertical idea is broached to an engineer in this country he at once nails your argument by the claim that the two-cylinder horizontal is better.

In the Oakland product there is a set of balance weights theoretically worked out in a manner to produce a compensating action for both the vibration and the explosion torque. The means of procuring this is novel in the fact that it is simple and adds but little extra expense for the increased advantages. In the illustration a view of the complete engine is shown with explanation of each part. By noting this closely it will be seen that gearing is the means of accomplishing the action of the counter weights, A and B, by the revolutions of the engine shaft. To the left will be seen the driving mechanism of the valves and to the right is shown the ball-bearing balance weights, A and B. These weights are placed on an eccentric shaft to procure variations in setting, as it is very essential to get the compensating balance weights perfectly adjusted in the beginning. It will be observed that the crankshaft weight can balance only one thing and that is explosion torque, the vibration occurring presumably immediately after the explosion. If this is the case—and we know that the vibration of a vertical internal combustion engine is in a lateral direction—then there are times in the revolution of the crank that the weights are accomplishing little; that is, at one moment they produce a great resisting element and gradually cease to have retarding action the further the crank turns away from the point where the explosion occurs. Naturally, these weights are revolved by the turning of the crankshaft, to which are attached the usual balance weights, designed in this case, however, with special reference to the action of the counterbalancing device, which is what serves to make the Oakland motor one of the quietest running of its type.

Now this fact is apparent in all two-cylinder vertical mo-

Design of the Valve Pocket of the Rapid.

tors and would be observed in the Oakland but for the counterweights, A and B, which come into action when they are wanted; namely, when the vibration sets in. It is plain that a large percentage of the vibration of the two-cylinder verticle engine has been done away with. One demonstration which was made was that of placing a lead pencil, point upwards, on the top of the cylinder and running the engine at something under 500 revolutions per minute without vibrating the pencil off the cylinder.

Another point is the apparent extra power shown. While the horsepower formula, such as adopted by the A. L. A. M., would show 8 horsepower—the two-cylinders producing 16 horsepower—it is a fact that the Oakland engine seemed to do better work on the road. There seems to be greater activity under all conditions than on any similar car; the pick-up is very noticeable, and with the engine running low the acceleration is quick on hills, considering the load that was being pulled. It appeared that reducing the vibration brought about a freer engine action.

The transmission is another novel feature. It has two speeds forward and one reverse, and is attached to the driveshaft under the front seat. It is a planetary gearset, but instead of brake bands it has clutches which run in oil carried in the aluminum case. The claim made is that in the ordinary planetary there is always a drag which is entirely overcome by this new clutch principle. The illustration shows the design of the casing E:

Plan View of the Two-cylinder Horizontal Engine Rapid Commercial Chassis.

Plan View of the Oakland Motor.

Part Section View Showing Cooling Flanges.

Oakland Gasoline Tank Lock.

with one side cut away. The part A is the clutch ring shifting arm, that marked B the high speed clutch lever shaft, and C is the slow and reverse clutch ring. The high speed clutch D is a multiple-disc affair and is self-locking, the speed being thrown in by the side lever and separate from the others. The low speed and reverse are manipulated by the pedal, and the ease with which these clutches are worked is certainly gratifying. The clutches work longitudinally and are cone-shaped. F are the planetary gears, G thrust bearings and H a universal.

Oakland features are all Brush, and that means that there always is more than one way to do anything. As in the case of the Brush car the head of the cylinders is fitted with a most accessible cap of a diameter larger than that of the piston and set in by a coarse thread which insures it being gas-tight as well as easily removed. An illustration shows this cap, A, and also the valve cap which is beside it. The cooling of the cylinder head cap is procured by fins, F, cast into it. The water-jacketing of the cylinders is well designed and made to take in the full stroke of the piston. The oiling system also has some unique points in that oil grooves are used to deliver the oil to the proper places and in the case of the transmission an outside lead is fitted to the tank which leads to the transmission casing. The lubricator is set close to the cylinders to insure proper feeding in cold weather. On the gasoline tank is fitted a lock which prevents any tampering with the car in garages and such places, a commendable arrangement. It is these little refinements which the autoist appreciates in these days of the successful car. It is

Sectional Elevation of the Oakland Motor.

said that a big market is expected in the near future in the taxicab line for this little car—a use for which it is admirably suited. Maximum economy of maintenance in constant service of the strenuous order called for by this usage is claimed by the makers, and when the car and its possibilities are better known, it is expected these claims will be found to be amply borne out.

Ford Has a Great Deal Up His Sleeve.

Calling at the Ford plant the writer found numerous new ideas being worked up, but as Mr. Ford was not as yet ready to have anything published the Ford secrets remained secrets. However it was noted that at this place there was no sign of a slump. The very morning the writer arrived, at 10:30, orders to the number of seventy-three had already been received for the little runabouts. On the second morning he was told also of an order for 100 cars arriving from England. Three-point suspension still reigns supreme here, and some of the new machinery which the company has been installing the past winter was shown. It was apparent that a great amount of money was being spent by this concern and that it now is a fact that vanadium steel is entering into the construction of Ford models—old and new—to a very great extent. Eight ovens were already placed for heat-treated vanadium and four large hammers were available for quick working. Most of the new machinery was especially designed, and the designs are the sole property of the Ford company. From the appearance of the place it was evident that the Ford was soon to spring another sensation on the public, but just when that will be, probably only Henry Ford himself knows, and that means there will be nothing known about it until Mr. Ford is good and ready, which will be when everything is ripe and not before, for it has always been a Ford plan not to make any public announcements until everything was in readiness to back them up. No one who has not visited a representative automobile factory can conceive of the amount of preparatory work that is involved in placing a new model on the market, where it is to be turned out in numbers.

Oakland Planetary Gear Set.

How a Big Red Car Linked the East with the West

By Roger W. Power

THIS story is the record of being so sandy that we had to drop into the intermediate gear and could not accomplish more than 107 miles for the day. To South Bend, Ind., the same

conditions continued, necessitating further use of the intermediate. We pushed ahead and reached Valparaiso that night. Along the banks of the Kankakee river, near the border line of Indiana and Illinois, there is some magnificent scenery, the road leading for about three miles through a vast forest lying in a swamp formed by the overflow of the Kankakee. The path cut through the wood allows the passage of only one team at a time, so that we were compelled to hurry through, blowing our horn all the time. Here and there among the massive trees strung together with festoons of vines would be found an open spot where the water would be lower and a small island of green would be formed. All this, mingled with the song of the birds, made it a spot at which we would gladly have lingered.

number of the fair sex, laid up a store of pleasure, the memory of which will be carried along to a very distant future. Palmyra, N. Y., to Salt Lake City, Utah, does not include the entire distance across the breadth of the United States, and, technically, we are excluded from the ranks of the transcontinentalists, for we did not see either ocean; but there was a prelude which must be added to our record in the form of a run from Peoria, Ill., to Mormon Hill, in the northern part of New York State, where Joseph Smith, the founder of Mormonism, is said to have dug up the "Golden Plates."

We were fully loaded up for a 5,000-mile tour when we pulled away from the National Hotel, Peoria, Ill., our united weight, with passengers, trunk, four grips, and extra tool box, tipping 4,350 pounds. A bolt sheared off one of the front springs before we had passed out of the State. We discovered it while lunching under a delightful canopy of green, finished our meal in true picnic style, pushed on to Fairbury, and had the defective piece of metal replaced at a cost of five cents. This proved to be the only outlay we had to make for repairs on the entire journey. We ran out of gasoline when three miles from town, strayed from the right road when near the border line, and had to suffer axle deep mud as a consequence, and finally were responsible for the death of one of Michigan's big white roosters. But as it was impossible to shift the responsibility for any of these adventures, we were well satisfied with the way in which our Glide had carried us to the deck of the Eastern States, bound from Detroit to Buffalo.

All Well Aboard, Bound for Far West.

A brief visit to Mormon Hill and other points of interest, and at high noon on August 2 we "gasolined" out of Palmyra, N. Y., for the far West, all well on board. Batavia housed us that night, and Buffalo and the Falls had our company for the next twenty-four hours. Our first puncture came just after a stop at the Falls to have a tire vulcanized, and was caused by a thin wire nail pricking a hole through the casing. It required some navigating sense to get through Buffalo with its maze of cross cutting but as soon as the shore road was struck complications ceased and fine roads were our lot. Three hours out of Erie the expert was dissatisfied with the way in which the carbureter was attending to business and ordered a stop which proved to be of short duration and did not prevent us reaching Erie for dinner. Some of the hills west of Erie were sufficiently formidable to tackle the full power of the car and though the roads were good, we had to slip into the low gear and literally crawl to the top. Going down it was necessary to lock the brakes. After lunch at Conneaut, a pretty little town with a hotel that holds out a real welcome to automobilists, we replaced a tube on the right-hand rear wheel in exactly fifteen minutes. By 6 o'clock we were rolling over the smooth surface of Euclid avenue into Cleveland, and at nightfall were on board the *St. Ignace*, bound for Detroit.

The changes which we made in our western route to Peoria did not bring with them improved roads, the going through the picturesque country from Clinton to Coldwater

After bad roads from Effner to Watseka, Ill., where we passed the night, we pulled out, and at Gilman picked up the trail of a Thomas Flyer, which we followed to Forrest, obtaining a better road than the one we had going east. Running between Chenoa and El Paso, a big farm team loaded with people going to church came towards us. When almost opposite, the two horses shied, there was a mix-up which resulted in a broken strap and gave a slight scare to the ladies of the party. The payment of \$1.50 made everybody happy, and we proceeded on our way, only to be stopped a little later by a puncture, which we righted on the schedule time of fifteen minutes. When we ran into Peoria again our total expenditure for repairs, excluding the compensation for broken strap, was five cents.

Starting Out for Adventures in the West.

After the car had been looked over at the factory, we proceeded westward in a cloud of dust caused by a big six-cylinder ahead of us. We stood it for half an hour, then dropped into the rear to get a little breath, putting on a spurt soon after and passing the six.

There was some real excitement late in the evening when running from Macomb to Carthage. The night was dark and the road a difficult one to follow, our only direction being to keep the main traveled road, and we "couldn't miss it." We thought we followed out the simple rule of conduct, but something must have been amiss, for we suddenly found ourselves in the farmer's back yard, where our brilliant headlights caused a terrible scare among the women folk. Either the farmer's powers of explanation were weak or our comprehension was dull, for after a long talk we had made so little progress that we asked the farmer to go with us, promising him a good automobile ride and a journey home on the cars. He thought it over for a while, then said he guessed he would do it and luckily for us he did, otherwise we would have had to camp out somewhere in the woods. When we pulled into Carthage it was 11 P.M., all of us dead tired and glad to turn in for the night. Before we got into Burlington, Ia., the next night, and covered 2,000 miles, we had a little trouble getting on the old river boat *Eloise*, which carried us across the Mississippi to a well-earned rest that all of us were mighty glad to avail ourselves of, as a day's drive makes one ready for bed.

As the real pioneer work was expected west of Omaha, Neb., we spent a day in that town making preparations. The commencement was good, for, although there were hills out of Omaha, the road was macadamized and paved with brick, so that we could bowl along in fine style without any interruption. After Fremont, we dropped into a lot of quicksand and only pulled out after throwing sunflowers and bits of boards under the wheels. After Schuyler, where an excellent hotel provided an excellent lunch, we struck a perfect, hard, level road which allowed a speed of 25 to 30 miles an hour, and enabled us to run up a total of 166 miles when we put into Grand Island for the night.

An Indiana Auto

A fishing party

Near
Lima, Ind.

Along the Kankakee

As we ran further into Nebraska the country changed, the little streams and the groups of green bushes, which were so plentiful in Iowa, giving way to a vast expanse of level and dry country as far as the eye could see, often decorated with golden sunflowers for miles and miles. Along the banks of the North Platte river as far as North Platte City the road was hard and smooth, reminding us forcibly of the Lake Shore drive along the south side of Lake Erie. Not until we had passed Sutherland did we get our first experience with a Nebraska sand-draw, causing long and wearisome labor, which might have been avoided by crossing the South Platte river at Paxton and taking the road on the opposite side.

At Julesburg, Col., we took a guide who showed us a way over the hills which gave a shorter and better route than the one by the railroad. At Chappel, Neb., our guide left us and we continued alone to Sidney, stayed there all night, and next day ran to Cheyenne, Wyo., over fine hilly roads.

Magnificent Automobiling on the Heights of the Rockies.

It was from Cheyenne that the real hill climbing began, our morning run to Laramie, only 67 miles away, giving us a climb of 8,100 feet to the top of Sherman Hill, the highest point in the Rocky mountains. It was a magnificent climb, over a roadway that is a boulevard of disintegrated granite, allowing us to skim along at a speed of 25 miles an hour for the entire distance. As if to crown the beauty of the ride, from the top of the hill by the side of Oakes Ames monument, a fascinating view is obtained which embraces mountain range upon mountain range, each rolling away in the distance like mighty billows of blue. With regret we left the spot and began to wind down through the canyons and gulches of the mountain side with never a bump or jar to mar the pleasure of gliding through the cool mountain air.

We considered it advisable at Laramie to enlist the ser-

vices of E. A. Buck, a civil engineer, to guide us through the little-known and often dangerous mountain wildernesses. On the Laramie plains some Denver tourists advised us not to attempt to reach Saratoga by the Rattle Snake Canyon route, a cloudburst having rendered the road impassable. Our guide concluded, although unfamiliar with the route, that it would be better to attempt to cross the divide by what is known as Pass Creek, and changed our line of march accordingly. A couple of large Packard cars, bound for the town of Hanna, followed us until they both became mired in a swamp which we had had the luck or the wisdom to avoid. Further on we had our difficulties in the shape of roads filled with rocks and furrowed to a depth of 18 to 20 inches, but they were all overcome by a responsive engine and enthusiastic workers.

By 3 o'clock in the afternoon we had reached the Medicine Bow Junction, crossed the river bearing the same name, turned south and wound round the side of the Elk mountain in Wyoming, to Pass Creek divide. After two hours' plodding the trail had faded away in the mountain grass, and we were compelled to turn back seven miles to a ranch house to

learn where we were. It appeared that we had not been following the trail to Pass Creek at all, but that a road which turned sharp to the right at the ranch house was the right one. "It's a terribly rough road," vouchsafed our informant, which was not at all pleasant news for us, for on our seven-mile return journey we had had the misfortune to puncture our reserve gasoline tank and lose all fuel but that in the ordinary tank. Though it was 6 o'clock, we decided to push on, get over the divide, five miles away, pass down the other side, and reach Saratoga that night.

A
Nebraska
"Sand
draw"

How Nature Was Victorious in an Unequal Struggle.

Darkness came upon us as we climbed up the almost impassable mountainside, and wound round chasms through which the water rushed hundreds of feet below. Finally, even a racing engine and the low gear were insufficient to the task, and we could only make progress by getting out and giving external aid. At 9 o'clock at night, high up in the darkness, with only the company of the quaking aspens, an examination was made of the road ahead and the resolution arrived at to abandon the attempt. We felt like deserters as we left the faithful car high up on the plateau, 9,000 feet above sea-level, and started to trudge the three and a half miles to

the rancher's house. We were received with a hospitality that is worthy of more than a mere passing mention. When Mr. Nelson, the rancher, learned that we had left our car up near the divide, he told us he owned a wild bull, who reigned supreme in that vicinity, and who would certainly destroy the red car if he and his family discovered it in the morning. In consequence our driver, Harry Russ, went back with the rancher and brought the car down the steep declivity, reaching the house at 2 o'clock in the morning. There were five pairs of staring eyes, and five busy tongues when the children came out next morning and found a big red automobile in their yard, the first that had ever been in their vicinity.

With three gallons of gasoline in our tank and no possibility of obtaining more, and the assurance of the rancher Steele, then across the Platte river as best we could. At that it was impossible to go down the Saratoga side of the hill, on account of the sharp turns, rocks and precipices that would be encountered, we felt, to use a colloquialism, "up against it." Our best plan appeared to go back to Fort Medicine Bow, but a man with a moving-picture show had fore-stalled us and taken every drop of gasoline the place possessed. But there was a telephone which enabled us to get Hanna for ten gallons to meet us on the road.

As we saw with our own eyes, the bridge over the North Platte had been swept away, the only means of crossing being by the railroad bridge. There being no alternative, we ran our car a mile down the track, rushed it up the embankment, and crossed the bridge 60 feet above the water, on the railroad ties. It was a thrilling experience, for behind us was a big, impatient freight train.

From Fort Steele to Rawlins, and from Rawlins over the Red Desert to Creston, there was not much fault to be found with the road. But when we began to climb down the grade to Bitter Creek and wound along by that famous stream, through its gullies and washouts, we discovered that the difficulties of the preceding days were but a prelude to greater trouble. With tire chains on and the engine devel-

oping its full power, it was impossible to get through the heavy sand without the use of the shovel. Two miles out of Hallville we had a puncture; two miles further on we had a blowout; half an hour later there was another blowout. So we were delayed, while Rock Springs, the only town which could offer any accommodation, appeared an interminable distance ahead. After numerous escapes from toppling off the washedout road into the creek, we finally reached the town, tired enough to hope that the next day would be easier.

P. W. Spaulding, an enthusiastic autoist and a lawyer, of Evanston, Wyo., met us at Green River and proposed to guide us to his home town. He reported that the Black Fork river was high, and that it would be dangerous to attempt to ford it, but believed that we could cross the railroad at Bryan, and by traveling to the north of Granger over an old trail, reach there without doubt that evening. We followed the old trail, but did not reach Granger. At 9 o'clock at night we were stopped by a gully about 50 feet deep with 18 inches of water and sand at the bottom, and with sides so steep that no vehicle could get down, or if it did, could not possibly get out again. There was nothing for it but to stay there all night. Some of us slept on the ground, or tried to, and others made themselves snug in the automobile. After a night spent listening to the coyotes and watching the rising of the moon, we were on foot with the first twitter of the birds, scouting about for a way to cross the gulch. None was to be found, so we returned to Bryan, loaded our automobile on a flatcar and ran across the Black Fork river, after which we unloaded, ran the car through Echo Canyon to Ogden, and then on to Salt Lake City and home.

Our journey had given us a record of 3,626 miles, over roads or no roads that sometimes necessitated the use of block and tackle, but never developed a defect or a weakness in the car. To-day it is running in as perfect condition as when it left the shop in Peoria, and has the honor of being the largest touring car which has ever crossed the Rocky Mountains on the overland trail.

PLANNING FOR BIG MEXICAN ROAD RACE THIS FALL

MEXICO CITY, May 8.—According to J. L. Lawrence, who won the Jalisco cup last year on a 30-horsepower Pope-Hartford, plans are already under way for the holding of the race for the same trophy on a new course to be built at Guadalajara. The race was to have been held last month, but it has been postponed to November next, in order that complete preparations may be made. The work of preparing a racing circuit is in the hands of the Jalisco Automobile Club, and the plans already drawn up provide for a course that will be the best in the Republic for making fast time. It will be graded to an average width of 18 meters, while the curves will be widened and eased off so that better speed will be possible on the turns. Its length is to be increased from 35 to 40 kilometers, and, at the same time, the two railway grade crossings that were a dangerous feature of last year's course, will be eliminated. Numerous general changes in the course will also be made to improve it, and as the natural formation does away with the necessity of using any top dressing, a liberal grading and rolling will make as fine a surface as is to be found anywhere.

It is anticipated that the special committee of the club which has the Guadalajara meet in charge, will spread the program out to cover a week, which will be inaugurated by an endurance run, or touring-car race to Guadalajara from Mexico City. This is scheduled to start on November 5. Several touring car owners have announced their intention of entering for the trip, which will doubtless be a real endurance run, as there are all kinds of roads between here and Guadalajara. No trouble is expected in arranging a program of interesting events that will take up

the entire week, as practically every autoist in the republic will be there, and the attendance is expected to reach fully 10,000 people. There will be motor boat races on Lake Chapala.

Since receiving assurances that there will be no hitch in the arrangements for holding the Jalisco Cup race, there has been a noticeable revival of interest on the part of intending entrants. The Sanchez Juarez Company, of Mexico City, has announced that it will enter two machines, a 120-horsepower Spa and a Renault of the same power. The Compañia Mexicana de Vehiculos Electricos has stated its intention of entering a 60-horsepower Locomobile, a 90-horsepower Mercedes and a 120-horsepower Dietrich, beside which there will be a 90-horsepower Brasier, entered by Juan Cobo. J. L. Lawrence, the winner of last year's race, is slated to drive the Mercedes.

Mexican Auto Club Has House Warming.

Elaborate preparations were made for the formal opening of the new clubhouse of the Automobile Club of Mexico on Thursday, April 23, and the event was a great success. The new building is beautifully situated in Chapultepec Park, on the bank of the lake, and is completely fitted up for the comfort of the members, as well as the accommodation of their cars, the garage being in a separate building at the rear. The club now numbers about eighty members, but there is now a long waiting list, and it is expected that many new recruits will be added in view of the club's move into its new headquarters. The officers are: President, Fernando Pimentel y Fagoaga; vice-president, Rafael Bernal; secretary, José Hilario Elguero; treasurer, Javier Algara.

The "Acme Gearless" in readiness for the push-off.

YOUNG SAVANNAHANS HAVE "AUTO" RACES.

SAVANNAH, GA., May 9.—The youths of Savannah are certainly very much interested in automobile competition. Recently a series of pushmobile races were established, the first of which took place Saturday, April 25. There were 25 starters in the first event, Secretary A. W. Solomon, of the Savannah Automobile Club, sending them away on their ten-lap journey around the Confederate monument in Forsythe Park. The winner was Herbert Miller, whose three pushing mechanics apparently had more windpower than any other trio. Each contestant was allowed three mechanics or assistants, and it was a case of steering and pushing. The police patrolled the course, and while there were a few skinned knees and considerable torn clothing, there were no fatalities to mar the successful event.

For the May 2 race, J. E. Finney, the Acme agent, offered a handsome cup, to become the property of the driver who wins it three times. Edward Pacetti Jones, who raced under his foreign sounding intermediate title, and whose car bore the significant "No. 23," not only had the coveted honor of bearing away the Acme silver trophy, but received an enlarged photo of himself and his team of power plants, a baseball mit and \$3 in cash. No racing driver ever had half the glory that this winner of the southern "Vanderbilt junior" received when he was tossed on the shoulders of the crowd that cheered him. In the great race, which was the third event, the Jonesless driver brought "23" over the tape a full hundred feet ahead of No. 33, with Malone at the wheel, while McLeod, No. 20, came home third.

Nearly 60 machines were entered, and the send-off of the first race presented a confused maze of white streamers and goggles, lost beneath a wave of shouts that showed some of the motors to be wasting their windpower on other things than propulsion. "Prohibition" and "Red Devil" took the lead abreast and kept together for some time, but the devil won out in the end. According to one of the motors, "We do the work and

Line-up for the Hair Raising Contest—No. 23 Winner.

the driver just drives," but it took no little skill to pilot a car through the maze of fifty odd machines on a narrow course. "Death turn," just southwest of the monument, caused many a spill, and the daring driver who showed great skill there was christened the "big wiggler." The officials included Mayor Tiedeman and President Battey, of the automobile club.

Another race is scheduled for May 16, for which John E. Finney has donated a challenge cup, to be won three times before it becomes the property of victorious driver.

SAVANNAH CHALLENGE CUP READY TO AWARD.

SAVANNAH, GA., May 9.—The Savannah Challenge trophy, won by Strang in the Isotta in March, has now been completed, and as soon as it can be suitably engraved, will be forwarded to New York, to be awarded to the winner. The accompanying photograph is the first that has been taken of the new trophy, and shows it to be a handsome specimen of the silver worker's art. The center panel, which dominates the decorative scheme, is

Handsome Savannah Challenge Cup Won by Strang.

occupied by a half-figure of General Ogelthorpe in high relief, while the ornaments are all suggestive of Georgia scenery, such as the palmetto, Spanish moss, and cotton. Round the nine-inch ebony base are plates representing cotton bales, designed to be engraved with inscriptions concerning the race, a new plate being used for this purpose each year. The cup stands twenty-seven inches high, and makes a most appropriate trophy.

NEW YORK STATE HIGHWAY WORK.

Since 1898 the State of New York has completed 978 miles of improved highways at State, county and town expense. The State now has 1,034 miles of roads under contract and 977 miles of roads waiting the letting of contracts. In 1906, the State appropriated for highway improvement \$5,000,000. In 1907, \$3,000,000, and in 1908 \$3,000,000, making \$1,000,000 available now, and \$2,000,000 available in the fall. The appropriation, therefore, is as large this year as it was last, and it is expected that the increased amount of interest in the good roads movement will be responsible for pushing this work more than in former years.

Thomas Flyer Which Has Been Slightly Changed by Increase of Bore for Grand Prix—Driver Strang and Mechanic Marquise Are Aboard.

AMERICA'S CANDIDATE FOR FRANCE'S GRAND PRIX

MAY 20 a Thomas Flyer will be shipped abroad for a try at the Grand Prix, the blue ribbon of European automobile racing, scheduled to take place over the Dieppe circuit on July 8. Louis Strang, with John B. Marquise as his mechanic, will go as the car's crew. Harry S. Houpt, whose enthusiasm, enterprise and liberality have in the past contributed so largely to Thomas racing prestige, will accompany them as manager, mentor and trainer.

When E. R. Thomas, with characteristic enthusiasm and patriotism, essayed to make an entry for the Grand Prix, he had in mind the construction of a full team of three special racing cars, so as not to be behind his European rivals in preparedness for the great test. Pressure at the factory, however, in getting out the 1908 models left no time or opportunity for the extra work of designing and constructing a trio of racing machines. Instead of a trio of racers, he will, of necessity, have to pin his chances to a single stock car, whose only variation from the standard model turned out for customers will lie in the bore, being 5-8 of an inch larger than that of the regular stock Thomas Flyers. There has not even been time to satisfactorily try out the present car, which is, of course, far from a racing car, when one compares it with the specially built and long-tested European cars that the Thomas will have to go against.

In securing Strang and Marquise, who manned the victorious Isotta at Savannah and Briarcliff, and prevailing upon Mr. Houpt to accompany them as manager, Mr. Thomas has shown characteristic forethought. His car will be assured of the best driving and handling that the United States affords. That the attempt will result in more than the Thomas demonstrating the lasting qualities of the best American stock cars under high speed road conditions, Mr. Thomas has little hope, in view of the handicap he has shouldered.

Mr. Houpt a Conscientious and Energetic Sportsman.

Mr. Houpt was the first to give the Thomas a try in an international race. How he put up Montague Roberts in the first Vanderbilt elimination trials and won a place on the team, only to have his car shelved in favor of an arbitrary selection by the committee then in charge, is racing history. Mr. Houpt's attempt, however, was at the bottom of the serious try Mr. Thomas made in 1906 for Vanderbilt Cup honors, when he built at an enormous expense three racing machines and engaged Le Blon and Caillois, two French cracks, to drive two of them, his

return being the beating by Le Blon of all other American cars in the race. The long period of uncertainty as to the completion of the Long Island parkway ending in the abandonment of the Vanderbilt race of 1907 discouraged Mr. Thomas from his purpose to build other cars for another try. Grand Prix rules and restrictions prevent his using the three racing cars on hand.

The Thomas will not enter the race by any means unknown to European followers of automobiling. The beating it gave the French, German and Italian cars across the American continent in the New York-Paris race has given the Thomas an enviable introduction to foreigners. Mr. Thomas hopes that a creditable stock car demonstration in the Grand Prix will confirm the reputation his around-the-world car won. He really can hope for little more.

To-night, at the Hotel Marseilles, New York City, Mr. Houpt is to be the recipient of a dinner given in his honor by the Thomas staff and employees of the metropolitan district.

GRAND PRIX COURSE CLOSED TO RACERS.

PARIS, May 9.—Racing cars have been forbidden access to the Dieppe course since the first day of the month, the penalty for infraction being disqualification in the Grand Prix. The Racing Board of the Automobile Club of France declares that this measure is necessary in order to safeguard the interests of the public and to allow the work of road repairing and tarring to be carried on with greater activity. Knowing that they would be deprived of their practicing ground Grand Prix drivers have been busy on the course, nearly every man engaged in the race having been round during the last few days of April on either fast touring cars or racers of last year's vintage. Very few of the 155-millimeter machines are yet ready, the only ones on the road at the present time being Renault, Panhard, Bayard-Clement, Motobloc, and Benz, this latter being handled by Hemery.

Prices for the boxes at the official grandstand have been fixed at \$90 for first boxes with 9 places, \$60 for the first boxes having six seats, and \$36 for the second row boxes, also with six places. Second row boxes, also with four places, are offered at \$24. Individual places are being sold at \$4 and \$3 each. For the voiturette race on July 6 there is a lower tariff, the reduction being about 25 per cent. Garage charges are fixed at \$1 for the first day and \$2 for the day of the Grand Prix.

Contrary to the usual custom the weighing-in ground will this year be open to the public at a charge of 40 cents per person for the voiturettes and the heavy cars.

The drawing of places for tire, gasoline, and oil stands opposite the grand stands took place by lot last week, the Racing Board holding this much earlier than usual in order that constructors who desired to do so might have grandstand seats opposite their depots. Any later engagements, either for cars or depots only will be given the remainder of the boxes in the order of their engagement.

Callois and One of the 1908 Renault Trio.

BRITAIN ADOPTS LIMITED BORE FOR RACE.

LONDON, May 9.—In place of the fuel consumption race on the Isle of Man, which the Royal Automobile Club of Great Britain considers to have outlived all useful purposes, England will this year have a purely sporting event familiarly known as the "four-inch race." As in the Grand Prix, the essential features of the regulations are maximum bore and minimum weight. The Britishers, however, consider 155 millimeters too great a bore for four-cylinder cars, and are probably right in view of the nature of the course available for the race. Under the formula adopted practically only four-cylinder cars of 4-inch bore will be eligible, the weight being a minimum of 1,600 pounds without driver or mechanic, gasoline, oil, water, spare parts, tires, or tools. The formula reads: "The race is for cars the D²N of whose cylinders shall not exceed 64, equal to the R.A.C. rating of 25.6 horsepower. There must be not less than four working cylinders." D²N equals diameter of cylinders in inches squared and multiplied by the number of cylinders.

Under the Ostend agreement England has the right to conduct an international speed contest on other than the 155-millimeter rules, the understanding being that races for smaller cars could be held, but that no speed test should be held for machines of more than 155-millimeters bore for four cylinders. It is believed that in nearly every case practically stock chassis will be entered in the British race.

Though no course has yet been decided upon, it is almost certain that the race will be held on the Isle of Man sometime in the Fall. Entries, which must not exceed three per firm will be received at the rate of \$175 per car until July 1. Final closing, at increased fee, will be on August 1. With the exception that both dismountable wheels and dismountable rims will be allowed, the regulations governing the race will be similar to those of the Grand Prix. Thus all work must be done by driver and mechanic; there will be two depots for fuel, water, oil, and tires, and the use of oxygen, acetylene, etc., will be prohibited.

NINE CLASSES FOR JAMAICA STRAIGHTAWAYS.

Announcement has been made of the card for the straight-away time trials to be run at Jamaica, N. Y., on June 5, under the joint auspices of the Subway Celebration Committee and the Long Island Automobile Club. The events are:

- Gasoline stock cars under \$1,250.
- Gasoline stock cars from \$1,251 to \$2,000.
- Gasoline stock cars from \$2,001 to \$3,000.
- Gasoline stock cars from \$3,001 to \$4,000.
- Four-cylinder stock cars over \$4,000.
- Six-cylinder stock cars over \$2,500.
- Free-for-all, all types and motive powers.
- Steam stock cars.
- Stock chassis having 301 to 550 cubic inches piston displacement.

All these classes prevail for the kilometer, mile, and two-mile distances, at which the time trials will be run. Separate entries, however, are required at each distance. The entries will close Monday, June 1, with Fred J. Wagner, assistant secretary, No. 29 West Forty-second street, New York. The entry fee for each car is \$15 for the first and \$5 for each subsequent entry.

Hemery, 1905 Vanderbilt Winner, Now Drives a Benz.

Heath, 1904 Vanderbilt Winner, Still Drives a Panhard.

EVENTS FOR DEAD HORSE HILL CLIMB.

WORCESTER, MASS., May 12.—The hill-climb committee of the Worcester Automobile Club having the arrangements for the third annual Dead Horse Hill climb in charge have decided to have fifteen events, all open to stock cars only. Men are now at work putting the Leicester end of the big hill in shape.

The committee is confident that the record of the hill of 1:01 2-5, made by the Darracq of Samuel B. Stevens, driven by A. L. Campbell, May 25, 1906, will be smashed.

New Factory of the Ajax-Grieb Rubber Co., at Trenton, N. J.

AJAX TIRE PLANT'S HOUSE WARMING.

With Governor Fort, of New Jersey, and Mayor Madden, of Trenton, as sponsors, and two hundred men prominent in the sport and industry as witnesses, the new plant of the Ajax-Grieb Rubber Company, at Trenton, was christened last Monday with due ceremony and much congratulatory jollification. There were speeches, not too many of them, a luncheon, vaudeville, bridge and pinochle tables, and an inspection of the new factory that was most instructive, interesting and impressive. Altogether the entire celebration spoke well for the generosity of the hosts and the confidence of the company in returning business prosperity.

The guests arrived in two special trains, the one from Philadelphia bringing forty Quakers and that from New York a bunch of 149 Knickerbockers. Landed by a private siding at the factory, the visitors were bidden by President Horace De Lisser to climb to the top floor of the main building, where Mr. Grieb was on hand to welcome them. The spacious room was hung with flags and bunting, and at one end a platform was erected. There was a long wait before Mr. Grieb arrived in a Ford, driven by Louis Block, with Mayor Madden, and a still longer one before Mr. DeLisser showed up with Governor J. Franklin Fort in a Maxwell, whose pilot for the occasion was J. D. Maxwell himself. There was a great snapping of cameras. New Jersey's Governor and Trenton's Mayor were loudly cheered as they proceeded to the platform.

President DeLisser began the factory's inaugural ceremonies by declaring that he was never so happy as when entertaining his friends, and that to-day his cup of happiness was running over. He paid a graceful tribute of gratitude to his associates and backers in the enterprise, mentioning by name Benjamin Briscoe, J. D. Maxwell, Henry Ford, James Couzens and William Mitchell Lewis, not forgetting William and Harry Grieb, R. A. Patterson and Alfred Reeves, associate directors, and paying a further compliment to Louis P. Destribats, who designed the factory. In conclusion he thanked Governor Fort and Mayor Madden for assisting at the christening.

Governor Fort made a happy and humorous address. He said he had kissed babies and attended banquets, but this was his first experience at starting what he knew would prove a great industry. He exhorted New Jersey as a State of great achievement and complimented Trenton on being the only State capital that did not have to live off of its Legislature. The starting of this plant gave great promise for the future. Pointing to the Ajax poster, he perpetrated the pun that "though Ajax tires, no one will ever tire of Ajax tires." He hoped the enterprise would prove as prosperous as the girl on the poster was beautiful.

Mayor Madden was brief in his remarks, confining them to the statement that the starting of this new factory at this time was a most encouraging sign of returning prosperity, and the wish that the enterprise might meet with success.

Then Governor Fort pressed electric buttons that set the wheel of the great Curtiss engine revolving and the rollers and grinders to work. Mr. DeLisser concluded the ceremonies by

inviting all hands to go below and see for themselves that the best rubber that could be bought was put in Ajax tires. The invitation was accepted, and the refining, mixing and calendaring processes were viewed with interest.

The new Ajax-Grieb plant consists of three brick buildings, one of three stories, 60 by 190 feet; a one-story press room, 80 by 200, and an engine and boiler room of one story, 40 by 90, giving 53,800 square feet of floor space. The acreage of the factory grounds is eight acres.

The founder of the enterprise was Horace DeLisser, who was formerly sales manager of the International A. & V. Tire Company. The company, which was founded on November 24, 1905, had the backing of the leading makers of the A. M. C. M. A., and fought the then existing tire combination. The first tire was completed January 1, 1906.

The Maxwell-Briscoe Motor Car Company was represented by Benjamin Briscoe, J. D. Maxwell, Frank Dorman and Richard Irwin; the Ford Motor Company by Louis Block, its Philadelphia branch manager, and W. L. Huston, president of the Standard Motor Car Co., of San Francisco.

ASSOCIATED CLUBS ATTACK JERSEY LAW.

NEWARK, N. J., May 11.—At a meeting of the Associated Automobile Clubs of New Jersey, held at the clubrooms of the New Jersey Automobile and Motor Club last week, a committee was appointed, with W. C. Crosby, of Newark, as chairman, to secure counsel and begin proceedings to attack the constitutionality of the amended Freylinghuysen law. The license clause will be the first point attacked, but other provisions of the law may also be brought in question. President George Paddock, of the New Jersey Automobile Trade Association, was present, and assured the State body that the dealers would cooperate with the clubs in the proposed fight, while the latter have provided sufficient funds to secure the best legal talent available.

It is anticipated that George A. Post will resign as president of the associated clubs, as he did not desire the office when elected, and has since declared his intention to resign. In the latter event, W. C. Crosby, now vice-president, will probably succeed him as executive.

SILVER PLATE FOR SECRETARY BONNELL.

NEWARK, N. J., May 12.—A noteworthy incident followed the conclusion of the recent annual meeting of the New Jersey Automobile and Motor Club in the presentation on behalf of the members of a silver service of over one hundred pieces to H. A. Bonnell, the retiring secretary, in recognition of his services during the two years of hustling administration. Orator J. H. Wood called attention to the fact that when Mr. Bonnell took up his office the club had but 375 members, and that its roll now numbered over 800. This is so rapidly growing that before long it is predicted that the club will have over 1,000 names.

President DeLisser Gives Governor Fort a Maxwell Ride.

RESULTS ONLY THROUGH ORGANIZATION.

That the automobilists of the country will never obtain and retain conditions most satisfactory for the pursuit of their pleasurable necessity, except through thorough organization—locally, by States, and nationally—is plain.

One of the best organized State associations of the A. A. A. is the Pennsylvania Motor Federation, of which Robert P. Hooper is the enthusiastic president and Paul C. Wolff a most conscientious secretary. Its monthly pronouncement always contains much that strikes the mark exactly. We quote from the May bulletin:

The Federation was organized for two purposes: that it should be a State good roads association, and that there should be a body of motorists strong enough to secure the enactment of fair laws regulating automobiling, or to defeat any unjust or oppressive legislation that might be introduced.

We believe that the State associations should maintain a national body for the same reason that the clubs and individual motorists should support a State organization.

It has always been the experience of most organizers that the many prefer to allow the few to do the work. Gradually the present national association is adding to its State bodies, which in turn are gaining club after club, and the day is not far distant when two-thirds of the automobile users of the country will lend their financial and moral support to bettering the general conditions of automobiling. If there isn't a local club in your vicinity, see that one is formed of at least a dozen members,

for that is the reasonable minimum required for the organization of a club which can become a part of and have a spokesman in the councils of your State association. If there isn't a club, you can join direct as an individual member.

Certainly the surest way to obtain automobile peace is to complete the organization of a widely scattered army of automobile users, necessarily democratic in character, and reaching wherever a motor-driven vehicle adds to the comfort and longevity of life.

EVOLUTION OF THE AUTOMOBILE CLUTCH.

Few better instances of the special requirements involved in the design of automobile parts could be cited than those given in connection with a review of the development of the automobile clutch, part of which appears in this week's issue of THE AUTOMOBILE. Conditions met with are so totally different that precedents are worse than valueless, though, as the writer of the article in question makes plain, there was little data available on clutch design even in the general engineering field, clutch makers having learned by experience what size clutch of their own make is necessary to transmit a given horsepower in machine shop practice. This was the state of affairs that confronted the automobile engineer at the outset, so that it is hardly to be wondered at that clutch troubles formed no small part of early defections.

Chief among the facts brought out by this highly interesting paper is that of the status of the cone type of clutch, which has held its own despite the numerous special types that have been introduced with a view to overcoming what have since proved to be not so much defects of design as lack of provision for the specially hard service to which the clutch is subjected. The discovery of the great value of cork as a friction material has also been instrumental in keeping this type in favor, and its use marks one of the greatest steps in advance where clutch efficiency is concerned.

PROBLEM OF DUSTLESS ROAD BUILDING.

Despite the numerous ideas advanced for the building of an improved type of road, nothing as yet seems to have succeeded in superseding MacAdam's plan. In fact, the problem has somewhat resolved itself into a question of road preservation, and many master minds are now devoting themselves to the subject. Macadam construction has proven itself a superior form for a great many purposes, barring its rather important lack of permanency. In other words, under increased traffic it is subject to more or less rapid disintegration, and it is this feature that road builders all over the world are trying to remedy. Of the various methods experimented with, none yet appears to have proven so effective as the application of hot coal gas tar, which is not merely a surface treatment, as the tar percolates through to the lower strata of the road construction, binding it in an efficient and more permanent manner than has heretofore been the case with similar applications of other materials. Up to the present, this appears to be one of the most successful methods adopted, and the further experimenting now being carried on at Hartford and Savannah should bring out further facts in its favor.

A. M. C. M. A. TALKS OF ITS OWN CHICAGO SHOW

THAT discussion of the idea of promoting an independent show in Chicago along the lines of its policy of holding exhibitions of its own, as in the case of the Grand Central Palace function in New York, occupied some of the attention at the meeting of the Committee of Management of the American Motor Car Manufacturers' Association, held at its New York headquarters on Tuesday, is evidenced by the show committee being empowered to make arrangements therefor. In its official announcement of the proceedings, the Association's publicity department states that in accordance with letters from Chicago, associated in the Western show will also be the Chicago Automobile Club and the Chicago Motor Club.

The question of program advertising was also discussed, with the result that it was voted that in view of the fact that this class of advertising is many times of questionable value, the use of such mediums should be discouraged.

The show committee reported on the arrangements for the Grand Central Palace show, to be held December 31 to January

7, in conjunction with the Importers' Automobile Salon and the Motor and Accessory Manufacturers, Inc. E. R. Hollander has been named to represent the importers on the show committee, and D. J. Post will serve the interests of the Motor and Accessory Manufacturers.

Upon the recommendation of the good roads committee, the association appropriated \$500 for the A. A. A. National Legislative and Good Roads Convention, to be held at Buffalo, July 8 and 9.

There was a full attendance of the Committee of Management, including Benjamin Briscoe, chairman (Maxwell-Briscoe Motor Co.), R. E. Olds (Reo Motor Car Co.), James Couzens (Ford Motor Co.), H. O. Smith (Premier Motor Mfg. Co.), G. V. Rogers (Mitchell Motor Car Co.), W. H. VanDervoort (Moline Automobile Co.), C. G. Stoddard (Dayton Motor Car Co.), S. H. Mora (Mora Motor Car Co.), Charles E. Lewis (Jackson Automobile Co.), Job Hedges, the association's counsel, and Alfred Reeves, general manager.

THE "SOLID SOUTH" WANTS CUP RACE.

NEW ORLEANS, LA., May 11.—The success of the Savannah stock-car races did much for the automobile trade in the South, which is now much interested in the selection of the course for the Vanderbilt Cup race. It is a "Solid South" for Savannah. Dealers in this city, as well as in all the other larger Southern cities, are of the opinion that the holding of this race below the Mason and Dixon line would be the best thing that could happen for the Southern interests.

A local dealer expresses the opinion that the Savannah race awakened more real interest in automobiles, and particularly in the good roads movement than anything else in recent times.

A movement has been started here, and which is about ready to carry into operation, for the building of an automobile road between New Orleans and Baton Rouge. This road is to follow the Mississippi, and when completed will, without doubt, be the best 100-mile road in this part of the country. Then, too, a road is now being built between this city and Chef Menteur on Lake Pontchartrain, which is 25 miles long. This road is built of shells, is white as snow, level and very fast.

Chef Menteur is right in the heart of the fishing and hunting sections. When the road to Baton Rouge is completed this will make one of the finest roads in the country, and about 125 miles long.

CHANGES IN N. A. A. M. REPRESENTATION.

At its regular monthly meeting held in New York City, May 6, the National Association of Automobile Manufacturers received the resignations of W. E. Metzger, as representative of the Cadillac Motor Car Company; V. M. Gunderson, as representative of the Northern Motor Car Company; H. E. Coffin, representing the E. R. Thomas Detroit Company, and E. R. Chapin, the E. R. Thomas Motor Company of Buffalo. Mr. Metzger was then re-elected to succeed Mr. Gunderson as representative of the Northern company, in which the former Cadillac general sales manager is known to have been considerably interested for some time, and Mr. Chapin was re-elected to fill the vacancy caused by Mr. Coffin's retirement. The Cadillac company and the E. R. Thomas Motor Company have not as yet nominated their new members.

WASHINGTON GETS TAXICAB HABIT.

WASHINGTON, D. C., May 9.—Motor taxicabs are making a big hit in Washington, and it is likely several companies will be operating them here before the end of the summer. The Federal Taxicab Co., of which E. R. Thomas is president, was the first to invade the field. Six Elmore taxicabs were placed in service here last week by the New Union Garage Company.

LAND OF EVANGELINE IS DECREED TO BE AUTOLESS

WOLFFVILLE, N. S., May 11.—In order to appease a few irate and misguided agriculturists who look upon the automobile as the incarnation of evil, the Provincial Legislature, otherwise the House of Assembly and the Legislative Council, recently passed an amendment to the motor vehicle law. This makes it lawful for every city, town, or municipality in the Province of Nova Scotia to make regulations prohibiting the use and operation, on certain days of each week, of motor vehicles, upon any of the public highways, etc. So far Pictou county has been the first to take advantage of the law, and has prohibited the use of automobiles within its borders on every day except Monday.

As the direct result of this retrogression to the dark ages, the Nova Scotia Automobile Association has sprung into being, its chief object being the protection of its members against this form of tenth century legislation. The secretary of the new association is W. L. Kane, Halifax, N. S.,

and American tourists who have thoughts of including the "Land of Evangeline" in their itineraries for this summer would do well to consult Mr. Kane in advance before going to the expense of taking their cars to this now hostile country. The prohibitory movement is as yet in its infancy, Cumberland county being the only one that has followed the example of Pictou, though it has not gone to the same extreme, Monday, Thursday and Sunday being the black letter days in Cumberland. But others are quickly falling into line. The County Council of Kings has appointed a committee to confer with the Councils of Annapolis and Hants, to select prohibitory days, with a strong recommendation that only two days in the week be left open. It is currently reported that it is the desire of some of the councilors for each county and town to select different days, thus making the prohibition absolute for all practical purposes. As an example of restrictive legislation the above is about "the limit."

CELEBRATE FOURTH WITH ROAD RACE.

BOSTON, May 9.—To concentrate its Fourth of July celebration into an automobile road race is the idea which has been suggested to the people of Lowell. The scheme of a 200-mile road race on a 10-mile course to the north of the city was broached only a week or so ago, but since then events have been moving rapidly. An organization called the Lowell Automobile Club has been formed, with John O. Heinze, of the Heinze Electrical Company, as president; Frank S. Corlew, prominent in the New England automobile trade, as vice-president; John A. McKenna, secretary, and Harry Dunlap, as treasurer.

This club has applied for membership in the Massachusetts State Automobile Association of the A. A. A., and has also applied for a sanction for its race meeting. In addition, the club has been offered a costly trophy for the race, the donor being Congressman Butler Ames, grandson of General Benjamin Butler, and arrangements are being made to have the militia of Lowell, and, perhaps, of the neighboring city of Lawrence, turn out to do guard duty during the race, it being claimed that the services of the militia can be secured on the holiday without the usual order from the Governor. The roads that are to be used are to be improved where necessary, corners banked, and given a thorough oiling. A large grandstand is to be erected, and the Lowell club plans to invite prominent members of the A. A. A., experienced in road racing, to act as officials. Vice-President L. R. Speare, it is said, has already consented to officiate as referee.

NEW CUPS FOR GIANTS' DESPAIR CLIMB.

WILKES-BARRE, PA., May 5.—All obstacles to an A. A. A. sanction having been removed, the Wilkes-Barre Automobile Club is preparing to make its annual Decoration Day climb up Giant's Despair far bigger and more noteworthy than any former one of the series. John Willis Hollenback's offer of a cup costing from \$500 to \$1,000, to be competed for annually, has been accepted. A feature of the climb will be the patrolling of the course by the C. T. A. U. regiment, an independent military body which has volunteered. The program will embrace nine other events.

The following program has been arranged:

- Event 1.—Gasoline stock cars, \$850 or less.
 - Event 2.—Gasoline stock cars, \$851 to \$1,250.
 - Event 3.—Gasoline stock cars, \$1,251 to \$2,000.
 - Event 4.—Gasoline stock cars, \$2,001 to \$3,000.
 - Event 5.—Steam or gasoline stock cars, \$1,250 to \$3,000.
 - Event 6.—Gasoline stock cars, \$3,001 to \$4,000.
 - Event 7.—Four-cylinder stock cars, \$4,000 or over.
 - Event 8.—Six-cylinder stock cars, \$2,500 or over.
 - Event 9.—Free-for-all types and motive power.
 - Event 10.—Gasoline stock chassis not exceeding 103.87 total piston area.
 - Event 11.—Steam cars.
 - Event 12.—Cars owned by Quaker City Motor Club members.
- Event No. 10 is intended for Briarcliff models and will have a special cup for its prize.

BRIDGEPORT CLUB TO PROTECT CITIZENS.

BRIDGEPORT, CONN., May 12.—The Automobile Club of Bridgeport is to take summary action against the dangerous driving of reckless and incompetent chauffeurs. The subject was brought before the club by complaints against one or two chauffeurs on the occasion of the club run to the Briarcliff race. By resolution, a committee of public safety has been established, which will include a lawyer.

President Staples has appointed the following as the club's delegates to the Connecticut State Automobile Association, which will hold a meeting in Bridgeport, May 30: Frank Miller, F. W. Bolande and Silas Burton. The board of governors has been increased to twelve members.

Robert M. Cranford, of New York, has presented the Cranford cup to take the place of the Gale cup, which he won at last year's hill-climb.

THE THOMAS CAR ARRIVES IN JAPAN.

According to a cable to the *New York Times*, the Thomas car and its American crew arrived at Yokohama on the *Show-mut*, May 10, after an 18-day passage, but, much to the disappointment of the American colony, the car was not disembarked. The foreigners had paraded through the town and received a great reception from their compatriots, and the Americans were eager to show them what their representative could do, but the Thomas, unfortunately, remained on the steamer, being unloaded at Kobe. From the latter place, Schuster will run it over the mountains to Tsuruga with the aid of a Japanese guide, and will take a steamer from there for Vladivostok, Friday, May 15.

The French committee in charge of the race held a meeting at Paris, May 7, in order to pass upon the questions arising from the change of route made necessary by the impassibility of the Alaskan trail. It was decided that the Thomas car be allowed 15 days over its nearest competitor in the trip through Siberia owing to the advantage it lost by going to Alaska, while the committee further decided that the Protos be penalized 15 days for shipping from Ogden to Seattle, thus placing it 30 days behind the Thomas. The Russian committee is said to have made all preparations in the way of fuel and supplies along the route, so that everything is in readiness for the start when the American car reaches Vladivostok.

SILVER TROPHIES FOR LONG ISLANDERS.

BROOKLYN, N. Y., May 11.—In a letter to the members that fairly bristles with evidences of an active club life, Charles Jerome Edwards, president of the Long Island Automobile Club, calls their attention to the fact that the open season for automobiling has arrived, and to the several silver cups offered for club competition.

The membership cup, offered by Louis T. Weiss, will be awarded to the member securing the greatest number of recruits during the year ending December 31, 1908, while the attendance cup, offered by Leffert Lefferts, will be presented to the member attending the greatest number of club runs and contests during the same period. The mileage cup, presented by President Edwards, will go to the member whose odometer registers the greatest distance traveled during the touring season, beginning May 1 and ending November 1, the club manager, H. H. Creighton, keeping a record of the speedometers. Beside the foregoing, there is a touring cup, offered by Samuel H. Burns, for the member who tours in the greatest number of States or Provinces during the touring season ending November next.

The first club run of the season to the country clubhouse at Bay Shore, Long Island, is announced for May 17, while the contest committee announces a series of contests to be held June 5, on Hillside avenue, Jamaica, in connection with the Jamaica Citizens' Subway Celebration.

EVANS JOINS A. A. A. GOOD ROADS BOARD.

PHILADELPHIA, May 11.—Powell Evans, president of the Automobile Club of Philadelphia, has been made a member of the executive committee of the Good Roads Board of the American Automobile Association. President Evans is responsible for much of the recent activity of the Philadelphia club, which is accomplishing excellent work in Philadelphia and vicinity. Secretary S. Boyer Davis is also entitled to a good bit of the credit for recent results.

NEW YORK TO CELEBRATE ORPHANS' DAY.

There is now small likelihood that the New York end of the Greater City's celebration of Orphans' Day will be allowed to go by default this year. The probabilities favor the New York Automobile Trade Association undertaking the promotion of the celebration as the outcome of a conference of its leaders and several charitable outside enthusiasts held yesterday.

AMERICAN LOCOMOTIVE MOTOR CAB.

By B. D. GRAY, CHIEF ENGINEER, Am. Loco. Auto. Co.

IN the motor cab produced by the American Locomotive Automobile Company, of which the first hundred are now being put into service by the Waldorf-Astoria hotel in New York, is found a new attitude toward the economic aspect of the tariff cab for city use. This attitude is the habitual one of this company which believes that building for long service is most economic in the end, even at a slightly greater initial cost.

"Bow View" American Berliet Cab.

Having decided to enter the field the American Locomotive Automobile Company made an exhaustive investigation of the various makes of cabs and the conditions under which they are operated, both here and abroad. The results of this indicate that the requirements of the service are exacting in such a way that a cheaply constructed vehicle is unlikely to be lucrative. It was found to be the experience of some companies that while the gross receipts were ample, the net profit was nil, owing to the vehicles being in commission only about 50 per cent. of the time, and that to be finally profitable such vehicles should be so constructed that they can be kept in commission about 85 per cent. of the time. It is not practicable to exceed this figure, owing to the periodical necessity of repainting and overhauling, and the occasional repairs necessary to the best of power plants.

Engaging in the manufacture of cabs the American Locomotive Automobile Company, for the reasons cited, undertook to produce a vehicle in which the resistance to wear was the prime consideration and the expense of material and construction secondary. Generally speaking, the motor cab is built on the same lines and of the same material, and with the same exacting methods as the Locomotive Company's touring car, which occupies its own distinctive pedestal, the chief feature of difference being in the final transmission of power from the gear case to the rear wheels, which, in the case of the cab, is not by chains, but by a shaft drive. Imported materials are used in such important parts as cylinders, crankshaft, springs, frames, etc. The general specifications of the cab are as follows: Wheelbase, 103 inches; tread, 55 inches; height of frame from ground, 24 inches; weight of cab complete, 2,600 pounds; tires, 32 by 4 inches all around; available body space from dash to rear of frame, 98 inches; width of frame, 34 inches.

The motor is of the four-cylinder vertical type, placed forward of the dash under the usual form of bonnet, bore and stroke, being 3 15-16 inches by 4 3-4 inches; nominal rating, 16-horsepower at 800 r.p.m. Multiple disc clutch is used of the same type as is used in the Berliet cars. The ignition is low tension, make-and-break, with Simms-Bosch magneto. No spark advance is provided, this having been predetermined with the idea of precluding the possibility of an inexperienced driver abusing the motor. In further carrying out

this idea, a governor control is provided, whereby the maximum speed of the motor is limited to 800 r.p.m. This control is extremely sensitive and absolutely reliable.

The lubrication of the motor is effected entirely by splash, oil being fed to the crankcase by means of gravity through a sight feed oiler. As a guarantee against excess of oil and consequent smoky exhaust, hollow plugs are provided in the bottom of the crankcase to maintain a constant oil level, any excess being carried off to an overflow tank through these plugs. Cooling is effected by an extremely efficient honeycomb radiator, the water being circulated by a centrifugal type of pump, which has ample capacity to cool under most trying conditions.

The transmission is of the selective sliding gear type, providing three speeds and reverse, the high gear being direct. The reduction on the high gear is 3.8 to 1, giving a vehicle speed of 20 miles an hour with the maximum motor speed indicated.

The rear axle is, perhaps, the most novel feature of the cab, because of its being a peculiar design, distinctive to the American Locomotive Automobile Company. The axle proper, or the load supporting member, is composed of a one-piece drop forging, consisting of a large central ring and terminating in a tubular section at each end, and the tubular section being ribbed, top and bottom, to the central ring. This forging is so designed as to give as nearly as possible a theoretically correct distribution of metal to perform its several functions. The spring seat and brake anchor are integral and fitted rotatively on this forging, therefore transmitting the braking torque through springs to the frame. Special attention has been given to the location of spring suspension, as that feature makes so much for the comfort of the passengers as well as for the life of the motor.

Hess-Bright (D. W. F.) bearings are used throughout the transmission, rear axle and in the front wheels. Interchangeability has been made a very important factor in the construction, by virtue of which it is possible to replace any of the important elements, such as front or rear axle, transmission, motor, steering gear, etc., from stock, without having to specially fit or line up the part. Accessibility is another important feature, it being possible to examine practically the working parts individually without disturbing other adjacent parts. For example, the clutch or gear-set may be removed as a unit, and the same is true of the motor and rear axle.

Besides seeking to produce a cab to stand the racking of traffic service in the city, it has been the aim to provide a vehicle which shall have the luxurious riding qualities of a private car, and further to equip the chassis with a body as substantial and elegant as for high-class individual work.

Attractively Substantial Lines of the American Locomotive Auto Company's Cab.

Standard Flandrau Landaulet on Packard Chassis.

NEW YORK CITY A BODY BUILDING CENTER.

Few outside of those directly engaged in the automobile trade realize what a center New York City has become for the high class body builders. It held that post of honor long before the automobile came upon the scene, the numerous carriage manufacturing houses who have been in business here for more than half a century having become specialists in the art of body building for the automobile, and it has been extended even beyond what has been customary in the fitting up of the finest carriages. One of the most prominent of the houses in question is Flandrau & Company, 406-412 Broome street, New York, and a typical sample of their work is shown on a Packard chassis by the accompanying photograph. It is the standard landaulet body made by this firm and is designed to seat five passengers inside and one beside the driver, although it can be made to carry six inside if desired. The color scheme in this case was green, the panels being painted in a special shade ground by the makers for this order, while the inside is trimmed with leather made especially to match the color of the paint. The interior fittings, such as the dome light, card cases, foot rest, speaking tube and the like are all of exclusive patterns, the whole design producing a most striking effect in conservative colors.

PIERCE ARROW FOR ST. PAUL FIRE FIGHTERS.

Through their St. Paul agent, the George N. Pierce Company, Buffalo, N. Y., have just supplied the fire department of that city with a car specially built to aid the fire fighters. The car is one of the 45-horsepower, four-cylinder type of the Great Arrow product, its lines being illustrated by the accompanying photograph. The body has been built specially for the purpose, having a disappearing rear seat. The under portion of the body is arranged to accommodate boots, helmets and the other paraphernalia of the fire chief, for whose use the car has been specially provided. The official in question realized some time ago that the usual horse and buggy were not adequate to the requirements and the order for the Pierce resulted.

St. Paul's Fire Chief in His New Pierce Great Arrow.

OIL REFINERS INSTITUTE LITIGATION.

PHILADELPHIA, May 11.—As the result of the wholesale pirating of trade-marked brands of lubricating oils that has been carried on during the past half year, eight separate actions to recover an aggregate amount of \$35,000 as damages, have been filed in the Common Pleas court by J. R. Wilson, representing Charles F. Kellom, a pioneer American refiner of lubricants. Other actions will follow shortly, it being the plan of the plaintiffs to bring suit against all dealers and users, such as supply stores and garages, who have been handling an alleged spurious imitation of the Kellom brand of "Invader" oil. Serious charges of fraud and deception are made against the defendants in a number of the suits, the imitations having been purchased by agents of the plaintiffs in numerous cases in which the dealer guaranteed the oil to be the genuine Invader brand, while the chemist's analysis showed it to be quite the contrary.

Practically all the defendants in the first eight actions are garages. It is commonly reported that several other well-known refiners of lubricating oils find themselves in a similar position where their brands are concerned, small dealers all over the country selling inferior products under their name, refilling their trade-marked cans with cheap oils, and the like.

RUSHMORE OBTAINS FURTHER INJUNCTION.

NEW YORK, May 11.—Following up its policy of obtaining injunctions against lamp manufacturers who are alleged to have been turning out colorable imitations of its designs, the Rushmore Dynamo Works, Plainfield, N. J., recently obtained a favorable decision against the Badger Brass Manufacturing Company, by Judge Lacombe, sitting in the United States Circuit Court for the Southern District of New York. The decision takes the form of an injunction forbidding the defendants to make or sell lamps in colorable imitation of the Rushmore flare front design. The decision is one of a number resulting from litigation instituted in November, 1907, and which has resulted favorably throughout for the complainants. It is especially worthy of note, as the question, at no time, has been one of patents, but of unfair competition, the doctrine involved being that of illegality of competition by means of imitations—something of long standing in England, but one that has not been recognized to any great extent in this country up to within very recently.

LELAND HAD A MINIMUM OF TIRE TROUBLE.

In the course of the story of the Briarcliff race which appeared in THE AUTOMOBILE, it is stated that Leland, one of the Stearns drivers, was delayed to a considerable extent by punctures and other damage to his Pennsylvania tires. When this was called to Leland's attention by the manufacturers, the Pennsylvania Rubber Company, Jeannette, Pa., he stated that his Pennsylvania tires supplied the best performance that he had in his racing experience, having been adopted after previous testing of various tires for this purpose, the dismantlable rims the car was equipped with having been responsible for the delay.

In addition to Leland's statement, F. B. Stearns said that the Pennsylvania tires used in the trials and during the race showed up so well that he was enthusiastic over them. "I have used several sets of these tires beside those used on the racing car and they have been very satisfactory," added Mr. Stearns, "and I am also recommending my friends to use Pennsylvania tires."

NEWARK MAY HAVE AN AUTO FACTORY.

NEWARK, N. J., May 11.—A rumor is current here to the effect that an automobile manufacturing plant is to be established here within the next few months. A two-cycle gasoline car, on which patents are said to be held by a local mechanic, will be built, the first model, which will be a 30-horsepower runabout, being turned out on a small scale. A. H. Newton is said to be back of the concern which is now being organized.

PENNSYLVANIA ENTRANT FOR VANDERBILT.

BRYN MAWE, PA., May 11.—As the result of the continually increasing demand for a very fast semi-racing type of car, the Auto Motor Company, builders of the Pennsylvania cars, have decided to bring out a stock car to be known as the "Vanderbilt" model, and it is also the intention of the makers to enter one of these cars in the Vanderbilt race next fall. The power plant will consist of the valve-in-the-head type of motor that is a distinguishing feature of the Pennsylvania car, its dimensions being 41-4 by 41-4 inches; it will also have the same type of unit axle and transmission. The wheelbase will be 105 inches, and the car will be guaranteed to develop 75 miles an hour.

In addition to the foregoing, this firm is also bringing out a new "Pennsylvania 25," officially known as Type D, which will be a five-passenger touring car or roadster, embodying the same features of construction as the Vanderbilt model referred to, and designed to sell at \$2,250. The first of this model will be on the road in about six weeks and, as a number of orders are already booked for them, shipments will begin about August. The company is now planning a 125 by 281-foot, two-story addition to its plant, which will be devoted to the manufacture of a four-cylinder two-passenger roadster car to sell at \$1,200.

INDIANANS WILL HAVE SEALED BONNET.

INDIANAPOLIS, IND., May 11.—All arrangements have been completed for the sealed bonnet contest to be held under the auspices of the Indianapolis Automobile Trade Association on May 20. However, it has been decided not to divulge the route or conditions until about two days before the contest. George Weidley, of the Premier Motor Manufacturing Company, is chairman of the committee having the event in charge.

HOW OVERLAND CARS ARE COMING THROUGH.

INDIANAPOLIS, IND., May 4.—Since the Overland Automobile Company, of this city, was reorganized last fall, J. N. Willys, of the American Motor Car Sales Company, becoming president; W. H. Brown, of the Pope-Waverly Company, vice-president, and P. D. Stubbs, of the Knox Automobile Company, secretary and treasurer, it has progressed very rapidly, producing more than double the number of cars since March 1 of this year than it did in all its five years' previous existence. The accompanying photograph of the assembling department of the Overland plant serves to give some idea of the rapidity with which the Overlands are now being put through the works, five complete cars being turned out each day. The demand for the Overland has grown so that the company is now considerably behind its orders.

FINAL STANDING HARRISBURG CONTESTANTS.

HARRISBURG, PA., May 11.—At the conclusion of the painstaking and exhaustive examination of the technical committee, it was generally conceded that the endurance run of the Automobile Club of Harrisburg had been conducted in a most thorough and sportsmanlike manner, the sole discordant note being the protest of the Rambler entrant, No. 25, driven by A. H. Bitner, which was penalized 17 points for loose hand brakes, W. F. Smith, the Philadelphia agent of the Rambler, claiming that the penalty was excessive, although Rule 24 bound all entrants to accept the technical committee's findings as absolute. The White in Class A, driven by Walter White, and C. C. Cumbler's Pullman in Class D, were the only all-round clean scorers, each winning two cups.

The appended table shows the penalties imposed in all four classes for both road faults and technical defects:

No.	Car	Driver	Road Penalties	Technical Penalties	Total
CLASS A					
28	White	Walter White	0	0	0
16	Thomas	C. C. Fairman	0	15	15
5	Pullman	Robert Morton	65	0	65
7	Pullman	J. A. Kline	61	60	121
10	Stoddard-Dayton	Robt. Shirk	189	0	189
18	Pierce-Arrow	Arthur Kumpf	0	..	Out
CLASS B					
22	Mitchell	W. M. Cram	0	2	2
19	Maxwell	Chas. Fleming	2	4	6
21	Maxwell	A. Bender	6	19	25
6	Pullman	M. Graupner	30	21	51
23	Cadillac	C. C. Crispen	4	76	80
3	Jackson	Chester Smith	15	..	Out
15	Elmore	A. D. Miller	51	..	Out
CLASS C					
8	Pullman	Stuart Lafean	0	6	6
27	Pennsylvania	L. Fuegel	0	11	11
25	Rambler	A. H. Bitner	0	17	17
17	Apperson	C. J. Swain	13	5	18
4	Pullman	E. G. Irvin	9	56	65
11	Stoddard-Dayton	H. Hodson	0	..	Out
CLASS D					
12	Pullman	C. C. Cumbler	0	0	0
14	Atlas	F. K. Mears	141	15	156
20	Maxwell	J. E. Sellers	146	66	212
24	Ford	A. A. Jones	350	96	446
9	Pullman	C. C. Cocklin	450	29	479
2	Jackson	H. G. Zimmerman	0	..	Out
1	Cadillac	R. H. Hagerling	0	..	Out

Quakerites Also Now Travel in Taxicabs.

PHILADELPHIA, May 11.—Last week witnessed the first indication here of the taxicab fever which is now sweeping over the country. Ten of the Thomas variety arrived in the city, and although they have not yet been put at work, the close of the present week will see them in operation from one of the big hotels. The remaining forty vehicles of the first installment will probably be delivered before the close of the month, which number will be sufficient to make a start.

Capacious Assembly Room of the Factory of the Overland Automobile Company, at Indianapolis.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Dallas, Tex., has opened an automobile school which will be the largest, and, in fact, the only school of that character in the Southwest. J. W. B. Jeffords is president and manager, and W. A. Fosdick, vice-president and treasurer.

The Fairweather Club is to banquet the New York Carnival Committee on June 3. The report of the committee, by the way, will be presented at another dinner, to be given at the Hotel Brevoort on Saturday evening, at which the newspaper men are to be guests of honor.

Although the touring season is hardly under way as yet, the makers of the Elmore two-cycle cars have been agreeably surprised to find that their guarantee of 2,000 miles on one set of dry cells with the Atwater-Kent ignition system now installed on the Elmore, is being greatly exceeded in every case.

The Lockport Rubber Company, Lockport, N. Y., is a new concern organized to manufacture pneumatic tires, inner tubes and sundries in addition to complete lines of rubber goods for other purposes. The officers are Charles F. Kelly, president; J. Edwin Davis, vice-president; H. M. Wood, secretary. The concern is capitalized at \$300,000.

American products have long been making inroads into European commerce, but one of the first cases on record where a foreign war department has gone abroad for part of its equipment is to be seen in the case of the Dutch army, which has decided to equip its entire motorcycle corps with Solar headlights, which is a gratifying victory for the Badger Brass Manufacturing Company, Kenosha, Wis.

One of the buildings of the new plant of the Speedwell Motor Car Company, at Dayton, O., is now about ready for occupancy, while two more of the same size, measuring 30 by 150 feet, are now in course of construction. The working force now numbers about 75 men and orders are being received in such numbers that it has been found necessary to ship the cars by express in order to meet the demand.

The Gearless Motor Car Company, Rochester, N. Y., makers of the Gearless cars, has just been reorganized with the following incorporators: William Bausch, vice-president of the Bausch & Lomb Company; George F. Roth, collector of customs at Rochester; W. H. Rogers, president of the Rochester Tile & Brick Company; John W. Breyfogle, vice-president and treasurer of the Gearless Transmission Company, and John J. McInerney, attorney. The new company will be under the same management as at present and will continue the same plant and offices.

As the result of the various city ordinances in different parts of the country, excluding cars carrying non-skid chains and similar devices from park roads, the Republic Rubber Company has brought out a new tire equipped with what is known as the "Staggard Tread." This consists of five large ribs, which are cut transversely at intervals of an inch so that studs are left about the shape and size of a lozenge, this style of corrugation having the advantage of not working off or pulling loose. As it is entirely of rubber, there is no hardening of the tread of the tire and consequently no loss of resiliency.

A rumor has been current to the effect that John H. Patterson, president of the National Cash Register Company, has been negotiating with Alexander Winton, for the sale of the Cleveland factories of the company, of which Mr. Winton is the head, and that the cash register concern was about to embark in the manufacture of automobiles. Mr. Winton declares the rumor to be without foundation, and Charles B. Shanks, sales manager of the company, says: "I don't think Mr. Patterson, or anybody else, can buy the Winton company. We have been successful in the automobile business since its inception, and the outlook is that we will continue to be a strong factor in the trade."

TRADE CHANGES OF LOCATION.

The Chicago agency of the E. R. Thomas Detroit Company has been removed from the salesrooms of C. A. Coey & Company, on Michigan avenue, to Levy & Fanning, 390-392 Wabash avenue. George W. Hipple, who has been making a marked success in handling the Thomas-Detroit line, will be continued as branch manager. Mr. Hipple has been in charge of the Thomas-Detroit business in Chicago since it was established there last February.

The Swinehart Clincher Tire & Rubber Company's New York office will remove to 875 Seventh avenue June 1. The company has leased a three-story building at the above address and it will be devoted entirely to housing the Swinehart tire interests in New York. A similar building has been leased at 1720 Michigan avenue, Chicago, for the use of that branch and will be occupied July 1. It has been found necessary to secure larger quarters for both branches, owing to the fact that the work could not be handled at the old locations.

NEW AGENCIES ESTABLISHED.

The Percy Ford Company has succeeded Leon Rnbay Company, at 226 Columbus avenue, Boston, and will do a general automobile supply business.

The S. & M. Supply Company is a new concern in the accessory field that has just opened business at 177 Portland street, Boston. A complete line of supplies and accessories of all kinds will be handled.

Bernard F. Goss has been appointed agent for the Atlas Motor Car Company, of Springfield, Mass., at Hartford, Conn., and will handle the Atlas line in that territory. He has established headquarters at 1124 Main street.

With a line already the largest in the city, the Bergdoll Motor Car Company, Philadelphia agents for the Benz, Berliet, Welch, Imperial and Reliance trucks, last week took on two additional agencies, the Rauch & Lang electrics and the Oakland.

C. F. Splidorf, the well-known manufacturer of ignition specialties, has just opened a branch in Chicago. It is established in a well-appointed and commodious quarters at 310 Michigan avenue and a full line of the Splidorf products will be constantly carried in stock for quick delivery. B. P. Houlihan, who for some years has been manager of this firm's branch in San Francisco, and who is well known to the trade throughout the country, will have charge of the new branch.

The interests of the H. W. Johns Manville Company in Detroit and adjacent territory, having increased to an extent where the business can no longer be properly attended to otherwise, a new branch house will be established there. It will be located at 72 Jefferson street, and will be under the management of Willard K. Bush, who has been connected with the Milwaukee branch of the same house for a number of years. Complete stocks will be carried at the new Detroit branch.

An important change in the agency forces along Broadway took place last week in the placing of the Acme line with the new firm of Cordner & Flinn, which has established headquarters at the northeast corner of Seventy-sixth street and Broadway. The concern is a recently-formed partnership between A. B. Cordner, long and favorably known in the life insurance field, and Welton H. Flinn, who has been representing the makers of the Acme in New York for some months past. The agency was formerly with J. B. Brewster & Company.

PERSONAL TRADE MENTION.

R. B. Mann, until recently connected with the White branch in Orange, N. J., has been added to the sales force of the Philadelphia branch of the White Company.

The Hamilton Auto Company, Philadelphia, agents for the Stoddard-Davton, last week secured the services of R. Y. Spare, formerly connected with the sales department of the Thomas agency there.

C. F. Green has acquired the auto top factory of the Automobile Equipment Company, and has severed his connection with that concern, combining his interests with the Motor Specialty Company, 239 Jefferson avenue, Detroit, Mich.

F. M. German, formerly located in Chicago, as western representative of the Standard Roller Bearing Company, has just been appointed sales manager of that concern, with headquarters at the factory in Philadelphia, where he has been located for the past 18 months.

Charles F. Barrett, formerly assistant engineer of the Electric Vehicle Company, Hartford, Conn., has joined the selling forces of the Locomobile Company, Bridgeport, Conn., and for a time, at least, will devote his energies to handling the product of that company in Hartford. Mr. Barrett finished the 1906 Glidden tour with a perfect score in a 24-horsepower Columbia, and won the class event in the Crawford Notch hill-climb.

Ernest H. Brandt, who has been identified with the Corbin Motor Vehicle Corporation, New Britain, Conn., for some time, as sales manager, has just been appointed general eastern manager for the Cadillac Motor Car Company. Eastern in this connection means New York, New England and New Jersey, as well as the cities of Philadelphia, Baltimore and Washington. Headquarters will naturally be in New York City, and it is understood that the salesrooms will be located in the vicinity of the Circle, at Fifty-ninth street. Previous to his connection with the Corbin interests, Mr. Brandt was with the Hartford Rubber Works Company and was associated with E. R. Benson, the new general sales manager of the Cadillac company.

INFORMATION FOR AUTO USERS

Hagstrom Blow Out Patch.—This is a device especially designed for the road repairing of rim cuts and blow outs, that is being placed on the market by the Hagstrom Brothers Manufacturing Company, Lindsburg, Kan. It is in the form of a sleeve and when applied to a tire that has been worn past the danger point, will effectively prevent a blow out. It is made of five layers of high-grade friction fabric and covered with a good quality of rubber, made amply strong to protect a blow out, or rim cut, several inches long. It takes

HOW THE HAGSTROM PATCH IS APPLIED.

the strain off the casing and prevents the tire from bulging out of shape, so that ordinary rim cuts and blow outs can scarcely be noticed, when repaired with the aid of the Hagstrom blow out patch. The patent metal clips are formed longitudinally to correspond with the radius of the shoe, with a tongue bend round the bead of the shoe, making the patch a permanent fixture, thus saving the inner tube when the shoe gives out. They are made to fit all sizes of shoes, and for the clincher, Dunlap and Fisk styles, as well as for all detachable rims. While giving protection to the inner tube, the patch itself is protected by the shoe and may be used any number of times.

Atwater Kent Spark Generator.—The success with which this piece of ignition apparatus has met, particularly in connection with dry cells and other forms of battery, is due to the instantaneous and positive primary contact. The mechanism by which this is accomplished is extremely simple and ingenious, and very positive in

PLAN VIEW, ATWATER KENT CONTACT MAKER.

action. The illustration shows a plan view of this contact maker, the moving parts being the shaft *A*, the snapper *B*, and the pivoted contact arm *C*. The shaft carries four, or for a six-cylinder engine, six milled notches, forming a ratchet which engages the claw at the end of the snapper. The latter is a light piece of tempered steel, which is guided by slots in the bronze base *DE*, and is pulled by the spring *F*, against a spring wire stop *G*, when released from engagement with the notches on the

shaft. The contact arm *C*, is likewise held normally in the position shown, by the tension of the spring *H*. The shaft, turning counter clockwise, draws the snapper into position, and the claw of the snapper, when released, rides up on the rounded part of the shaft, acting thereby as a wedge between it, and the steel hook *I*, of the contact arm, which is pivoted at *J*. The contact arm is thus oscillated to produce contact between a platinum point in the flat copper spring *K*, and the stationary insulated contact screw *L*. A special feature of the peculiar form of contact maker described is the fact that backward rotation produces no spark at all, which is an advantage in connection with a two-cycle motor, to prevent its reversing. The Atwater Kent Spark Generator is made by the Atwater Kent Manufacturing Works, 46 North Sixth street, Philadelphia, Pa.

DETAILS, ATWATER KENT CONTACT MAKER.

Electric Tail Light.—This is a novel electric lamp designed to aid the autoist in carrying out those provisions of the laws to be found in most of the States, which provide that the rear number be illuminated at night. That the average tail lamp falls far short of complying with this requirement may be seen at a glance at the ma-

ELECTRIC TAIL LIGHT FROM BOSTON.

jority of cars. This newcomer is manufactured by Holt & Beebe, 40 Sudbury street, Boston, Mass., and is designed to be attached either to the number plate, or to the body of the car. It is intended to be supplied with the necessary current from the sparking battery of the car. The light is thrown directly on the number and has the great advantage of not being shaken or blown out.

Decarbonizer.—To meet the constantly growing demand for some substance which would remove carbon deposits from the combustion chambers of a motor without the necessity of dismantling it, the General Accumulator & Battery Company, Milwaukee, Wis., has placed a compound known as "Decarbonizer" on the market. It is an oily substance mixed with chemicals that will combine with the carbon, and with the aid of the combustion in the cylinder, which volatilizes it, carries the carbon out

through the exhaust, leaving the piston, rings and cylinder perfectly clean and in a well-lubricated condition. The engine should be hot before using the Decarbonizer, and the oil should be shut off three to five minutes before injecting it, in order that the carbon deposits may be dry and the Decarbonizer soak into them. Two to three ounces should be put in each cylinder and the engine run until excessive smoking ceases. The exhaust valve must be closed when injecting the Decarbonizer or it will be forced out when turning the engine over to start. It will continue to act for hours after, or as long as there is any carbon in the cylinder. The makers guarantee it to be absolutely harmless when used in connection with gas and gasoline engines, also that a thorough cleaning of the working parts can be effected in 15 minutes.

Ackerman Parting Windshield.—This is a new type of windshield manufactured by Joseph N. Smith & Company, Fourth and Porter streets, Detroit, Mich., and which has numerous advantages over the ordinary style. It is designed to be operated from the seat of the car and may be raised or lowered in five seconds, locking securely in either position, and without any possibility of rattling. The top sash is hinged by the upper braces, preventing any

LINE OF THE ACKERMAN WINDSHIELD.

possibility of being detached, or dropping accidentally. It requires but four inches space to operate in and will thus avoid the lamps or steering wheel on any car. The braces are constructed with universal joints and are arranged so that they can be cut to any desired length. There are no projecting arms or handles to mar the beauty of the shield, while the bottom sash is made five inches wide, so as to allow for cutting to fit the shape of the dash without the use of any filler board. This construction reduces the possibility of accident, to a minimum as no metal comes in contact with the glass, the channels across the center being padded to receive it. It is made regularly in 42 and 45-inch widths, special brackets being supplied according to whether the shield is desired for wood or metal dash. The same makers also manufacture coat and foot rails.

"Filler" Tire Repair.—This is a substance designed to repair cuts, punctures, curb injuries, sand blisters and the like, to pneumatic tires, and is being placed on the market by the Greenwald Rubber Company, 31 Church street, Buffalo, N. Y. Neglecting these injuries to a tire allows water and sand to work through the plies and eventually causes the tread to separate from the fabric, thus ruining the tire. It would mean considerable expense and time to remove a tire to have it vulcanized every time it suffered damage of this kind, and the average autoist simply lets it go, thus

making the time when the tire needs re-treading, far shorter than it would be if this damage were tended to in time. To use, it is only necessary to remove all foreign matter from the cut, cleaning it out well with gasoline with the aid of a piece of muslin and a pair of tweezers. A piece of "Filler" of the required size is then forced into the opening and the repair trimmed smooth with the wet blade of a knife.

Whitney Chain Belt.—This is a special type of belt designed to be employed in connection with cooling fans, oilers, for driving motorcycles and also for many purposes in connection with machinery where a high speed round small pulleys is required to be noiseless and positive. As will be apparent from the illustration, the chain is composed of center blocks, rivets and special side links, while a piece of leather of special shape is wrapped round each pair of side links and is held firmly in place by means of a steel plate on the top surface of the leather, the plate being held

DETAILS OF THE WHITNEY CHAIN BELT.

by projections on the side plates of the chain, which pass through the locking plate and are headed over against it. The locking plate has teeth on each side which are imbedded in the leather in order to hold the ends securely together. Nothing but the leather comes in contact with the grooved pulleys, but the chain center makes the belt absolutely flexible, even when running round a pulley of small diameter, and it prevents the belt from stretching. By means of the adjustable pulley, the chain belt may be stretched to the exact tension required without the use of an idler, and also without an adjustment between the centers of the pulleys. The flanges of the adjustable pulley are brought together to tighten the chain and when they are separated, the chain will loosen. An absolutely noiseless and positive drive is insured. Several prominent automobile builders are now trying out the Whitney chain belt on their cars with excellent results.

Slama Tire Protector.—This is a new type of steel tire protector and non-skid device that is being manufactured and marketed by the Slama Tire Protector Company, 609 East Fifteenth street, Kansas

City, Mo. It is made of steel links of special formation, as will be seen by the accompanying illustration showing it in place on a tire, and is complete in one piece, the fastening consisting of a single hook. It is primarily intended for continuous service, only the broad, smooth backs of the

SLAMA TIRE PROTECTOR IN PLACE.

crosses, or links, coming in contact with the rubber of the tread, but it is easily attached or removed and can be rolled into comparatively small compass to stow in the tool box. It is adjustable to fit all makes and sizes of tires.

Palmer Heavy Truck Tire.—This is the invention of H. A. Palmer, Akron, O., who has had a number of years' experience in the manufacture of both solid and pneumatic tires, and is designed to do away with the disadvantages at present existing in the one piece type of solid tire for commercial vehicle use. The new Palmer tire is made in annular sections with transverse holes molded near the base, and in which the cross rods are inserted when the tire is applied. This is shown by the sectional illustration. Between each rubber section, and over, or above, the cross rods, is a circumferential wire ring. On each surface of the side flanges, recesses are provided to engage the cross rods in order to prevent creeping, the circumferential rings, holding the tire in place and preventing any outward movement. While in use under heavy loads, the cross rods move slightly with the rubber, both to and from the wheel base, as well as circumferentially, which prevents the rubber wearing away from the cross rods. To apply the tire, one flange is placed on the wheel and held in position with several felloe bolts; the wheel is then laid flat on trusses, or blocks, with the flange underneath the wheel; a section of rubber is then put on and the cross rods inserted, then a circumferential wire ring and alternate rubber section and wire ring, until the proper width is obtained. The other flange is then placed in position and bolted securely. Should a section or part section become damaged, it may readily be replaced by removing one of the side flanges, the operation being very simple and easy.

Acme Roadster.—This is one of the latest additions to the constantly increasing number of buggy type cars being turned out in the West. It is the product of the Motor Buggy Manufacturing Company, 309 South Third street, Minneapolis, Minn. The power plant consists of a two-cylinder vertical, water-cooled four-cycle motor, of 4 1-2-inch bore by 4-inch stroke, rated at 16 horsepower. Jump spark ignition using batteries is employed, while an option of the Schebler or Heitger carburetors is offered. The radiator is built of brass tubes surrounded with copper fins. The change speed gear is of the planetary type giving two forward speeds and reverse, while the drive is by means of double chains, Hyatt roller-bearings being used on the counter shaft and transmission, while Timken roller-bearings are used on the wheels. The frame is made of 1-4 by 1 3-4-inch angle steel and the body of white wood on oak sills. Speeds of from one to 25 miles an hour are possible as the car only weighs 1,300 pounds. The wheelbase is 86 inches and the tread standard.

The advent of the new Acme Roadster marks a return to the two-cylinder vertical type of four-cycle motor that has been so largely used abroad, but which has come in for comparatively slight attention at the hands of American makers.

Ze-nole.—This is an up-to-date cleaner for auto tops and slip linings, that is manufactured and marketed by F. S. Carr, 74 Pearl street, Boston, Mass. It will remove all spots caused by dust, rain or mud, as well as grease spots, and keeps a top in good shape merely with a few minutes regular attention. It can be freely used, as it has no injurious effect on the rubber compound. Mr. Carr is also an importer of auto top materials and handles a line of domestic fabrics for this purpose in addition. Experience has taught that macintosh material is the most artistic and most practical cloth for this purpose, being made in a wide variety of shades to harmonize with the finish of the car. Complete lines of samples of both foreign and domestic materials will be sent to makers or owners by Mr. Carr on request.

Miller & Starr Grease Gun.—In the description of the "quick acting" grease gun which recently appeared in these columns, the makers, Miller & Starr, call attention to the fact that it was erroneously stated that the gun is filled by removing the cap, whereas it should have been said that this was done by unscrewing the nozzle from the barrel. The barrel should then be pushed into the grease gradually, turning the handle from right to left. The makers further state that it would be impossible to unscrew the cap as directed, without breaking the lugs in it, thus damaging the gun.

CROSS-SECTION—HOW PALMER TIRE IS ASSEMBLED.

THE AUTOMOBILE

ALCOHOL FUEL IN FRENCH INDUSTRIAL VEHICLE TOUR

By W. F. BRADLEY.

PARIS, May 15.—The military element is strong in the industrial vehicle competition, which the Automobile Club of France has put on foot for the fourth year in succession, and which is now being carried out in the north of France. After a couple of days for weighing in and sealing of parts, Sunday was spent in the Galerie des Machines under the gaze of a numerous public. Promptly at 7 o'clock each team was admitted, at intervals of five minutes, to enter the enclosure and take out

make their controls with perfect regularity, speeding to gain time as a reserve for a breakdown being impossible, owing to numerous sub-controls on each of the stages. An innovation in competitions of this nature is that the changing of tires, rims, or wheels is forbidden. Pneumatics are not allowed except in the cab section, and for those vehicles desiring to compete for the military prizes, or to be bought by the army at the end of the competition, the rear wheels must be shod with steel.

Two of the Ponderous Trucks Proceeding on Their Official Way Over the Course Near Bonnieres.

a vehicle, running time being counted from the moment the order was given to enter the parking place. A stop of one minute at the gate of the big hall to allow the military officer to throw up his meager baggage and climb on board, and the car was off for its month's journey.

In addition to covering 1,885 or 2,488 miles, according to the type of vehicle, each competitor must make every control on time, must change none but the parts allowed by the committee, and must finally submit to a fuel test for final classification. There is nothing in the nature of a pleasure excursion in this competition, the vehicles being required to carry their full load for one month, a condition never demanded in actual work, and to

Gasoline is the fuel used by all the trucks, but all those competing for the army prizes must be capable of running on alcohol, and must, on the last stage of the journey, cover a distance of approximately 100 miles with this fuel. The club regulations under which all cars finishing the regularity test must submit to a final fuel test, leaves the choice of fuel to the individual constructor, on condition that he makes known his choice fifteen days in advance.

Vehicles Must be Capable of Service Without Rubber Tires.

Compared with previous years, the thirty-four trucks and eleven cabs taking part in the two competitions are a specially

good set. There are practically no cases of touring car chassis fitted with special bodies and strengthened in a few features, but in almost every case the vehicles are specially designed and studied for the work they have to perform. One of the most significant features of the competition is that neither wheels nor tires can be changed, and that, to meet the military requirements, the rear wheels must be steel shod. For the commercial vehicle to become a serious factor in the field which it seeks to occupy, it is imperative that the hitherto enormous expense attending the use of pneumatic or rubber tires must be reduced in no small proportion. In previous competitions, wheels and tires have been the weakest point in all the vehicles, the number of those showing economical results in these two features being very small. The new regulation has had as a first result the more serious attention to suspension. Not only are the springs better adapted to the work they have to perform, but they are on 90 per cent. of the vehicles supplemented with hydraulic or other types of shock absorbers, fitted with grease caps, and have all joints that are securely protected by good leather casing.

For the three lower categories in the light-weight class, the maximum load of which is 3,300 pounds, solid tires front and rear are invariably employed. A couple of tricars for quick delivery service, fitted with a special type of cushion tire cannot be considered as an exception. Where loads of more than 3,300 pounds are carried, the majority of the competitors have adopted metal-shod wheels for the rear and solid rubber tires in front, in accordance with the military requirements. It is a foregone conclusion that a certain number of these will be unable to come through the test, the suspension being manifestly inadequate for steel rims. An insignificant proportion have ignored the military conditions and fitted solid rubber tires in the rear. In consequence of the general use of steel tires, a large proportion of the competitors in the heavier classes have fitted sand boxes automatically laying a trail of sand before the rear wheels at the will of the driver.

In the two classes of passenger vehicles, the lower one, with provision for 6 to 10, and the higher for more than 10 persons, excluding the driver, solid rubber tires both front and rear are found on every vehicle, one or two employing twin tires for the rear.

Mechanically considered, there is a certain similarity in the French vehicles engaged in the trials. There are all the differences one would expect to find among a group of vehicles varying from one-lungers of 3.3 by 3.5 bore and stroke to powerful four-cylinder of 5.6 square; but general lines of construction are observed throughout the different classes. There is not a single steamer in the competition, the only two firms of importance in France devoted to this class of automobile having refused to engage cars. Without exception, the engines are vertical and water-cooled, the pump being employed on all but a three-ton Berliet and Cohendet. Ignition by high-tension magnetos is in the majority, the low-tension type being employed on not more than 20 per cent. of the cars. Transmission in all cases is by sliding gear, but clutch and drive show a diversity of systems.

Though final drive by side chains is general in the heavier vehicles, there are a small number of vehicles with cardan shaft and double rear axle of the De Dion type. Direct drive on both third and fourth speed is reserved to the numerous Ber-

liet vehicles. Panhard and Saurer, the Swiss commercial vehicle constructor, use the engine for braking by means of a camshaft movable at will.

Taxicabs to Cover 2,500 Miles on Alcohol Only.

Particular interest attaches to the taxicabs from the fact that it is the first time vehicles of this nature have been put to a severe public test, and also on account of the use of alcohol as fuel for a journey of nearly 2,500 miles. There are five 4-cylinder engines, the average dimensions of which are 2.9 by 4.7 bore and stroke; three 2-cylinder cars and a solitary one-lunger. Excepting a couple of Brasiers, all the cabs have high tension-magneto only, storage batteries not being carried. Thermo-syphon and mechanical water circulation are in the proportion of six to five. The classic leather face cone clutch is supreme, being fitted to all but one of the competing cars. Cardan shaft is employed without exception, but there is no uniformity in the type of gear boxes or their position, some of the makers uniting it with the differential on the rear axle, and others carrying it in the more general position between the engine

Where Cars Were Weighed In, Sealed, and Started on Their Long Journey.

and the shaft. With tires, and complete with closed body, lanterns, and all accessories, the price of the taxicabs varies from \$1,200 for the 9-horsepower one-lunger to \$1,700 for the 12-horsepower four-cylinder Vinot. Bayard-Clement turns out a two-cylinder at \$1,200 complete, and two other firms with a good reputation produce a four-cylinder cab at \$1,600.

Minister of War Will Buy at Tour's Conclusion.

The Minister of War has sent an official delegation to follow the vehicles in their wanderings, and has announced his intention of buying some of the most successful automobiles at the end of the competition, in accordance with a now well-established practice. The Russian military department has also sent an official delegation and will purchase thirty trucks for army transport service.

The order of travel has been modeled somewhat on the lines of that adopted in the very successful English commercial vehicle trials of last year. Starting from Paris, the procession will first make its way to Rouen, two different routes being adopted, a shorter one for the slow-moving wagons, and a more circuitous one for the fast-moving vehicles. Rouen, Amiens, Lille, Reims, Nancy and Dijon, all being towns of considerable commercial importance, will be encircled by the competing vehicles in such

a way that the cars will pass from two to four nights in these centers and give the inhabitants an opportunity of closely inspecting them. Throughout the month's run the slow vehicles will shortly be given the shortest distance from point to point, but the meeting place every evening will be the same for all.

Types That Are Engaged in Competition.

Only one of the classes provided by the technical committee failed to draw entries, that for automobile trains of the Renard type in France, and the Alden-Sampson in America. In the light class reserved to vehicles carrying from 110 to 440 pounds the three entries consist of a couple of Contal tricar and a Werner light delivery vehicle. Panhard and Peugeot are alone with one vehicle each in the second category, while the third class is limited to three cars supplied by Panhard, Brouhot, and Dietrich. A better show is made in the 3,300 to 4,400 pound class, where there are two Berliets, two Peugeots, a De Dion and a Vinot. In the fifth class for vehicles carrying a load of 4,400 to 6,600 pounds, Berliet again has two vehicles, and Saurer, Panhard, and De Dion one each. There is the best representation in the sixth class for trucks transporting loads of more than three tons, the entries being two front-drive Latil trucks, two Cohendets, two De Dions, two Berliets, a Dietrich, a Saurer, and an Espine, Achard & Co.

Two classes are provided for light omnibuses intended to be used for hotel service, for holiday resorts, or for surface car feeders, where the number of passengers will be relatively small and rate of travel high. Six vehicles capable of carrying from six to ten passengers are supplied by Berliet, Peugeot, De Dion and Dietrich. The last class for omnibus carrying more than ten passengers has united but two engagements, one from Dietrich, the other from Saurer.

Chief Interest in Taxicab Section.

Undoubtedly the chief interest of the test lies in the taxicab section organized for the first time in France. In adopting alcohol as the fuel for these small vehicles the organizers have doubtless had in view local conditions, alcohol being slightly more advantageous in the city of Paris than gasoline, owing to the town duty on the latter.

Two cab classes are provided, one for small vehicles with a single-cylinder engine of not more than 3.9 inch bore and a minimum weight of 2,200 pounds, and the other for four-cylinder engines of 3.1 inch bore weighing 3,300 pounds. The former are intended to carry two passengers only, without baggage, and to prove a direct rival of the light horse cabs of Paris. In the larger class four passengers have to be provided for and some space given for baggage, this section being intended to encourage cabs for railroad and hotel work, with passengers always accompanied by a certain amount of baggage.

All essential parts of the cars were sealed before leaving Paris, so that no parts can be changed without the knowledge of the official observer on board. Each night vehicles will be stored in a closed garage or open park protected by the police or troops, so that no changes can be made surreptitiously, and at the end of the run, just before entering Paris again, a fuel consumption test will be held.

EFFECT OF SHADE TREES ON FRENCH ROADS.

In answer to inquiries from the United States, Consul-General Robert P. Skinner, of Marseille, furnishes the following information relative to the effect of wayside trees on French roads:

"It is proposed to plant trees along the roadsides of New York State in order to keep the moisture in the road and prevent raveling, and the question has been raised whether or not the roots of such trees may spread out underneath the road surface, and eventually create great damage in a severe climate where there are extremes of heat and cold. While French roads are not always bordered with shade trees, they are so very frequently, and my information is that the trees are planted not only for furnishing shade, but in order to protect the roads themselves against the effects of excessive heat and drought. It is believed that the long, dry summer season is much more inimical

Brouhot Taxicab on the Road Near d'Abbeyville.

to roads than severe cold. The chief officer in charge of the public roads in Marseille is of the opinion that, on the whole, New York roads would be benefited if bordered with trees, suggesting, however, that only such should be planted as have vertically descending roots."

FLYERS DO NOT LIKE ENTRY FEE TAX.

PARIS, May 15.—Aeronauts are not pleased at being obliged to pay an entry fee of \$10 twenty-four hours in advance of each attempt to win one of the many flying prizes. If the prize is won the fee is returned, but if for any cause whatever the aeronaut falls short the money is retained. Delagrangé, Farman and others ask that when rain, wind, or other natural causes prevent a flight, the engagement fee should be returned.

Berliet Omnibus Completing Its Road Test.

PARIS BOULEVARD PROVES ROAD-WEARING ECONOMY OF AUTO

PARIS, May 14.—It is doubtful if Paris possesses more automobiles than New York or London, but there is no doubt whatever that the western portions of the French capital have a more intense automobile circulation than any city in the world. It was hardly necessary to search for official figures to be convinced that in the richer residential quarters of the city automobiles are almost as numerous as horse-drawn vehicles. But the Paris police have gone into the subject, and have compiled an official table, the accuracy of which cannot be doubted, showing to what extent traffic has increased since 1881, and what proportion the automobile holds in street circulation. It will be seen that the proportion is nearly equal.

At four different spots in the city policemen were stationed from 3 to 7 in the afternoon of seven consecutive days with a mission to count the number of vehicles passing their post. On a Saturday afternoon in February the following figures were obtained in the Avenue des Champs-Elysées, the main artery of Paris, and one forbidden to surface cars and heavy commercial vehicles, so that the statistics refer particularly to pleasure cars:

Automobiles	3,430
Various horse vehicles	3,695
Automobile 'buses	34
Horse 'buses	81
Total	7,240

Horses are thus still in a majority, even in the most favored quarter of Paris, though the difference is so small that it is safe to prophesy a change in favor of the automobile at no distant date. The figures were not taken at a time when automobile traction is at its greatest intensity, a cold, damp Saturday afternoon in February not being the day when the maximum of pleasure vehicles are on the streets. Had the census being taken in early June, when Paris is invaded by its thousands of pleasure-seeking visitors, there is no doubt that the horse would have shown a decided minority.

Owing to the intense automobile traffic of the Champs-Elysées, the Paris Police a year ago issued a new regulation, dividing the four-footed traction from the horseless variety. The Champs-Elysées is divided into three distinct channels by reason of a double row of electric light standards and refuges at frequent intervals. The central avenue, between the refuges, is now reserved exclusively to both up and down-going automobiles, the two sides are sacred to the horse, the bicycle, the push cart and other slow modes of locomotion, one side being for up and the other for down traffic.

More benefits have accrued from the innovation than were ever thought possible by Prefect of Police Lepine. The pleasure of driving in an avenue from which all slower modes of traffic are barred can only be fully realized by those who have attempted to wade their tortuous way through the miscellaneous and crowded streets of the city and have then entered into the automobile row of the Champs-Elysées. A very much higher speed is maintained than is possible on the two side sections, yet accidents are fewer than among the horses, and the congestion of the avenue is considerably relieved.

A unique comparison is made possible in the wear on roadway under horse and automobile traffic. For twelve months horses have had exclusive use of the two sides of the wood-paved Champs-Elysées, and for the same period the automobile has run up and down the central channel. The only apparent change in this latter is that from a dark brown color it has changed to black. The horse section, on the other hand, has retained its primitive color, but has sunk irregularly and become pitted in a thousand places under the influence of steel-shod hoofs. No better example could be found

of the economy in road wear possible by the use of the automobile. The municipality of Paris would do well to divide the macadam-built Avenue du Bois de Boulogne in the same way, in order to prove whether the results on wood would be the same on macadam.

A striking feature of the automobile section of the Champs-Elysées is that the road is not blackened equally, but in two broad lines, the right-hand or up section being very much darker than the down line. The reason for this is doubtless that the avenue is on a slight grade, and drivers of cars generally accelerate and give a little more oil than when running on the level. On the down side the engines are run with very little gas and the minimum of oil, and there is also rather less friction at the wheels. The difference between the two sides is so great as to immediately arrest the attention of anyone seeing it for the first time.

According to official returns, there are 40,000 autos in use in the whole of France, 7,670 belonging to Paris and the Department of the Seine. In this case, however, official figures are misleading, the actual number being very close to 10,000. The large companies possess 1,550 automobile taxicabs, small liverymen are responsible for 398 of the same class of vehicle, the private automobiles in use in the city are generally estimated at 7,000, thus giving a total of 9,835. This does not take into consideration the auto-buses run by the municipality, and now numbering about 100, nor the commercial automobiles.

The Imposing Arc de Triomphe.

How the Traffic is Regulated on the Champs-Elysées.

A Fine Macadam Stretch and a Good Illustration of the Scenic Connecticut Country Traversed in the Endurance Run.

CONNECTICUT ENDURANCE RUN HAD PERFECT SCORES

HARTFORD, CONN., May 16.—The initial endurance run of the Automobile Club of Hartford was a most successful consummation, viewed from every standpoint. It is doubtful if ever a club committee worked harder for the good of a common cause. Other cities than Hartford were well represented—even Massachusetts sent down a few cars.

All day long, and to-night, in the immediate vicinity of the club quarters in the Allyn House, there were muffled roars of occasional cars running in without a muffler or making use of the cut-out, which, by the way, is not as yet a serious offense in the capital city of the Nutmeg State. Positions in the event were drawn for on Thursday evening. Friday bespoke of rain, but to-day was ushered in with blue sky and sunshine. Long before the time for the official start, the cars lined up along Trumbull street, and as the whistles tooted the advent of another working day the first car went its way amid a din of applause. The remaining cars were sent away at two-minute intervals, and they literally had to pass down a long lane of spectators to the turning point at Trumbull street, where the local police kept the road clear.

Who They Were and How They Got Away.

To Robert R. Ashwell, in a Franklin, went the distinction of being No. 1, and to Philip Corbin, Jr., went position No. 2, his car being a little air-cooled Corbin. Joe Matson was third, in another car of the same make, and Louis Elmer crossed the line in a little Ford four-cylinder runabout. Pete Robinson, in a six-cylinder Stevens-Duryca, was fifth, and R. L. Lockwood was the next to get away in the 18-horsepower Reo runabout. Harry Tuttle, of New Haven, was next in line, with a 15-horsepower Stoddard-Dayton runabout.

V. A. Charles, the Bostonian from the Rambler branch "along the row," was next in a 32-horsepower Rambler. F. E. Bowers, of New Haven, started tenth, in another Rambler runabout of 40-horsepower, and he was followed by still another car of the same make, driven by Harry Turrell, of Waterbury. S. A. Miner, the local Knox representative, was the next to start, and was followed by his son, Bob, in the little two-cylinder Buick, and the junior member of the family was somewhat wary for

the reason that he drove under No. 13. As a matter of course, he carried a horseshoe over the muffler, also the number "13" in large nickel letters. A. Lazarro, Jr., started fourteenth, in the three-cylinder Compound, followed by C. M. Wright, in the Stoddard-Dayton.

F. W. Dart, a member of the contest committee, was the next starter, and, in order that he might participate with a free conscience, he resigned two days before the contest. To him went one of the hardest pieces of luck of the entire day, for just as he received the word go he accidentally stalled his motor. The car had barely passed over the line, but was penalized one point. He drove a 48-horsepower Thomas Flyer, and carried about the largest number of passengers of any car in the run, and lost not a point throughout the contest thereafter.

The 22-horsepower Overland was the next starter, driven by the local agent, A. W. Peard. S. W. Hancock was another of the Bay Staters who journeyed down to Connecticut looking for glory, and he got it, as later statements prove. G. W. Bennett, of the New York White branch, was the next, with a White steamer. He went his way in good order, made a good showing along the road to the next control, but was penalized for arrival ahead of schedule time. Frank Dunnell, another New Yorker, followed the departed ones in a Ford "Six," followed in turn by B. F. Smith, the local representative of the Mitchell, in a 35-horsepower car of that make. S. E. Campbell, of New Haven, another of the Rambler contingent, faced the starter, and, at the word "go," drove peacefully along the way to a good score.

Hal K. Sheridan, who was regarded as one of the likeliest in the contest, was next in order in the White steamer, but Hal, through no fault of his own, was a victim of fate, like many another, before the day was done. Harold Green was next in order, with D. J. Post's Pope-Hartford, followed by Ariel Mielson, in a four-cylinder Cadillac, another victim of fate. Dean Rankin drove A. E. Bradley's Peerless runabout, followed by C. P. Hulst, in an Oldsmobile of 36-horsepower. T. F. Garvan came next, in another 30-horsepower Pope-Hartford. J. F. Corbett, of New Britain, was next, in a Corbin of 24-horsepower. J. W. Lynch drove a 30-horsepower Knox, followed two minutes later by Stanley Goss, of New Britain, in a

Two-cycle Atlas Nearing Top of Plymouth Hill.

Corbin. John Coffey was the next starter, in C. D. Alton's 29-horsepower Columbia runabout.

A Thomas-Detroit, driven by Oliver Light, followed, and J. B. Burrall left on time in a Packard "30," one of the most consistent running cars in the contest. John Leitz came next, in the smallest car in the event, the single-cylinder Cadillac, made the first round without a tremor, and in all of the second but about ten miles, was pursued by a streak of hard luck that put it hopelessly out of the honor class. Another six-cylinder car, W. H. Hall's Pierce runabout, driven by D. C. Lull, was next, followed by A. B. Barkman, of Tarrytown, in a 24-horsepower Maxwell.

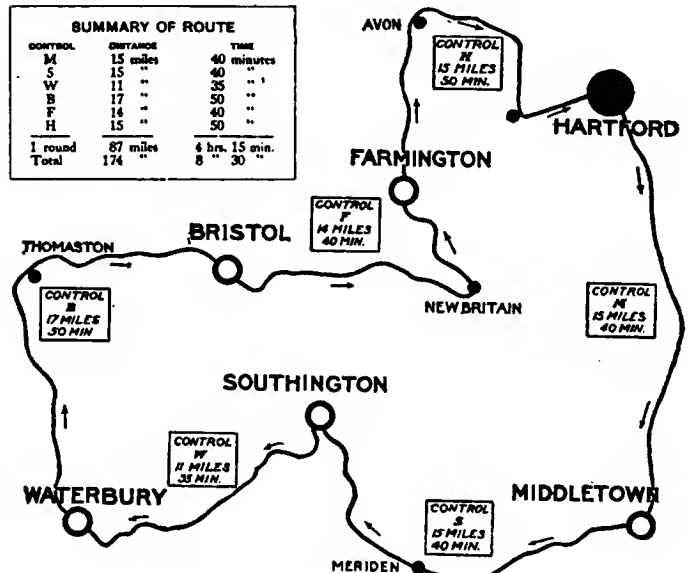

President J. D. Anderson, of the Hartford Rubber Works Company, was next in order, in a Thomas Flyer, which carried a full load of jolly passengers, bent on getting all the fun there was to be had in the 174-mile joy ride. Another consistent car was the two-cycle 22-horsepower Atlas, driven by F. W. Ruggles. William Burr, who is remembered as a factor in the club hill-climb of last September, was in evidence in a 30-horsepower Knox.

The Hon. H. R. Coffin, a free bridge advocate for the towns along the Connecticut where one now pays toll, drove his own 45-horsepower Columbia, and did the trick to perfection. Another Mitchell, driven by Frank Zerbes, trailed the Columbia, to be followed in turn by Claude Pinney, of Stafford Springs, in a 28-horsepower Maxwell. J. M. Macdonald, a local driver, handled the two-cylinder Maxwell in next position, and was

followed by F. W. Belcher, in the 40-horsepower Locomobile of the Fisk Rubber Company. The last in the long line was Gregory S. Bryan, of Bridgeport, in a 36-horsepower Oldsmobile runabout.

Some of the Troubles That Spoiled Scores.

Before the last car had started, news of the forerunners was coming in, and it was learned that G. W. Bennett had been penalized in the White steamer as above mentioned. The Reo had trouble with gears and withdrew, and the Compound was unheard of after Middletown. Truly this contest had the claim to the term endurance, for the cars had no small problem to gain their perfect score. With all the cars under way, the Hartford control took things easy, and prepared for the arrival after the first round. Promptly on time, Bob Ashwell, in the Franklin, came around the corner at a stiff gait, only to suffer a blow-out, which cost him eight points, thereby killing his chances of a perfect score. The remaining cars trooped in, one after another, with now and then one back out of place. The Overland had radiator and tire troubles; Hal Sheridan ran shy on water, and paid the cost; Bob Miner, in the two-cylinder Buick, found it necessary to look at a spark plug, and was

Map of Route of Hartford Endurance Run.

therefore taxed two points. Compound was out of the running, and failed to appear, but the Stevens light "Six," driven by Hancock, came in clean.

No. 22, Mitchell, was disqualified at the Farmington control for running in ahead of time, but continued under protest, to later capture the coveted clean score for the entire run. No. 27, Peerless, had clutch troubles, and tires were troublesome. No. 29, Olds, had tire trouble, and reported accordingly. No. 30, Pope-Hartford, came in on a clean slate; so did No. 31, Corbin. Tires caused all the damage to the chances of No. 12, Knox, for a clean score, and No. 32 was in the same boat. No. 34, Columbia runabout, had ignition troubles on the first control, but ran otherwise clean. On the second round it came to grief. The big Columbia came home clean, but after crossing the line the radiator connections were found to be in bad shape, and one point was checked up because of the attention accordingly bestowed. No. 35, Thomas-Detroit; No. 36, Packard; No. 38, Pierce "Six"; No. 37, single-cylinder Cadillac; No. 39, Maxwell, and No. 40, Thomas Flyer, came in with clean slates. No. 41, Atlas, had slight troubles of the tire description, but No. 42, Knox, came in clear. No. 44, Mitchell, suffered five points, but No. 46 and No. 47, the four and two cylinder Maxwells, respectively, came in clean. No. 48, Locomobile, had a puncture, and to replace a new tire took just a shade more than three minutes, which is going some, and cost four points. No. 49,

Perfect Score Rambler Checking at Hartford Control.

Buick, came home with colors flying and a clean score. No. 50, Olds roadster, had a hard session with tires, and came in to the Hartford control later, and was withdrawn. Out of the 47 cars started, the showing thus far was very good.

That Demand for a Hard Run.

There had been a big demand for a hard run, and it was given, but the cars stood the racket in good shape. After checking out at the Hartford control, a new observer was placed upon each car, and the oil, water, and gasoline supplies replenished.

All the cars reaching Hartford went away over the second lap in good order. As the time for the arrival of the first car approached, the throng once more lined the street, and were soon rewarded by the appearance of No. 1, Franklin, it having maintained that position throughout the contest. Some who went through the first round safely, as in the case of the Cadillac single-cylinder, were hard hit in the final lap. Ariel Mitchelson, Cadillac, 30-horsepower, arrived at a control before he was due, and was disqualified, so put about for home. The final arrival of cars was more or less of a straggling nature. But there is an end to all things, and soon all cars were present or accounted for.

The committee took a short rest, and announced that the results would be forthcoming in a short time. In the meantime, dinner was awaiting the workers who made this affair notable and a success. Then the observers were gathered together in the large dining hall of the Allyn House, and, after due deliberation, that body voted that the G. K. Dustin observers' cup be awarded to the 18-horsepower Maxwell two-cylinder for the most consistent performance.

Chairman Maxim announced that the following cars had perfect scores:

- | | |
|--------------------------------------|---------------------------|
| No. 3 Corbin | No. 33 Corbin |
| No. 5 Stevens-Duryea
(light six) | No. 35 Thomas Detroit |
| No. 8 Rambler | No. 36 Packard "30" |
| No. 11 Rambler | No. 38 Pierce Arrow (six) |
| No. 15 Stoddard-Dayton | No. 39 Maxwell |
| No. 19 Stevens-Duryea
(light six) | No. 40 Thomas Flyer. |
| No. 21 Ford (six) | No. 42 Knox |
| No. 22 Mitchell | No. 46 Maxwell |
| | No. 47 Maxwell |
| | No. 49 Buick |

Ford Checking In at Country Club, Farmington Control.

Thus out of 47 starters there were 18 perfect score cars, which was rather surprising, for it assuredly was a hard test.

Winners of the Gasoline Economy Test.

If entrants so desired, they could participate in the gasoline economy test. The official award gave to the No. 5 Stevens-Duryea (light "six") the honors in the class for cars costing above \$3,000, "Pete" Robinson being the driver. This car traveled the 174 miles with 11 1-2 gallons.

No. 42 Knox, using 8 1-2 gallons, was the most economical of the cars costing from \$1,500 to \$3,000.

While Louis Elmer's four-cylinder Ford runabout, using 9 gallons 3 quarts, is the probable winner of the class of cars selling at less than \$1,500, a protest which the committee has not yet passed upon has been filed by No. 44 Mitchell.

The Hartford Rubber Works trophy for perfect score cars costing under \$1,500 goes to the two-cylinder 14-horsepower Maxim runabout.

A feature of the contest was the fact that all six-cylinder cars entered had perfect scores.

H. K. Sheridan's White Steamer on Top of Southington Mountain—"In the Shade of the Old Apple Tree."

ALGONQUIN CLIMB POSTPONED AUGUST 14.

CHICAGO, May 19.—The third annual hill-climb of the Chicago Motor Club, scheduled for last Friday at Algonquin, Ill., then postponed to Saturday, and again until to-day, because of adverse weather conditions, finally has been postponed until August 14, when the original card will be put on. Efforts on the part of the club to pull off the event were strenuous. Rain last Thursday caused the first postponement, and Saturday morning, despite the fact it looked like rain, the club tried again, this time getting partly through program. Motorcycle events on Perry Hill run off, and automobile card had been tackled, contestants in the third class being sent up the hill when rain came in torrents. Then postponement taken until to-day, with the understanding if the weather was bad affair would go over until August. There was no change to-day, so every one came home.

Part of card that was contested Saturday showed climb would be record-breaking affair, for nearly all cars improved on last year's time, and Perry Hill record was cracked by G. F. Sulzberger, amateur, in a Stearns Six, who went up in 25 2-4, as against previous best of 26 1-5. Sulzberger was allowed to make his climb between Classes A and B, so he could strip car for free-for-all. In Class A, for motor buggies, No. 5, Klinger, led in percentage, although Bendix, four-cylinder rig, made fastest time—46 2-5. In Class B, for cars, piston area under 50 square inches, Moline made fastest time—37 2-5—while the Brush run-about led in percentage. Three cars had gone up in Class C for cars from 50 to 65 square inches, Wayne, Haynes and Moline. Last-named led in time as well as percentage, scrambling up in 32 2-5.

There were eighty entries in the climb, which is claimed as the world's record, as it exceeded seventy of Fort George and sixty-seven in the last Gaillon hill-climb in France.

FOR A RACE TO THE PACIFIC AND BACK.

The New York Times, the promoter of the American end of the present New York to Paris contest, now proposes an across-the-continent-and-back endurance stock car race. The idea received much initial encouragement at a meeting of makers, importers and dealers, and some others high up in the sport and industry, held last Friday evening, May 14. In fact, the meeting resulted in the appointment of Jefferson deMont Thompson, A. R. Pardington, and Robert Lee Morrell as a special committee, to suggest rules for the contest.

It is proposed to start the race on August 15, and run it to the Pacific Coast, returning by a different route, so that as many big cities and as much varied territory as possible may be covered. The Times will enlist the cooperation of other papers.

ISOTTA VICTORIOUS IN TARGA FLORIO.

MILAN, May 18.—Trucco, in an Isotta Fraschini 40-horsepower car, came in victorious in the postponed Targa Florio race, which was put over from last week, owing to a landslide at a point on the course. Fourteen competitors, running in the interest of as many representative European builders, were sent away over the picturesque course in Sicily, but Trucco's victory was decisive, coming in 13 minutes ahead of Lancia, who was second in a Fiat, and making an average speed of close to 75 miles an hour. The car was the same machine in which Trucco won the stock car race over the Padova Bolanenta circuit.

A LAW OF INTEREST TO GARAGE KEEPERS.

ALBANY, N. Y., May 19.—Governor Hughes has signed the Weimert bill, amending the lien law in a manner satisfactory to the owners and keepers of motor vehicle garages. It provides that a person keeping a garage or place for the storage, maintenance, keeping, or repair of motor vehicles, as defined by the Motor Vehicle law, and who in connection therewith stores, maintains, keeps, or repairs motor vehicles, or furnishes gasoline or other supplies therefor, with the consent of the owner, has a lien upon such motor vehicle for sums due, and may detain it when lawfully in his possession until such sum is paid.

ENTRIES FOR JAMAICA CLOSE ON JUNE 1.

From entries already received and the large number of applications for entry blanks being made, indications point to a big field of contenders in the straightaway trials, to be run on Hill-side avenue, Jamaica, Saturday, June 5, under the joint auspices of the Subway Celebration Committee and the Long Island Automobile Club. There will be nine events at each of the following distances: Kilometer, mile, and two miles. Entries will close with Fred J. Wagner, assistant secretary, 29 West Forty-second street, New York, June 1.

STEARNS TO MAKE A TOWN CAR.

CLEVELAND, May 18.—Within the next six weeks, or two months at the outside, the F. B. Stearns Company will place a new model on the market, to be known as a "town car." The new car will be rated at about 30-horsepower (figured on the Stearns rating of sixty), and will be equipped with shaft drive, being the first machine so constructed to be built by the Stearns Company. It will have a three-speed selective transmission and will doubtless be a candidate for honors in the apparently limitless taxicab field once it reaches the market.

AUTOMOBILE CLUTCHES AND THEIR DESIGN*

BY HENRY SOUTHER, MEMBER A. S. M. E. AND S. A. E.

IN *La France Automobile* I find reference to an unusual arrangement of springs under the leather of a cone clutch. Not that the use of springs for this purpose is anything out of the ordinary, but their location and arrangement are quite unique. These are shown plainly by Fig. 20. It is apparent that the metal of the cone is entirely cut away for a short section, admitting a flat spring not more than an inch wide. The unusual feature is the use of a pair of spiral springs supporting the two ends of the more or less flexible flat spring.

Fig. 20—Spring arrangement of cone clutch.

In some instances rubber buffers have been used under the leather in place of springs. The other frictional surface bearing against the leather is, as a rule, a cast iron flywheel.

It is obvious that the construction surrounding the clutch must be such that by no means can an unusual supply of lubricant find its way to the frictional surfaces of the clutch. The flywheel prevents any oil from the engine working its way back, being provided with oil trap grooves for that purpose, if necessary. From the other direction, the gear box, for example, oil ordinarily does not get as far as the clutch. There is usually a considerable space between the clutch and gear box. In general, it may be stated that the cone clutch is as free from variations due to lubricants as any other. The leather surfaces gradually become dry and hard, requiring the application of castor or neats-foot oil preferably, but not very often.

With proper usage, cone clutches with leather faces seem to last indefinitely. I have accurate knowledge of cars that have surely been driven 20,000 or 30,000 miles without replacement of leather on the cone face. My own experience is confirmatory of this. I have driven several cars with cone clutches and have yet to experience any trouble from the wearing of the leather face. I recently saw a clutch that had been used for about 2,500 miles by me that gave no evidence of wear, neither had it received any attention on my part, except to dose it a few times with neatsfoot oil.

There is one defect in the operation of the cone clutch that has caused considerable trouble. The clutch necessarily requires

Fig. 21—Standard type cone clutch.

Fig. 22—Variation of the conical type.

some end or axial motion and a slip-joint that will permit it. An ordinary square slip-shaft has been commonly used. Instances have been found where these square slip-shafts have jammed under load and seized, so as to refuse to permit of the disengage-

ment of the clutch at critical moments. This is a very serious objection, and one that has not been altogether satisfactorily overcome. Improved materials, increased dimensions and better facilities for lubrication have cured much of the trouble. Generous feathers and splines have been resorted to, which present working surfaces that are normal to each other and which avoid any cam-like or wedging action which may exist with a square shaft bearing in a reasonably easy fitting square hole. Here, again, the perfect freedom introduced by double universal joints plays an important part, the square shaft being very much less apt to bind when perfectly free to center itself.

There has been a considerable variety of opinion as to the proper cone angle. Various authorities have placed it all the way

Fig. 23—Method of mounting and control of cone clutch on an auto.

from 7 degrees to 20 degrees. The French have settled down on an 8 degree to 9 degree angle as being about right for a leather-faced cone. Several important American makers are using 12 to 13 degrees, several 10 degrees, and others 8 degrees.

The following table gives the dimensions for cone clutches used on three different models which are probably as successful as any:

Area of flywheel.....	113.1 sq. in.	78.7 sq. in.	73.59 sq. in.
Angle (one side).....	8 deg.	8 deg.	8 deg.
Radius (maximum).....	8 1-2 in.	8 1-8 in.	7 5-8 in.
Spring pressure.....	375 lb.	320 lb.	250 lb.

Horsepower by A. L. A. M.

formula.....	48	42	40
--------------	----	----	----

The metal-to-metal cone clutch is a good one. It may be made smaller in diameter and with a sharper angle, say, 7 degrees, without seizing. It may be used in connection with copious lubrication. This form has been and is used only to a small extent. The dividing line between slipping and seizing is narrow. Another form of cone clutch has an aluminum male member of about 12 degrees angle bearing against cast iron and with cork inserts in the face of the male member. This clutch is not easily affected by a lubricant and, in fact, may be run with copious lubrication. This type has not been widely enough used yet to give sufficient knowledge as to the possibility of general application under many varying conditions.

Up to this time I have referred entirely to what may be called a direct-acting cone, one where the male part of the cone moves axially towards the engine. This is well illustrated by Fig. 21, which is about the simplest form of leather-faced cone clutch. Modifications of this are many, Fig. 22 showing a clutch of the same principle, but in place of having one strong actuating

*Paper read before the American Society of Mechanical Engineers at New York, May 12. Discussion to be continued at Detroit, June 25-28. In conjunction with the Society of Automobile Engineers. Continued from page 672, "The Automobile," May 14.

Fig. 24—Small dimensions of clutch on a 30-horsepower car.

spring surrounding its axis, it has three weaker spiral springs nearer the periphery of the male member. Fig. 23 is a clutch used for a 50-horsepower car, with a cone angle of 13 degrees, a diameter of about 16 inches, a total frictional area of about 128 square inches, and axial pressure of 375 pounds resulting from spring. This cut clearly shows a small spiral plunger spring, *A*, underneath the leather face, *B*, to make it pick up its load more quietly and smoothly. This cut also shows a form of slip-joint back of the clutch, *C*, which, although it does fairly good work, is not on the whole as satisfactory as the double-toggle universal joint. It will be noticed that the arms of this joint have been spread as widely as possible, but, at the best, the pressure and binding action is considerable.

Striking Extremes in Cone Clutch Dimensions.

In direct contrast to this clutch is the one shown in Fig. 24, where the diameter of the cone is very much less, not to exceed 10 inches. This is a clutch used in connection with a car developing 30 horsepower, A. L. A. M. rating, and one that has at times developed much higher horsepower on the block—as high as 36 horsepower. The clutch angle is 13 degrees and the frictional area the first two years this car was built was 86 square

Fig. 25—Early example of conical type of clutch.

inches, but this has recently been raised to 96 square inches, the spring pressure remaining at 400 pounds. It will be noted at the bottom of this cut that there is a sketch showing the spiral spring plungers underneath the leather. Fig. 25 shows an early form of cone clutch used about 1902 or 1903 for a car of about 20 horsepower. This has multi-springs for creating the proper frictional contact and a peculiar form of spring application, simple in the extreme. One of the early forms of toggle joint is also shown at *A*. This gave in its day what was considered very good service.

Some Modifications of Cone Clutches.

In the *Commercial Motor* for October 31, 1907, p. 218, is shown what may be called a multi-cone clutch. This is seen in Fig. 26. The explanation, to be as simple as possible, is that when the clutch engages, the smallest cone seizes first, commences to revolve and subjects the spiral spring between the next two clutches to torsional movement, which draws them together and brings the two outer cones into action; the idea being that the small clutch shall slip, tend to accelerate the car, that the medium

clutch shall behave in a similar manner and that when the large clutch comes into play the three combined pick up the load and move the car. As far as I know, this has not been tried out sufficiently to say whether or not it is a practical success, but it is interesting in showing the amount of thought that has been given to cone clutches.

I have said that theory did not enter into the clutch very much, but below is Fig. 27, which shows the peculiarity of a simple clutch embodying the tractrix curve. This curve is adopted because it is of such a form that by the figured relation of pressures and peripheral speed, wear ought to take place uniformly at all points regardless of the distance of the point from the center. The claim is made for it that the clearance required to complete the engagement is very small; that there is no wedging action between the two members of the clutch and that there is no chance for it to bind. Also that it is simple and particularly adaptable to metal-to-metal clutches.

Numerous Designs Show Study Devoted to Subject.

It is in effect a flat disc clutch which will not wear faster near its outside edge than near its inside edge, but beyond that I see no gain. It would certainly require very heavy axial spring pressure, just as a flat disc would. The matter of wear is of little moment, either with flat discs or cones. The so-called inverted cone is well illustrated in Fig. 28. The reversed cone is contained in an extension *A*, built onto the flywheel *B*.

Fig. 26—A variation employing multiple cones.

When the cone is disengaged it moves toward the engine, exactly reversing the action of the foregoing type. This clutch has its adherents, and it is a good one, differing very slightly, if properly assembled, in its efficiency from the direct-acting cone. It may be kept free from dirt and oil much more perfectly than in the other form.

A simple formula for calculating the ordinary cone clutch is the following, by Chas. H. Schabinger, taken from *The Horseless Age* of October 2, 1907:

$$h.p. = \frac{P f r R}{63,000 \sin O}$$

P = Assumed pressure of engaging spring in pounds;
f = Coefficient of friction, which in ordinary practice is about 0.25;

Fig. 27—Type embodying the tractrix curve.

Fig. 28—Inverted type of cone clutch.

Fig. 29—Form of expanding band clutch.

r = means radius of the cone in inches;
 R = revolutions of the motor per minute.

$\sin O$ = Sine of the angle of the clutch.

To obtain the size of spring when the horsepower is known, the following formula may be used with good results:

$$P = \frac{h.p. 63,000 \sin O}{f r R}$$

the same symbols being used as in the preceding formula. It will be noted that the coefficient of friction used is 0.25. This is probably near enough for a properly lubricated leather-iron clutch.

The next type of clutch may be classified as internal expanding band or ring. This has had many exponents in the automobile art, but is open to centrifugal effects to such an extent that it requires considerable ingenuity to overcome troubles arising therefrom. At high engine speeds the operating levers have in many cases been so arranged as to lower the normal pressure between the frictional surfaces, resulting in a slippage and arbitrarily fixing a maximum limit of speed for the car on the high gear and of horsepower possible to develop in low gear. Fig 29 shows a clutch operating on the same principle, driving a 16-horsepower car, the spring pull being 50 pounds, the diameter of the clutch about 9.50 inches, and the width of the band 2 inches.

This clutch was a particularly soft operating one, but did release at high engine speeds. It operated best with a certain definite quality and quantity of lubricant, which, if varied to any great extent, caused a slipping clutch or a sharply biting clutch. The tendency of the clutch is to unwrap and expand against the enclosing cylinder as soon as any friction is applied to it.

Fig. 30. Modifications of Band Types of Clutches.

Fig. 31.

The successor of this clutch is shown in Fig. 30, so designed as to overcome the centrifugal releasing effect of levers in the clutch shown in Fig. 29. The total area of the clutch is 36 square inches and the two springs are of 125 pounds tension each. This clutch was a success, but was finally given up in favor of a simple cone.

Contracting Band Types of Clutches.

The exponents of the contracting band type of clutch are few and far between, unless the contracting spiral be so classed, and perhaps it ought to be. Figs. 32 and 33 show a contracting band characteristic of one of the prominent French cars (Mors). A leather-lined flexible steel band (8) contracts against a steel cylindrical band (2) bolted onto the flywheel (1). Clutches of

this character are seldom found in the automobile industry, except in two-speed cars, where a planetary gear-set is used.

About 1897 a single-cylinder 10-horsepower car was equipped with such a clutch as shown in Fig. 33, a leather-lined band, very flexible in character, wrapping around the hub of a flywheel and tightened with a spring pressure of about 50 pounds against a wedge. In this clutch a weight was furnished which would throw out at high speeds and further tend to tighten the band about the hub of the flywheel. The fact that this clutch has not had any successors is an indication that it could not compete with other forms; nevertheless, it was a successful clutch, especially for its time.

Fig. 32. Sectional and Plan Views, Mors Contracting Band Type.

Fig. 33.

Fig. 31 shows a form of clutch that has had prominent adherents. It is the wrapping spiral spring, of either hard or soft metal. The cut indicates the spring in cross section, marked "6," wrapping on the drum 4. Probably the greatest enemy to this clutch has been the adjustment of the clutching force. With too little lubrication they will not pick up their load rapidly enough. The margin is narrow and hard to control. With a viscous lubricant there is enough drag to make the gears clash badly. The disengagement is not very complete at the best.

Fig. 34—An example of a wrapping band type.

(To be concluded next week.)

NEW METAL VALUABLE FOR AERONAUTS.

According to *Aeronautics*, McAdamite is the title of a new alloy that should prove of wide application, and be particularly valuable to the flying machine industry. Most of the best alloys heretofore produced have about 16,000 pounds compression strength, while McAdamite has 126,000 pounds per square inch. The new metal also has a higher elastic limit than most others, or 84,000 pounds before the yield point is reached. Where the very best of the bronzes could barely claim 38,000 pounds per square inch torsional strength, this alloy has 60,000 pounds, or nearly as much as some steel. In cast metals it is well known that the tensile strength is low, but even here this new metal is very strong, as it shows nearly 45,000 pounds per square inch. The specific gravity of cast McAdamite is 3.20, as against 2.56 for aluminum and 2.98 for partinium. There is a shrinkage in casting it of 12 to 14 per cent. Its melting point is 977 degrees Fahrenheit as against 1,830 degrees Fahrenheit for brass; but, roughly speaking, it has nearly three times the strength in any direction, and three times the volume or one-third the weight of brass. Various degrees of strength and hardness are obtained by the mode of casting. So homogeneous is this metal and so free from gas that intricate and delicate castings can be made.

FRENCHMEN ADOPT QUICK DETACHABLE IDEA.

PARIS, May 13.—It is a rather curious fact that America and France should have worked on entirely opposite lines in the development of labor-saving devices for changing tires. In the United States quick-change tires, in which the outer flange only is removed, are so common as to be found on practically nine-tenths of the current models. Dismountable rims, on the other hand, have found little favor except for racing purposes, more

Sectional Views Showing New French Detachable Rim.

than one firm having put a rim of this type on the market having been obliged to withdraw it for want of support. In France the dismountable rim has long been recognized as a necessity for touring, several firms fitting them without extra charge as a standard equipment, and supplying special brackets for carrying the inflated tires. The quick-change rim, so familiar to Americans, has hardly existed.

One of the first of this latter type has just been put on the market, and, because of its distinctive features, is worthy of a description. The steel rim encircling the felloe is in two parts, one, consisting of the inner flange and encircling band, being permanently attached to the wheel. The outer detachable flange portion is secured on six bolts passing through the face of the wooden felloe and held by six nuts. For further security, the detachable rim is made with a tongue fitting under the lip of the permanent rim. Safety lugs and valve are of the ordinary type. Compared with the usual type of detachable rim there are six points of attachment instead of one, but the few extra seconds spent in attaching are repaid by the assurance that it is impossible for the detachable section to detach itself when not desired.

A Mirror to See the Road Ahead.

An improvement on the usual type of mirror employed to show whether the road ahead of an obstructing vehicle is free or not has been put on the market by a French inventor. Owing to the fact that he is seated low, the driver of an automobile is more handicapped in this respect than the person in charge of a horse vehicle. The improvement, as shown in the sketch

Diagram Illustrating Location Road Reflecting Mirror.

reproduced herewith from *L'Automobile*, consists in placing a mirror at as high a point as possible on the left-hand side of the body of the car. The mirror *A* has thus a much longer range of vision than is possible to the man at the wheel of the car. The mirror *B* attached to an upright from the outer edge of the dash, is pivoted in such a way that it can reflect all that is shown by the observation mirror *B*. The practical result of the arrangement is that the driver's range of vision is equal to what he would have if seated with his head on a level with the roof of the car. The third mirror *C* is the one usually employed to show whether any vehicle in the rear is attempting to overtake the car.

LATEST NEWS OF THE GRAND PRIX.

PARIS, May 15.—Gasoline and tire stations at the grandstands on the Dieppe course have been drawn for by lot, in order that the parties interested might, if desired, rent grandstand seats opposite the spot on which their own cars will draw up. The Thomas car, which was represented at the meeting by W. S. Hogan, the A. C. A. delegate in Paris, drew seventh position, immediately after Mercedes and Austin, and just before Panhard and Weigel. The first number drawn gave the firm represented the right to the box nearest to the starting and finishing line, the others following after in the order of drawing.

The first position fell to Dietrich, the others following in this order: Germain, Bayard-Clement, Mercedes, Austin, Thomas, Panhard, Weigel, Samson tires, Continental tires, Nanterre oils, Bosch magnetos, Dunlop tires, Michelin tires, Renault, Motobloc, Opel, Brasier, Fiat, Porthos, Itala, Benz. The space given to each firm, whatever the number of cars entered, measures 15 by 16 feet between the front of the grandstand and the road. The boxes themselves are slightly sunk down in the ground, and will hardly be visible from the stands, but the cars themselves, drawn up opposite them, will be in full view. As the men at the stations are only allowed to hand goods over to the drivers, and must not give any help whatever, nothing would have been gained by putting their quarters on the level of the road; the boardings would, indeed, have tended to hide the cars and their teams from the view of the spectators.

Immediately the stations had been selected, the firms concerned secured their own positions for the two days of the races, naturally renting those seats which would give them a full view of their own cars. It is declared at the club that the demand for seats is stronger than usual at this early date.

Entries Finally Close Monday, June 1.

Final closing of entries for both the Grand Prix and the Voiturette races will take place on June 1, by which date it is expected that the former list will have been lengthened by the engagement of three Mors cars already on the road, and which will be entered if they give satisfactory results on the road tests. The drawing of positions for the start of the races will take place at the clubhouse on June 5.

The full team of Panhard racers has now been put on the road, making the fourth set of Grand Prix cars to leave the factories. The others are Bayard-Clement, Motobloc and Benz. Though the external features of the new Panhards cannot be hidden from the public, the factory officials are not at all talkative about their models or inclined to give any information about the tests made. Last year's dashboard radiator, on the lines of the Renault, which was a distinctive feature of the Panhard, has not been repeated for 1908, the new cars having a strongly pronounced Panhard appearance with the familiar type of radiator just behind the front axle. Final drive is by double side-chains, as in the touring cars, the employment of shaft drive, which has been a feature of Panhard racers since 1904, not being continued this year. Regarding the engine, not much more can be learned than that it is a four-cylinder of the maximum bore and 6.6 inches stroke, the cylinders being of steel and copper jacketed as last year.

INTERESTING GAS ENGINE CYCLE DEVELOPMENT

By ERNEST COLER, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

THE two- and four-cycle engines now in use are outgrowths of the Beau de Rochas cycle, supposed to conform to his four axioms covering the ideal conditions of gas engine operation. These axioms are as follows:

1. Highest possible pressure at the beginning of the stroke.
2. Maximum speed of expansion.
3. Expansion to the lowest possible pressure.
4. Maximum cylinder volume with minimum wall space.

The Beau de Rochas cycle falls short of these conditions, because—

1. The highest pressure is not reached with a given compression on account of imperfect scavenging.
2. The speed of expansion is limited to that of the piston, which has a limit for mechanical reasons. In this respect, the "free-flying piston" engine is superior.
3. Expansion is not carried very far. Pressures as high as 60 pounds per square inch are rejected to the exhaust.
4. Maximum volume with minimum surface is counteracted by excessive wall cooling necessitated by lubrication, preignition and charge-reduction conditions.

With a view to overcoming these disadvantages, Robert Miller has developed an internal combustion motor having a modified cycle, and which combines the features of lightness with frequency of impulse and a minimum number of parts. In this new motor, the "Miller cycle" modifies the foregoing conditions in the following manner:

The pressure at the beginning of the stroke will be higher, as the cylinders and clearance spaces are thoroughly scavenged by an excess of cold pure air.

The speed of expansion is increased by allowing the burning charge to expand simultaneously in a supplemental expansion cylinder during the expansion stroke only. Since the combined volume of the combustion and the expansion cylinders is thrice that of the combustion cylinder, the speed of expansion must be three times as fast as that in an ordinary cylinder with the same piston speed and stroke.

To illustrate this, we will assume a piston speed of 900 feet per minute, and a stroke of 12 inches. The ordinary cylinder will expand its charge from 300 pounds to 45 pounds per square inch in 1-900 of a minute. The "Miller cycle" expands this same charge between the same limits, in 1-3 of 1-900 = 1-2700 of one minute.

The expansion must be carried to a lower limit, in view of the above statement, because this same expansion cylinder will bring the terminal pressure down to about 10 pounds per square inch, the terminal volume being three times the initial volume of the charges above compression.

This method of increased expansion differs widely from the two commonly used. The true compound gas engine (two-stroke expansion) fails because of the low specific heat of the working fluid, the transference of highly heated gas through small ports and valves, which must be kept cool to insure durability, and the enormous amount of cooling surface in-

involved in a high and low-pressure cylinder. The other method, using a small charge (either cut short on the suction stroke or expelling some on the compression stroke), involves a long stroke, and what is gained by increased expansion is lost by increased time of contact with cold cylinder walls. Wall cooling is effected in the "Miller cycle" by the scavenging action of the cold air acting upon the inside of the cylinder. The cycle itself gives a cool cylinder wall, and the exhaust is used as an ejector to draw cold air over the outside of the walls, where necessary, thus rendering the engine independent of fans, pumps, blowers or radiators. The fuel injection also abstracts heat from the charge, because liquids, to pass into vapor, must receive heat.

The engine will be light per unit of power, because more heat will be converted into work instead of being wasted through the cylinder walls and in the exhaust; also the charge weight and M. E. P. must be higher, because the charge is cold, at atmospheric pressure, and its fuel component is added during the compression stroke. Its reliability will be insured because every charge is uncontaminated with burnt residue, and it should be superior to the four-cycle, for the same reason that the four-cycle is superior to the two-cycle—differences in scavenging; and, in addition, the fuel being injected positively during the compression stroke, there are no carbureter troubles.

Referring to the accompanying drawings, we shall go through a complete cycle in one cylinder, the drawing showing a double-acting engine. Assume that in the clearance space of the upper cylinder an explosion is about to take place. At that moment the valve *b* being open, establishes communication between the chamber *a*, and the expansion cylinder *c*, the valve *d* being closed. The result is that the force of this explosion will be expanded in the cylinders *a*, and *c*, so that the expansion will be very rapid, and as the piston reaches the end of its stroke the volume of the combined cylinders *a*, and *c*, will be much greater than of *a*, alone. The expansion must then have been carried to somewhere about 10 pounds terminal pressure, with the result that very little heat has gone through the cylinder wall. While the differential piston was moving in this direction, having on one side the explosive impulse, on the other side it

Sectional Elevation, Cross Section and Plan Sectional Views of the Miller Engine.

was compressing the pure air that is contained between it and the cylinder head, after the manner of the Diesel cycle.

As the differential piston nears the end of its stroke, the valve *d*, will open so that the remaining pressure in the combined cylinder volumes *a*, and *c*, will escape through one port in this valve. As this pressure dies away, the compressed air from the preliminary compression chamber will go through the connecting pipe, through the valve *d* and through the ports *g*. Coming through the ports *g*, this air will traverse the body of the cylinder *a* around through the clearance, through the valve *b*, around through the chamber *c*, and out through the exhaust port of valve *d*. Being in volume about three times as large as that of the cylinder *a*, this pure air will thoroughly scavenge the cylinder, clearance and all, at the same time exercising a cooling effect. That this scavenging will be superior to that of the ordinary cycles will appear when it is considered that in the ordinary two-cycle the scavenging is generally considered to begin at the outer dead center. With this cycle, however, owing to the fact that the gases, at release, are already expanded to a low pressure, scavenging will commence much earlier, and in that most effective part of the stroke, the slow period around the dead center. The time element is an important point in two-cycle functioning.

The piston is now ready to start on its return stroke. The valve *b*, closes, and the valve *d*, remains open. The contracted portion of the differential piston compresses pure air in the chamber *a*, while the differential portion of the piston sweeps out the combined burnt gas and air through an exhaust port in the valve *d*. At a predetermined period of the stroke the fuel pump injects the charge into the chamber *a*, where it is thoroughly mixed by the whirl of the compressed air from the piston. Just before the stroke occurs, the valve *d*, is closed, and the valve *b*, gradually opens. During this time the trapped gases in the chamber *c*, are gradually brought to approximately the same pressure as exists in *a*. Ignition then occurs, and the cycle

is repeated in exactly the order of operations just explained.

It must be remembered that on the inward-stroke, while the differential piston is on its smallest portion compressing the new charge, and on its larger portion expelling the burnt gases from the chamber *c*, on the other side it is drawing in a new charge of air through a check-valve, or through a modification in the valve *d*. This engine renders self-starting very easy. It is hardly possible, with the clutch out, that it would stop on dead center, because it would be against the full compression in either combustion chamber. It would, therefore, stop somewhere near mid-stroke. If the fuel pump inject fuel into the chamber *a*, and also into the chamber *c*, ignition in *a*, would travel through to chamber *c*, and a powerful impulse be given to the crankshaft, somewhat in the manner of the compression explosion obtained with the Clerk-Lanchester self-starter, as used in large English gas engines. Reversing with this engine, while probably not desirable for small motor cars, may yet be used for railway and trolley car work.

Assume, in the double-acting type, that an explosion occurs in the top cylinder and, therefore, a new charge is being compressed in the lower cylinder. If a reversing eccentric be fitted and the engine be thrown into a reverse position, in the top cylinder, which is going through an explosion impulse, the exhaust valve *d*, will open, relieving the impulse, and in the lower cylinder the differential portion of the piston, instead of expelling the burnt gases, the valve *d*, will close, and the engine would gradually slow up on an air cushion, the gases being trapped in the cylinder. As the engine slows up, the igniter being tripped prematurely, the engine would reverse both from the premature explosion and the energy stored up in the compressed gases in the cylinder *c*. Rotary valves are shown, but, of course, poppet valves could also be fitted. The rotary valves have the advantage of simplicity and long life, if properly cooled, and are used on the largest air compressors, while none of the other features of the motor represent departures out of the ordinary.

MECHANICAL BRANCH MEETS IN CLEVELAND.

In accordance with the policy suggested at the meeting of the mechanical branch of the Association of Licensed Automobile Manufacturers in Chicago last December, that the branch meetings be held at different points throughout the country, in order to give the engineers an opportunity to inspect and study the different factory methods of its members, the next meeting of the mechanical branch will be held at the Hollenden Hotel in Cleveland Friday, May 22.

The morning session will be devoted to taking up the subjects of proposed standard brake and clutch levers, which have been given a certain amount of attention by the engineers, and especially the Test Committee, for the past three or four months. A full report of data gathered by the Test Committee relative to the dynamometer of the Automobile Club of America will be given and discussed. The report of the dynamometer tests, held earlier in the month, is expected to contain some interesting matter. Papers on the two-cycle motor will be read by E. W. Roberts, and A. W. Thompson, of the Electric Welding Products Company, will give an illustrated lecture on the advantages of combination valves, nickel steel heads and carbon steel ends.

In the afternoon, and possibly the following day, the local factories will be visited by the engineers in a body, and factory and shop methods will be closely studied by the visitors. Thomas Henderson, vice-president of the Winton Company, located in Cleveland, and a member of the executive committee of the Licensed Association, is arranging the details of the inspection trips, and he hopes to have a very interesting and educational program arranged. This interchange of visits to the different plants of the members of the Licensed Association is one of the chief features of the policy recently adopted of holding the meetings of the Branch in different cities that members may become conversant with the various shop systems and methods.

INDISPENSABLE BOOKS FOR TOURING.

The publishers and compilers of THE AUTOMOBILE "Blue Book" have one object only, and that is, as practical autoists, acquainted by road experience with the actual necessities of other drivers, to meet the everyday matter-of-fact requirements of the man at the wheel, and to give the best and most accurate routes, details, directions, and maps which can be made or gathered from reliable sources. To obtain this, they have on the road their own machine, with competent investigators and compilers, and also have the cooperation of secretaries of automobile clubs and hotel men and every garage keeper who can be impressed into the service. Even then, with all their accumulated knowledge and zeal (indeed, by reason of it), there comes with every year the need for a revision and extension of every section.

It is in the order of requirements that New England should receive the publishers' first consideration, for into it, and through it, flows the greatest percentage of the summer automobile traffic of the continent. With this, the latest and best fund of material facts, at his finger tips, the traveler will be enabled to lay out a route to suit his time and desire. It is all there, either in broad, simple, comprehensive skeleton maps, or in detailed diagrams, showing where to start, where to turn, how far has been covered in a given time, and where to stop, as well as that equally important factor, where supplies can be got, or repairs made to his machine. And all this indexed, cross-indexed, and dovetailed together into such a simple whole that a man may travel for weeks through all the States of New England, in a thousand different directions, and find all the material information within the limits covered betwixt a pair of covers of a light, thin, flexible book, easily and cozily snuggled away in a driving-coat pocket or a get-at-able receptacle. It is the compactness and accessibility of the great amount of information furnished that appeals to the autoist as much as its intrinsic value.

LETTERS INTERESTING AND INSTRUCTIVE

CAUSE OF EXHAUST VALVE STEM BURNING.

Editor THE AUTOMOBILE:

[1,366.]—I have a single-cylinder motor which is air-cooled around the body of the cylinder and has a water-cooling chamber on the cylinder head, and have had trouble for the last three months with the exhaust valve stem becoming burned where it joins the head. I had no trouble with the original valve, but had to replace it as the slot had cut through the end. I have since made three new valves—the first from a forging and the second two from cold rolled steel. The first broke off at the head, after running about three weeks, and seemed badly burnt, and it is now necessary to replace the third one, as the stem is burnt to about half the size. I have carefully ground each valve with powdered emery and they run nicely at first. Do you think there is something wrong in the cooling, or is the trouble caused by the valve not opening enough? Kindly advise me through the columns of "The Automobile."
W. S. CHISHOLM.
Benicia, Cal.

We think it is probable the trouble may be caused by the fact that the hole in the casting through which the valve stem works may have become worn sufficiently to permit the exhaust gases to escape around the stem to a certain extent, which would readily account for the burning at the point in question. Watching the motor closely while working should reveal whether this is the case or not. We do not believe it is due to any defect in the cooling, though if the water-jacket mentioned includes the exhaust valve pocket, an examination may show that this portion of the cooling system is not working as efficiently as it did originally. In case the cause is found to be due to the worn valve stem hole, the best remedy is to drill the latter out and fit a bushing. Of course, a larger valve stem might be used, but as this would be apt to increase the weight of the valve it would not be an advantage. The cam and roller of the exhaust valve-operating mechanism may also show considerable wear, thus reducing the amount of opening, which would also cause overheating.

ABOUT THE ORDER OF MOTOR FIRING.

Editor THE AUTOMOBILE:

[1,367.]—Referring to inquiry No. 1,344, I do not see how Mr. Bryant can fire his motor in the order 4, 2, 3, 1, if the cranks are set 180 degrees apart, as in most four-cylinder motors. When No. 4 is going down on the firing stroke, No. 2 is going up on the compression stroke; No. 3 is going up on the compression or the exhaust stroke, and No. 1 is going down on the suction stroke. No. 3 cannot be on the compression stroke with No. 2, so it must be on the exhaust stroke, so that the cycle is disarranged. I think his motor fires 4, 2, 1, 3 or 4, 3, 1, 2.
Pittsfield, Mass.

W. J. EAGE.

A little study of the order of firing the average four-cylinder motor in which the cranks are arranged in pairs in two planes, 180 degrees apart, will show the order mentioned by the inquirer in question (1,344), to be erroneous. This, however, had no particular bearing on his inquiry, which concerned the manner of timing a magneto to run the motor, as it is only necessary to time one cylinder to bring the two in step, as the magneto contact maker and distributor are so designed as to fall into step with the motor, and remain synchronous with it, once they are properly adjusted. It must be apparent that where the order commences 4, 2, cylinder No. 3 cannot be the next to fire, as in order to do so it would have had to be on its suction stroke at the same time as cylinder No. 2 is compressing, which is out of the question, owing to the fact that it is then on an up-stroke. If the latter were a compression stroke, then cylinders Nos. 2 and 3 would have to fire together. The changes you suggest would remedy matters, taking cylinder No. 4 as the first to fire in each instance. It will be apparent that, as the two pairs of cylinders are in different planes, the end pair and the center pair usually running together, it is impossible for the two cylinders having pistons in the same plane to follow one another in the order of firing, for reasons that must be obvious.

WINDLASS USED ON THE FLORIDA TRIP.

Editor THE AUTOMOBILE:

[1,368.]—Regarding the inclosed clipping from "The Automobile" of last week, describing the trip through Florida, will you not kindly publish a sketch or further directions, making plain the method of constructing and using this windlass? All autoists would appreciate this information, of such a contrivance, if it will "pull the bottom of the earth out." I cannot find any mechanical engineer who understands it from the description given. J. A. C. K.
Newburgh, N. Y.

The clipping reads as follows: "Then came the job of getting the Peerless out of its predicament. The guide put through a plan that future tourists should remember. Our salvation was what he called a 'Spanish Windlass.' Let me tell you that it beats a block and tackle or a team of horses all hollow, and it is always available. There were no trees within reach, so 80 feet in front of the car he planted a stake, to which he fastened one end of the rope. Then half way between it and the car he planted another stake, around which he made a turn of the rope and a loop, into which he inserted a strong sapling pole he had cut. The other end of the rope was fastened to the axle of the car. Then two of us manned the sapling pole and walked around with it while two others pried up the car wheels with poles placed beneath the rear axle and hubs. We yanked the car out fairly easy. 'You can pull the bottom out of the earth with that,' said the guide. He did not seem far wrong in the light of our experience."

Editor THE AUTOMOBILE:

[1,369.]—In John C. Wetmore's article, "Skirting Florida's East Coast," published in your issue of April 23, he describes in the last half column a "Spanish Windlass." If you will refer to this, I think you will see that his description is rather vague. I would like to know just how this contrivance is set up and operated, and will be greatly obliged if you can furnish this information.
Worcester, Mass.

HORACE H. FIELD.

As will be apparent from the accompanying sketch, a rope is made fast to the forward axle of the car and led to the nearest tree or other solid object, failing which a stake is solidly driven into the ground, and the rope attached to it.

The Spanish Windlass and its Method of Operation.

About midway between the car and this stake the rope is wound around a pole, a small tree usually forming the most available material for this purpose. A second pole, or lever, is then inserted in a loop of the rope where it is wound around the upright pole, which need not be planted firmly in the ground, but can be held by one of the party. By placing a man at each end of this long lever and walking around with it clockwise, the rope having been wound upon it in that direction, the device virtually forms a windlass and it will be apparent that the rope will wind up on the pole from both directions, and if a long pole is employed to insert through the loop of the rope a tremendous leverage can be utilized.

The arrangement in question is graphically illustrated by the accompanying sketch, which will serve to make the details much

clearer than would be possible with a ream of description. If a tree is available for the anchoring point shown at the right-hand end, so much the better. Otherwise the stake will have to be as firmly planted and braced as the car is imbedded in the mud—in fact, more so, as the amount of force necessary to start the car moving from its bed must not be such as to disturb the stake. Otherwise the stake would be pulled up instead of moving the car. The pole or sapling held by the man in the middle, who is doing the heavy looking-on, need not be extra heavy, though once the rope begins to wind on it some distance from the center, it will begin to bend considerably under the strain. If it be not stiff enough to stand it, and the car is still far from being out of its predicament, a fresh start may be made by unwinding the rope from the pole until it is back to its original three or four turns, the surplus rope being taken up either at the car axle or at the other end. It is not necessary to plant this upright pole in any way, as its holder must move backward as the winding of the rope brings the whole windlass nearer its anchor.

The details of the manner of winding the rope and inserting the third pole, which is used as the sweep of the windlass, is shown on an enlarged scale by the sketch in the upper right-hand corner of the drawing. The upright is represented by *A*, the windlass sweep by *B*, and the rope by *C* and *D*, the former end going to the car axle, and the latter to the anchor.

USING DOPE IN A PLANETARY GEAR SET.

Editor THE AUTOMOBILE:

[1,370.]—In "The Automobile" of April 23 you have a letter, No. 1,321, treating on the use of a mixture of sawdust and grease for the purpose of silencing gears. I would like to ask if such a combination would be good in the planetary transmission of a Model S Ford, which transmission, as everybody knows, is very noisy.

Belleville, Ill.

H. C. GASS.

The instructions of the makers of cars equipped with this type of gear-set are usually to the effect that nothing but comparatively light oil should be used in them, chiefly for the reason that the pinions are so small that the introduction of a heavy grease would tend to increase the friction of the gear to a great extent. This would seem to be the only objection, and, as your car has plenty of power to spare, it would not be detrimental to resort to this expedient to get rid of most of the noise. The planetary gear-set is something that is extremely difficult to make silent when running on the low gear, or idle, though much of the noise created by the Ford seems to be occasioned by the high speed at which the motor is run. You will find a later letter, No. 1,345, in the issue of May 7, in which the writer describes his experience with silencing compounds, and which you will doubtless find very interesting. There seems to be no reason why the same expedient could not be adopted in your case.

WANTED: A LIGHT 2-CYCLE AIR-COOLED MOTOR.

Editor THE AUTOMOBILE:

[1,371.]—I want to build a light car that will take hard roads and steep grades, and one that will give no trouble to those having no experience in taking care of a motor or car. I would like to employ a two-cycle, air-cooled motor, as it is light for the power, has few parts, etc., but have some friends who tried a certain make and they were not satisfied at all. I have a circular of the Speedwell motor, and letters from a Pennsylvania firm, A. H. Yocum, Reading, Pa. According to the description of their motor, I think it is what I want, but I cannot afford to make experiments and must get the right thing the first time. I am a good mechanic and am able to build anything in this line, as you will see by the car I have just completed, which I am sending you a blue-print of. If you care to publish this, with a description, I will send you a better photograph and tell you what can be made in the Far West, a long way from anywhere.

Jerome, Ariz.

ARTHUR HENDEY.

We are not acquainted with a two-cycle motor of the name you mention, nor do we know the product of the firm in question, and so are not in a position to help you out in either case. We should be pleased to receive a photograph of the car you have built, together with a description of it, for publication.

ONE SET OF PLUGS WITH DUAL IGNITION.

Editor THE AUTOMOBILE:

[1,372.]—Will you kindly answer, in "Letters Interesting and Instructive," this question? Would it be possible to use a single set of spark plugs in a six-cylinder engine that has an Eisemann low-tension magneto and a storage battery system of ignition? Both systems are entirely separate now, and I use two sets of plugs, which are set in a funnel-shaped brass casting, so as to have both plugs over the intake valve on each cylinder; this method of placing the plugs brings them about an inch and a quarter out of the cylinder.

Minneapolis, Minn.

C. B. RICHARDS.

This is done on the Packard car and forms a regular part of its standard equipment. You say Eisemann "low-tension" magneto, but presume you mean high-tension. The makers of the Eisemann will provide you with the necessary parts for making the change.

MARKETING AN AUTOMOBILE INVENTION.

Editor THE AUTOMOBILE:

[1,373.]—Being a reader of your paper, I take the liberty of writing you. Can you give me the desired information? I have invented an automobile street sweeper, and would like to submit my invention to a company, manufacturers of electric or gasoline trucks. I thought you could advise me as to the company most likely to be interested in such an invention.

Hartford, Conn.

W. H. HADLEY.

We are not in a position to give you any information concerning a manufacturer who would be apt to take an interest in your invention, but the publication of your letter in these columns may chance to bring it before someone who may be able to help you out.

AN EXPLANATION OF THE MAGNETO TROUBLE.

Editor THE AUTOMOBILE:

[1,374.]—I note H. J. Bryant's trouble in replacing his magneto. In your issue of the 7th. While your directions for replacing and setting same are all right, it might be of interest to have some sort of an explanation of his trouble.

Most magnetos have their armatures turn at crankshaft speed. There are, far as I am aware, only two exceptions to this rule. Incorporated with most magnetos is a secondary current distributor. This, of course, turns only at one-half of the crankshaft speed, therefore the distributor only makes one revolution to two of the armature shaft. If the armature of the magneto had received one complete turn while the magneto was off its position on the motor or the motor had received the same, everything would have been replaced apparently as it was before, but the distributor would be found to be one-half a revolution out of the way. This would not be apparent without an examination of the motor and the distributor.

The simplest remedy would be to remove the magneto and give the armature one revolution or to disconnect the two-to-one gear of the magneto distributor and give the distributor one-half of a revolution. It is immaterial which of these is done, but one may be mechanically easier than the other.

Boston, Mass.

HAROLD H. BROWN.

FOR TOURISTS WHO CROSS THE BORDER.

Editor THE AUTOMOBILE:

[1,375.]—Under the heading "Taking Cars Across the Border" in your issue of the 30th ult., you make mention that for a sum not exceeding \$10 we are able to furnish all that is necessary for an American touring Canada where the car crosses by way of Niagara Falls, Buffalo or Detroit. This is perfectly correct, but we would like it understood that we are able to send the requisite documents and tags through the mail to the home of the intending tourist, enabling him to cross without delay or interference at any point on the frontier.

Niagara Falls, Can.

THE C. S. WARNER COMPANY,

Roland Margetts, Mgr.

WHAT AN INTERESTED OBSERVER SAW.

Editor THE AUTOMOBILE:

[1,376.]—Coming downtown recently I saw the latest thing in taxicabs. It was a car of uncertain vintage and ungainly lines with an equally awkward-looking body perched on it, and—it had a taximeter, but observation failed to reveal any connection with the wheels by which it could operate when traveling.

New York City.

TEXAS FINDS AUTO AN ECONOMICAL NECESSITY

By F. S. SLY, TRAVELING CORRESPONDENT FOR THE AUTOMOBILE.

HOUSTON, TEX.—This city now boasts one of the most flourishing automobile clubs to be found anywhere in the Southwest. Beside the 200 or more cars here, most of which belong to members of the club, there are many non-owners who are working hard for the club's benefit and the cause of automobiling. In fact, the club has been largely instrumental in securing the recent issue of \$5,000,000 in bonds for the improvement of the roads of Harris county. H. T. P. Wilson is the presiding officer of the organization, while Sam Bering is secretary and treasurer.

A great many well-known cars are represented here, in addition to which manufacturing has been begun on a moderate scale by the Southern Motor Car Company, which builds the Dixie.

There are no less than five up-to-date garages run by the following: J. Wade Cox, representing the Ford; Empire State Motor Car Company, handling the Maxwell, American Roadster and American Mors; Houston Motor Car Company, the Pierce, Thomas and Mitchell; Mosehart & Kella Company, the Locomobile, White and Buick, and the Auto & Motor Boat Company, the Wayne.

Business has not been unusually brisk so far this year, but the prospects for a good selling season are bright.

San Antonio One of the Best Auto Marts.

SAN ANTONIO, TEX.—Trade has been very quiet here this year up to the present, and the dealers are not looking forward to an over-prosperous season. The vast road improvements planned will do much to awaken interest, and there is no doubt that quite a number of cars will be sold within the next few months. A very large slice of the \$5,000,000 good roads' appropriation is to be expended in this vicinity; all roads leading out of the city are to be macadamized for a distance of 12 miles, in addition to which there is already an 18-mile macadamized loop in existence, and it is expected that a 40-mile loop of macadamized road will be completed during the coming summer. It is anticipated that a road race will be planned for this course as soon as it is completed, besides which the auto races are a very prominent feature of the fair to be held in September.

There are now 285 cars owned in the city, while quite a number of farmers in the surrounding country invested in cars last year, one firm alone having disposed of no less than 35 cars to agriculturists last summer.

The local club, of which Dr. W. B. Russ is president, H. E. Ogg, vice-president, and Dr. Fairfield, secretary and treasurer, is a progressive organization that counts about 65 owners of cars among its members.

There are quite a number of different cars represented here, but only three garages. The Automobile Station, which

maintains one of them, handles the Stevens-Duryea, Studebaker and Buick, while the Alamo Garage has the Stoddard-Dayton and the Auburn, and the Cook agency, which runs the third garage, represents the Ford and the Reo. The remainder are simply agencies, Bert Robbins having the Mitchell; Mackay has the Holsman, and the Fink agency, the Duer and the Brush run-about.

Texas a Paradise for the Highwheeler.

AUSTIN, TEX.—There are many more of the high-wheel buggy type of automobiles in this part of the country than anywhere else I have been. They are to be seen running around in numbers, and their use is not entirely confined to the rural population either, although they are naturally a favorite with the farmer. Quite a number of them were sold in this vicinity last year, and they are said to give excellent satisfaction in service. The Texas farmer usually does things on a pretty good scale, and is accordingly well accustomed to taking care of machinery, so that he finds the simple power plant of the high-wheeler a practical affair and has little or no trouble with it.

There are three good sized garages here, the Austin garage, representing the Pope-Hartford, Ford, Reo and Holsman; the F. Fischer Auto Company, and the Twentieth Century Garage, which do not do any agency business. Among the agencies here are A. C. Goethe, handling the Rambler; Howard Taylor, agent for the Dorris, and Elwell Nalle, who has the Thomas. The greater part of the demand for cars here comes from the country districts, some being bought by farmers, but the majority being used by country doctors.

There are about 75 cars in use in the city itself, and there was a club at one time, but apparently it no longer exists. The country roads are poor but passable, which is not saying a great deal.

Waco Has Some Good Stretches of Road

WACO, TEX.—There is one fine stretch of well-paved macadam road, 28 miles long, leading into this city, and there are also six or seven stretches of gravel road, seven or eight miles long, that are good. The rest are just about the average of the usual Texas road, which is poor. There are about 80 cars used in the city, but thus far no attempt has been made to organize a club.

The Franklin line is handled here by M. T. Bell; the Ford, by H. T. Cruger, who also maintains a garage, and the Maxwell line is represented by Percy Willis. M. Dupree has the Glide agency; S. F. Kirksey, the Thomas; and B. G. Campbell, the Buick. The Texas Auto & Transportation Company maintains the only other garage.

Business Prospects Bright in Dallas.

DALLAS, TEX.—This city is really the true fountain-head of Texan automobiling, for it can boast of more than 250 cars, and it has one of the most flourishing automobile clubs to be found anywhere in the Southwest. Colonel Hunter is the president, and Eugene Corley, the secretary and treasurer. The club holds runs every now and again, and is a strong advocate of the good roads movement. That it has been instrumental in accomplishing considerable in this direction seems evident from the fact that there are fully 200 miles of good macadam roads in this county. The black roads are good going in the summer, but very bad in winter. Business prospects are excellent, one agent already having disposed of 15 more cars than at the same date last year.

There are three large garages, and many prominent American cars are well represented. The Cameron Automobile Company has the Stevens-Duryea, Cadillac, Franklin, and Buick; the Dallas Novelty Manufacturing Company, the Reo and Baker elec-

How One Texas Firm Advertises.

trics; and the Maxwell-Briscoe-Handley Company, representing Maxwell interests as a branch house. The Studebaker Brothers Company also have a representative of their own here, but do not maintain a garage.

Galveston Presents But a Limited Field.

GALVESTON, TEX.—When the fact is considered that the entire island upon which the city of Galveston has been built is of sand, and there are no bridges on which automobiles can run

connecting it with the mainland, it is apparent that the area of travel open to a car is extremely limited. This is made even more so by the fact that many of the city streets are at present impassable owing to the work of raising the grade which is being carried on. Consequently, the only place to run an automobile is on the paved streets, as once off these the sand is very loose and deep. There is naturally not much demand for cars here at present. When improvements now in progress are completed the market will improve greatly.

AUTOISTS PROGRESSIVE IN THE GULF STATES

MOBILE, ALA., May 10.—It is difficult to conceive of more adverse conditions for autoing than exist in the southerly portion of the Gulf States, yet this city can boast of no less than 200 cars, despite the fact that it is hardly possible to drive a machine 100 miles without submitting it to an overhauling process to relieve it of the great quantities of sand that find their

Mobile Auto Company's Garage, Mobile, Ala.

way into every recess, regardless of the precautions taken to prevent it. The streets of Mobile are favorable for automobiling, but, even if it were a very much larger city than it is, its confines would not make a very ample field for the operation of a car. Once outside the city, there is nothing but sand, and it makes very hard traveling.

Autoists are progressive here, nevertheless, as a club is just being organized. G. J. Hartwell is the secretary and treasurer, and it is quite probable that H. H. Wefel will be elected president.

Quite a number of the well-known makes of cars are represented here and there are several good garages. The Southern Automobile Company maintains a modern garage and handles the White, Pierce and Buick; while the Mobile Automobile Company, which also has a garage, represents the Stoddard-Dayton, Mitchell and Glide. Bloch Brothers handle the Pope-Toledo, Pope-Hartford, Pope-Tribune, and National electric; while Gemthorpe & McKeon have the Maxwell line and run a garage.

Dealers state that the demand for automobiles in this section is almost entirely dependent upon the state of the lumber market, and as there has been more or less depression in the latter during the past few months, trade has not been active, though agents in Mobile are looking forward to a good season, as it is anticipated that conditions will become more favorable in the near future.

Crescent City Boasts Many Cars but No Roads.

NEW ORLEANS, LA., May 11.—This city forms one of the most striking examples of the introduction of the automobile in the face of adverse conditions that is to be found anywhere in this country. Here is a city of less than 300,000 people and with a

population that is almost 60 per cent. negro, yet while the per capita wealth of the white inhabitants is comparatively low, it can boast of almost 400 automobiles, though there is hardly a road outside of the city limits that can be dignified by the title. In fact, they are almost impassable, except in the direction of Baton Rouge. A movement is on foot looking to a good roads propaganda, but as yet it is still in embryo.

Even in the city itself, driving is limited to comparatively few streets, such as Canal and St. Charles, where the going is good. Most of the others impose a test on a car that few owners would care to submit it to, speeds of more than a few miles an hour being impossible over these streets, owing to the nature of their pavement, which consists of large stone blocks that were presumably on a level when originally laid, but which have been permitted to fall into such a state of disrepair that scarcely two are any longer in the same plane, so that driving over such a surface, even at the lowest speed, would be apt to rack a car badly. There is a club here, of which Samuel Stone is secretary-treasurer.

A Glimpse of Bienville Park, Mobile, Ala.

Quite a number of cars are represented here, and though agents report that business has been dull during the past few months, it is said to be picking up much better now. The Glide Motor Car Company handles the Glide, Ford, and Regal; while the Abbott Automobile Company has the Packard, Olds, and Buick, and maintains a garage, as does also the Automobile Company, representing the Locomobile. The only other garages are those of the Independent Auto Company, which handles the Stoddard-Dayton; M. Zilberman, and the Central Garage Company, both of the latter maintaining garages, but not representing any makers. Other agents are the Crescent City Auto Company, handling the Cleveland, Northern, and Palmer; Abner Powell, who handles the White, and H. A. Testard, who has the Cadillac and Pope-Toledo. Just as the state of the lumber market is the governing influence in southern Alabama, the demand for sugar and cotton has much to do with the purchase of automobiles here, and the fact that planters have been holding their cotton for better prices serves to explain the recent dullness.

Autoring Among Antiquities Glidden in Greece

Museum at Athens

ALMOST 1,000 miles were covered by Mr. and Mrs. Charles J. Glidden during their stay in Greece, which was terminated on April 16. Their pilgrimage in that land of classical lore was made from Piræus, around Athens to the plain of Marathon, to Tatoi, Thebes, Eleusis, Delphi, Nauplia, Mycenæ, Tyrius, Epidaurus, Corinth, and minor points famous in times long past. Greece has many attractions for the automobilist, although the roads are somewhat limited, and generally bad, but well graded. Of course, the scenery is superb to the antiquarian.

There are about thirty automobiles in Greece at the present time, mostly in Athens, and gasoline costs sixty cents a gallon—a serious handicap.

Mr. and Mrs. Glidden arrived in Paris May 10, after a tour of 3,831 miles in Egypt, Syria, Greece, Italy and France. They have now completed 46,123 miles of their 50,000-mile tour, and have traversed 14,000 towns. The next trip will comprise Algeria, Tunis, Norway, Russia, Cuba and South America. "Automobiles are still an object of curiosity in Turkey," says Mr. Glidden, "but their importation is now authorized by an imperial irade, and permits granted to two firms to establish an auto service in the interior, which will be running regularly within a short time.

Mars Hill

Theatre Herodes Atticus Parthenon on hill

HERE'S a French idea, workable in any large town: Every automobilist knows the difficulty of making his way through a strange town, particularly the large, populous places which cater to automobile tourists. Whether one is simply passing through, or proposes to lunch, sleep, or dine, it is annoying to have to poke along, first up one street and then down another, in the vain hope of tumbling by chance into one's hotel, only to finally land in some garbage heap away out on the other side of the town.

The average "native"—possessed often of the best intentions—more often puts one wrong than right, whereas three or four small boys, properly instructed as to the kind of information an automobilist *en tour* really wants, could point out the best way through a crowded town, and thus enable the man in the car to avoid many undesirable, and perhaps dangerous pitfalls, such as badly paved streets, dangerous level crossings—and police traps, too. They could indicate the best and shortest route to one's hotel, the garage where one might want to purchase supplies, the post and telegraph offices, etc.

A seat on the running board, and say a fee of ten cents, would be the small boy's charge, and he would thus by a natural process of evolution turn his fellows into friends of the automobilist, instead of the stone-throwing antagonistic opponents that they mostly are at the present time. As a profession of the youth of the land, that of "auto-pilot" should rival that of golfer's *caddie*, if this idea is followed out generally.

At Dinard, one of Normandy's fashionable watering places, the plan has already worked well, and this season may be expected to find the idea largely developed here and in other likely places as well. Why not?

A MODEL AUTO TOUR IN EUROPE.

By RODNEY OGILBY.

Each Summer witnesses an increase in the number of Americans automobiling over the splendid European roads. Paris is generally chosen as the starting-point, and so many tempting routes stretch away in all directions, like the spokes of some Titanic wheel, that it is no easy matter to choose between them.

Below this outline is a route which combines perhaps as many and as varied attractions as it is practicable to devise in a tour

of its length—the level and beautiful reaches of the chateau district, the magnificently scenic course of the Savoy Alpine-land, the smiling plains of Piedmont and Lombardy in Italy, and a glimpse of the lovely Italian Lakes. The tour ends at Aix-les-Bains, where the hotel and garage accommodations for visitors planning a lengthy stay are unsurpassed.

From Paris, the first day's run takes us to Orleans, a hundred miles. The route lies through Fontainebleau, with its far-famed castle and forest, and here lunch may comfortably be taken. Orleans itself is an interesting town, made famous by its associations with Joan of Arc. It is an Old World little place, with its Cathedral and quaint Town Hall, and has a choice of two or three reasonably good hotels.

Blois, forty miles below Orleans, may be regarded as the gateway of the chateau region, and Tours, forty miles farther still, is its center. At Tours, several days may be profitably spent, each with its interesting auto-excursion in this attractive neighborhood.

Touring now southwestwardly, we run on by Bourges and Moulins to Vichy—a pleasant two-day, 200-mile run over fine roads. Vichy is a lively little resort, and a good place for another brief stay. Then comes Lyons, a hundred miles farther; and, following that, Grenoble, seventy-five miles, where the level part of the tour ends for a time.

Grenoble is superbly situated, and in its vicinity are some extremely fine hill courses—roads winding into the heart of Alpine scenery, climbing frightful precipices with uniform and easy gradients, and invariably in the pink of condition, as are all French roads. Close by, too, is the venerable monastery of the Grande Chartreuse, where the unrivalled liquer used to be distilled until the silent Trappist Brothers were expelled and took refuge in Spain.

From Grenoble, a spin of another seventy-five miles takes us to Briançon, and sixty more to Turin. This is a route of fine views, with some of the most striking peaks of the Italian Alps continually in sight. Turin will be found a trifle warm in Summer, but the sensation of heat can be mitigated by taking a little glass of its well-known vermouth. The hundred-mile ride to Milan, also along the flat, fertile plains, may prove rather warm, but Milan itself will offer ample compensation in its numerous sights, its cool cathedral, and its airy and gay galleria. From Milan, a delightful day's trip should be made in the auto to the Certosa di Pavia.

Now you turn northward, and speed up to Como, perhaps the most captivating of Italian lakes. Next should come Lake Maggiore, reached on its western side at Pallanza, by way of another pleasing spot, Varese. Pallanza is a hundred miles from Milan. The great diligence highway of the Simplon, now just superseded by the new railroad, runs from Pallanza to Domo d'Ossola, whence we strike southwest again, by way of Biella, to Aosta, a hundred and sixty miles. Now begins some more fine hill roads, as the motor pushes on to Pré St. Didier, and then to one of the finest view resorts in the Southern Alps, Courmayeur. This mountain village, a favorite spot with Italians, beloved by the late Empress of Austria, but little visited by most American travelers, lies almost at the foot of the southern precipices of Mont Blanc, whose huge bulk, towering above the Allée Blanche between, is far more impressive as seen from this side than from Chamonix.

Finally, the route leads on out of Italy, high over the pass of the Little St. Bernard, and down through the French military post of Bourg St. Maurice, to Aix-les-Bains, a hundred and fifty miles from Aosta.

Some of the hills, especially those on the latter part of this attractive itinerary, are somewhat steep, and an anti-skidding tire and a powerful brake should be used in the descents. On the mountain routes the chauffeur should not indulge himself in high speeds at places where the prospect ahead is interrupted by sudden turns in the road. Carts and other slow-moving vehicles are constantly to be met or overtaken, plodding stodgily along, and one never knows what may be suddenly encountered.

Head Dressings of the Fair Autoist

Picturesque Scarf Hoods Are Popular and Effective.

TIME was, and not so many years ago, when the crumpled rose leaf that marred the happiness of the fair automobilist was the lack of wind-resisting headgear. Her cry to the milliners, "Make for me a hat that will stay firmly upon my head during a swift run and I will reward you with the half of my pin money," has finally been answered. So multiform, indeed, are the designs now seen in the shops that it would seem as though any woman—whatever her complexion, facial contour or apparent age—might readily find suitable motoring headgear.

Straws deserve first place at this season, and among the finer weaves are medium-sized shapes in brown, burnt orange and black, these of the modified English walking and boat order which will stand considerable trimming in the form of big buckles, coq plumes and wings. Such shapes are exceptionally becoming to women past their first youth or those having strongly marked features.

Coarse and fine straw braids employed alternately are most effective. This idea is pleasingly developed in the shape of a medium-sized navy blue boat hat, having a rather high, square crown with four distinctly blocked upper corners, and trimmed solely with braided strands of self-colored taffeta. Chiffon folds of the same tint with a black outlined satin border are draped about the crown from front to rear, then drawn forward and tied beneath the chin, so that trimming and veil are practically in one piece.

Because of the protection afforded by the omnipresent veil some exceedingly tiny hats are used for autoing. In this class are the miniature Alpines of fine and coarse natural colored straws, their deeply indented crowns and closely fitting brims trimmed with black velvet and black birds. These look immensely *chic* when perched upon masses of puffs and curls, as do also the envelope hats with their sharply upturned left brims distinctly outlined with a contrasting binding, and the little perky bows fluttering against the rather flat crown. Of the same order are the small fine straw hats, brimless at back and slightly pointed over the brow, that are bound and banded broadly with dark kid matching the small rosettes which decorate the crown and the bandeaux which tilt them ever so slightly to the right side of the head. Leather and kid bands and rosettes are a feature of the trimming of the

rougher type of hats, meaning those used for long and hard tours of several weeks' duration. In this event the trimmings match the strappings of the corded rep or rubberized pongee motor ulster.

Panama hats of modest dimensions and tailored finish are certain to be much worn during the Summer. Their popularity is largely due to the fact that they have flexible brims which may be rolled in whatever direction is most becoming to the individual face. They are trimmed in various ways. At present many Japanese scarfs are employed in their adornment. These are drawn loosely about the crown from brim almost to apex and knotted at the left side toward the back so that the fringed ends drop over the hair. When the inch wide bands are Yale blue, Harvard red, or whatever great university ranks most highly in the wearer's esteem, the ribbons are drawn tightly about the crown and secured invisibly, or they are joined with big black leather buckles which give rather a distinguished air to the hat. With the advent of really warm weather, these useful Panamas may be cleaned or bleached and decorated more seasonably with black, brown, or white chiffon choux and loops, supplemented with pretty dove wings.

Crowns are of diversified shape with the Tam O'Shanter version rather in the lead. This is owing to their non-crushable characteristics, and the fact that the narrow, slightly inverted brims render them wind resisting. Moreover, Tams require scarcely any trimming beyond the twisted silken band, which never gets in the way of the veiling scheme.

Satin motoring hats have come into being with the craze for fabric-covered headgear, and in their dip-brimmed, peak-crowned form are deemed immensely smart, particularly for use with the rubberized satin coats. They are usually decorated with yard-long scarfs of self-colored soft silk having deeply bordered fringed ends of contrasting hue, knotted in single bows at the left side, slightly toward the back.

Brimless turbans that dip at the back are not universally becoming, as there is nothing to relieve the outline severity at sides and front. However, they are considered ideal wind rebuffers, and with some women that is still the chief motive.

Visored caps similar to those worn by men are used almost exclusively by some women, as they are to be found in all the popular tints in pongee and mohair, in cloth plaids and mixtures, and in black, navy, tan and gray leather. Such shapes certainly lend a trim effect to feminine motoring garb, and the wide visor protects the eyes from the sun when no veil is worn.

Bonnets with brims slightly depressed over the brow are returning to favor with motoring headgear. In their present form they are a boon to elderly ladies whose dignity forbids them to adopt the frivolous looking Alpines and Panamas as well as the unspeakably co-

Travelling Veil Tied Four-in-Hand.

quettish toques so popular with the younger generation. Crush felts precisely like the "bush rangers" used for fishing and hunting excursions by the stronger sex are affected by very young girls who go in for the daringly unique. When they have poked their pink fingers into the high crowns

A Practical Garb That Is Serviceable.

to make them bowl shaped and tied the flapping brims over their ears with broad ribbons the effect of the improvised motoring hat is dangerously demure.

Little hoods which strongly resemble night caps are made of mohair, satin and kindred rubberized fabrics, and designed to be buttoned into the inner side of the hat crown and let down whenever it is desired to protect the hair and the ears from dampness. Their lower edges are doubly shirred upon a ribbon which ties beneath the chin and over this may be turned the coat's storm collar so that only a small portion of the face need be exposed to the elements.

Attachable hoods are exceptionally popular with both men and women. Some of them, arranged to entirely cover the hat, are friar shape, others are tight-fitting like a knight's helmet and vastly uncomfortable, despite a generous number of air holes. Practically the best hood is wired to stand slightly away from the head and provided with a waist length shoulder cape, so that when seated the wearer is well protected from the rain.

To drape the automobile veil in an eminently becoming and entirely adequate manner is a task "not to be undertaken lightly and unadvisedly." No matter what may be the size of the hat, the veil should be three yards long and at least half a yard wide. As every woman knows, the first mission of the veil is to become the wearer and the second to protect the face and hair from dust and sun. To do this the back as well as the front of the head must be thoroughly covered while one is riding, but the gauze so arranged that it may be thrown aside quickly. To effect this, the veil would best be in two distinct sections, joining for the space of a finger's length over the hat crown, the two back ends being brought forward and knotted beneath the chin, and the others crossed at the back and allowed to float at will.

Veiling materials were never more bewitching. The crepe chiffons and chiffon cloths which wear interminably are to be found in all the desirable colors finished with plain, hemstitched or embroidered borders. Some of them have self-colored satin borders attached with white or black chain stitching. These borders are of three types. One shows a succession of graduated stripes, another a half-inch edging surmounted by a four-inch band and a third simply the very broad edge.

Self-colored disks finish many of the new veils. They are often run across the ends merely and are of uniform size, or they entirely border it in rows ranging from nickel to half-dollar dimensions.

Plaided veils are in gauze, sewing silk and chiffon of various tones, but the preference is for brown of a reddish cast, which does not attract the sun's rays, and for gray of a pale tone, which is supposed to become the average complexion. Navy blue is also in high favor, and, like green, is considered restful to the eyes, but smartest of all are those veils of pure

white with wide borders of shaded tan or porcelain blue. The veil with a mica mask is worn by numbers of enthusiasts. This mask is about four by sixteen inches in size and set into the chiffon veil with machine stitching.

Picturesque Scarf Hoods.—Rainproof satin is much employed for the voluminous scarf hoods used as storm protectors of small hats worn with the English plaided tweeds and mixtures, as well as with the lighter rubberized fabrics. These hoods are of full width satin, shirred on a rubber band and drawn over the head, closing beneath the chin with shirrings and large buttons, whence the ends fall over the shoulders or to the waist. Chiffon mask veils, shirred across the front of the hat, fall loosely over the face.

The "Bride's" Traveling Veil.—Women who eschew the all-enveloping motoring coat in favor of the trimly tailored mo-hair or serge coat and skirt costume of the fashionable chevron stripe effects are adopting the enormously long and wide bridal motoring veils. These are usually of the handsome satin bordered white, gray or champagne chiffons, three by one and a half yards in size. One side is so draped over the front of the hat that it will protect the neck, and the remainder over the back of the hat, the ends crossed at the nape of the neck, then drawn loosely forward and knotted four-in-hand manner below the throat. When not in the car the wearer allows the veil to flow loosely from the back of the hat precisely as does the conventional wedding veil.

Practical Automobiling Garb.—Clan plaid silk, rubberized, is extensively used for automobile coats, which in their latest development show the singly box-plaited back, the narrow side gores and the wide arm-sized sleeves, slightly gathered all around. Broad biased bands simulating round yokes, punctuated with silk-covered, metal-bound buttons are much in vogue and turned-over collars and turned-back cuffs are deep and pointed rather than straight. With the dark-toned clan plaids are worn bordered chiffon veils matching the grounding of the coat. The veil pictured is side plaited at one end, drawn in over the crown's top toward the back and secured by the shaped straw band. The remaining end is then drawn from left to right over the face and attached to the back of the hat.

Adaptability of the Duplex Veil.—In no way is the duplex of four-ended veil more valuable than when it is necessary to veil a hat of unique shape, such as the pictured modified Gainsborough with irregular brim and dented crown. The joining shirring of the rear section is brought to the front of the crown and the ends drawn over the ears and knotted beneath the chin, while the forward section is draped over the face and the ends crossed at the back, thus firmly securing the hat. In this instance the natural colored straw of the hat matches the hue of the satin insets of the collar and cuffs of the taffeta coat.

Readily Adaptable Duplex Veil

MAINE BUYING AUTOMOBILES.

PORTLAND, ME., May 18.—Automobiles continue to grow in popularity in Maine, and it is now estimated that there are cars enough in the State, owned here and registered at the Secretary of State's office in Augusta, to represent an outlay of considerably more than \$2,000,000. The total number of automobiles which have been registered in Maine since the law went into effect in 1906 is 2,443, and the number since the beginning of the current year, up to May 1, is 205. The total number of operators' licenses issued since the law went into effect is 2,847, and the number during the current year 215. The total number of motorcycles registered in the State is 259 and the number registered to date in 1908 is 31.

The movement for good roads in Maine is going steadily along, and from all indications, the stretches of bad places in the State's highways will in a few years be wholly eliminated. Visitors from outside of Maine are already remarking upon the improved condition of the roads. Highway Commissioner Paul D. Sargent of Augusta has been holding a series of meetings at many points about the State where the good roads question has been discussed. Farmers, selectmen and others interested have never failed to attend these meetings in large numbers and good results have always followed. The meetings are of an educative nature, open to discussion and many valuable points on road building and the construction of State roads have been gained in the course of his instructive campaign.

By a law of the State, any town may receive an appropriation for a State road, provided it will also appropriate a sum for the building and maintenance of it. The city of Portland the present year will receive \$200,000 and a road has been laid out that will be on the direct route of tourists going through the State to points on either border.

SLIGHT DECREASE IN MARCH EXPORTS.

Though the value of the automobiles and parts exported from this country during the month of March, 1908, is slightly less than that of the corresponding month of 1907, the figures being \$545,347 for the latter, and \$539,388 for the present year, statistics issued by the Department of Commerce and Labor show that the gain during the past three years has been very steady and substantial. For the nine months ending with March, 1906, the total was \$2,064,874; in 1907, this increased to \$3,418,593, while the present year's figures are \$3,601,211. A noticeable feature of the returns for the month of March, 1908, is an increase in the value of automobile parts exported from \$51,922 in 1907, to \$72,941. Despite the drop in the total, substantial increases are apparent to such automobile manufacturing countries as Great Britain, France, and Italy, the English imports advancing from \$146,621 to \$156,820, while the French took \$81,083, as compared with \$65,813 the same month a year previous, and Italy's total jumped from \$27,024 to \$45,842.

THIS FARMER USED AUTO TRUCK.

HARTFORD, Conn., May 18.—Even the farmers are taking to automobiles for utility purposes. A case in point is that of a truck gardener of a small town a short distance from Hartford. He uses a two-cylinder air-cooled Knox truck and hauls a load of produce that would put a horse to shame. The roads traversed are very good, so he has nothing to fear in this direction. Speed is a factor in that it makes a lot of difference whether he reaches the city market early or late, and with the truck he gets there in less time than was formerly necessary for the horse outfit.

"TAXILESS" TAXIMETER LATEST DEVELOPMENT

To meet the tremendous demand for taxicabs now existing in New York City, taximeters are being stuck on all kinds of cars, but the most amusing development noted was an improvised "taxi" on which the meter had no driving connection.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
- Dec. 31-Jan. 7....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
- January, 1909....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
- February, 1909....—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Race Meets, Hill Climbs, Etc.

- May 23.....—Albany, N. Y., Hill Climb, Albany Automobile Club.
- May 30.....—Boston, Readville Track, Race Meet, Bay State Automobile Association.
- May 29-30.....—Minneapolis, Minn., 300-mile Endurance Run, Minneapolis Automobile Club.
- May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
- May 30.....—Wilkes-Barre, Pa., Giant's Despair Hill Climb, Automobile Club of Wilkes-Barre.
- May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers' Association.
- June 5.....—Jamaica, L. I., Straightaway Time Trials, Long Island Subway Celebration Committee, assisted by Long Island Automobile Club.
- June 6.....—Worcester, Mass., Dead Horse Hill Climb, Worcester Automobile Club.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- July 4.....—Lowell, Mass., 240-mile Road Race, Lowell Automobile Club.
- July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
- July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
- Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-31.....—Austria, Budapest Automobile Show.
- May 17-June 2....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.

POPULAR VOGUE OF THE TAXICAB.

What has been constantly predicted for the automobile for several years has now come to pass. The taxicab has arrived. True, there have been more or less evidences of the gasoline-driven public service vehicle during the past year, particularly in New York City, but both the pioneers as well as a very large percentage of the cars that have been in use from the first have been of foreign origin. Now the American maker has awakened to the possibilities of the town type of vehicle for either public or private use, and it is safe to say that there is scarcely an established American manufacturer to-day who has not tried his hand at turning out a few taxicabs.

Some of these did not require any great exertion on the part of their makers, to be sure, as they represent nothing more than one of the latter's stock chassis with a very much ready-made-looking landaulet body perched upon them. Others are special designs throughout that represent a great deal of work and study devoted to the problem of turning out a vehicle for this most strenuous form of service.

As conditions are at present, it is possible to reap large gross returns from the running of anything in the shape of a power-driven cab, but it is evident that only the vehicle which is built for this service can stand the racking and show a net return on the investment at the end of the year. For which reason, it is further apparent that many of the improvised cabs now running will fade

from view before long and only those of sufficient merit to stand the test will prove dividend payers in the end. However this may be, it is certain that the present vogue of the taxicab will result in popularizing the automobile, to a greater extent than could possibly have been done in any other way in the same period of time. A highly interesting development in connection with these little vehicles has been their official inclusion in the commercial vehicle tests now being held in France. On this occasion they are being limited to alcohol as fuel.

ALLOY STEEL FOR AUTOMOBILE TOOLS.

A manufacturing opportunity that it is somewhat surprising accessory makers have not taken advantage of, concerns the demand that it would seem might be created for alloy steel tools. No automobile user of experience needs to be told that any investment in cheap tools is likely to be money worse than thrown away, nor does he fail to realize that the attainment of the highest possible quality in many of these useful articles is a problem as exacting in its demand as anything in the whole range of engineering.

Take the screwdriver, for example, on which ordinarily falls the brunt, not only of the most exacting sort of legitimate chiseling, wedging, punching, and driving operations, to which even the careful mechanic is sure to be forced by stress of circumstances to put it sooner or later. This tool in its width and thickness of blade is closely limited by the conditions of its normal use. Obviously, then, the only recourse is the objectionable and awkward sets of screwdrivers of many different sizes, or else the utmost possible improvement in the quality of the steel, which suggests at once that the finest alloy steels are none too good for an article that is now commonly made of altogether inadequate tool steel. What is true of the screwdriver applies equally to other tools, such as wrenches, spanners, and the like, the number necessarily carried making the matter of weight reduction alone an item of importance.

AUTOMOBILING'S WIDESPREAD ADVANCE.

When one glances through the list of events scheduled from one end of the country to the other—here an endurance contest, there a hill climb, and somewhere else a high speed race—he more accurately appreciates the widespread progress of the pleasurable necessity in these United States. Once upon a time to have suggested that soldiers in uniform could be utilized to guard the pathway for an automobile road race would have brought forth derisive smiles and prompt refusal. When one reads that in Massachusetts, Connecticut, and Pennsylvania hill climbs are scheduled with military guarding, and even in far away Oregon a road race is to have soldier-boy policing, and then, with Savannah still fresh in mind, the conviction is driven home that the battle of the automobile is practically won and its future progress will be attended with a great deal less opposition than has been shown during earlier and more unreliable periods. Certainly the motor-driven vehicle is demonstrating the reason of its being just as rapidly as the manufacturers distribute their product, which now finds equally great demand in city and country.

VANDERBILT CUP RACE SEEMS CERTAIN ON LONG ISLAND

THE next Vanderbilt Cup race seems certain to be run on Long Island. This fact became known through press dispatches from Worcester, Mass., telling of the awarding to the Hassam Paving Company of a contract for the building of a 60-mile stretch of roadway for the Long Island Motor Parkway, Inc., the completion of 10 miles of the roadway by October 1 being made a part of the contract.

When the bids of Savannah and other cities for the race have come up for discussion, Chairman J. D. Thompson, of the A. A. A. Racing Board, has invariably stated that it would be the policy of himself and his associates to hold the race near New York, provided that a course, either fenced in or guarded by soldiers, could be secured. The Racing Board, in announcing the rules for the Vanderbilt race, embodied in its bulletin the statement that the date and course would be announced on or before July 1. The chairman now reiterates this statement.

It can be safely assumed that adjoining roads will be made use of to enable the employment of whatever straightaway stretch of the Long Island Parkway may be available for the race. All statements as to the location of the stretch to be

used, the details of its arrangement for racing purposes, and the building of loops for making the turns at either end, are, of necessity, at present mere guesswork.

To hold the Vanderbilt Cup race in the metropolitan district is generally considered logical and desirable. It had its origin in New York. The donor of the trophy competed for is a New Yorker. The representatives of the foreign cars, which comprise a majority of the contending forces, are also centered in New York. The metropolis of the country is its most important news center, and able to give to the contest the greatest possible publicity. In view of all this, it is naturally a matter of general gratification to learn that a course appears to have been finally secured on Long Island, the world-famed arena of former contests for the Vanderbilt Cup.

The figures supplied by Capt. William E. Hassam, of the company, place the total of the contract at \$2,000,000. In rushing the 10-mile racing stretch to completion, he says that 30 carloads of cracked rock a day will be required. The contract was awarded following the laying of a sample stretch of roadway on Mr. Vanderbilt's Long Island estate.

FRANCE'S PROTEST OF VANDERBILT RULES.

Automobilists interested in racing, who are in a position to understand the ins and outs therewith involved are somewhat amused at the evident purpose of a certain A. C. A. contingent to "aid" the Vanderbilt Cup Commission in securing entries for the big American race.

Assuming to act as correspondent of the A. A. A. in the somewhat loosely organized international association of clubs, the A. C. A. failed to notify the national body that it had been obligated in any way to conduct the Vanderbilt race according to so-called international rules.

It is also a matter of record that A. L. Riker, a member of the A. A. A. Racing Board, deputized by that committee to consult A. C. A. official records, reported that he could not discover any correspondence whereby that club had bound the A. A. A. to observe international rules in the conduct of the Vanderbilt event. In view of the fact that Mr. Riker is a member of the contest committee of the A. C. A., his report was accepted without question.

Though failing to supply any information concerning the meetings at Ostend and Paris, the A. C. A. contest committee, of which Robert Lee Morrell is the chairman, gives widespread publicity to a letter of protest from the Automobile Club of

France, taking exception to the "failure" of America to observe the so-called international rules to which the A. C. A. obligated (?) the A. A. A. in the running of the Vanderbilt race by its cup commission. Mr. Morrell also supplies for publication a copy of his letter sent to Jefferson deMont Thompson, chairman of the A. A. A. Racing Board and the Vanderbilt Cup Commission, notifying that official of the protest from France, and asking for prompt reply.

Interviewed, Chairman Thompson is quoted as follows:

"The Vanderbilt Cup Commission adopted its rules, with a full knowledge of the situation on the other side of the Atlantic, for reasons which seemed sufficient to it, and which were acceptable to the donor of the cup, W. K. Vanderbilt, Jr.

"I cannot exactly understand the reason for the Automobile Club of France making a protest. The club has had no official connection with the Vanderbilt Cup race for two years, and refused then to name an official team for the race. The entries that we had for the race were received from independent manufacturers and were made as individuals. The same is true of last year, when we had a number of entries for a race, and had to send them back. It will be true again this year. The status of the Automobile Club of France in the matter I fail to see, therefore. The rules are fixed, and will remain unchanged. The letters will be called to the attention of the Racing Board as a matter of courtesy merely. I also fail to understand why the protest mailed in France on April 18 should be delayed so long in reaching us."

THOMAS, PROTOS AND ZUST ONLY REMAINING SURVIVORS

CABLES from Vladivostok to the *New York Times* are to the effect that everything was in readiness for the start across Siberia, to take place on Wednesday, May 20, these late advices also stating that the Zust will start with the Thomas and Protos. The Trans-Alaska-Siberian railroad has offered a prize of 5,000 francs to the car first to reach Tchita, while a similar prize has been offered by the Russian Automobile Club to the car first to reach St. Petersburg.

In addition to the confirmation of the announcement previously made that the De Dion car would be withdrawn at Vladivostok, it is now stated that the Zust has been formally withdrawn from the round-the-world race, thus leaving the American and German cars the two remaining contestants. Under the terms of the arrangement recently decided upon by

the French committee, the Germans have to allow the Thomas thirty days, so that while both will undertake the Siberian trip together, the Protos will be a month behind in point of time.

According to a cable to the *New York Times*, the Thomas car arrived at Tsuruga, Japan, en route for Vladivostok on Friday last, May 15, after a two-days' trip across the island.

Godard Tells "Wonderful" Tales in Paris.

PARIS, May 10.—Another of the "brave" New York-Paris drivers has returned home, and is now thrilling his compatriots with stories of adventures in the wilds of the United States. Though he may not have seen much to the west of Chicago, Charles Godard has no lack of stories to relate on the round-the-world tour, which he and his Motobloc undertook so joyously. Stripped of their verbosity, they amount to "bad roads, bad food, scant hospitality."

How Dreamland Rink Was Utilized by the Automobile Dealers' Association of Seattle, Wash., for Its First Show, April 22-25.

TO HAVE MILITIA-GUARDED RACE.

PORTLAND, ORE., May 12.—During the Rose Festival week, which is an annual event here, Portland is going to show the country that successful road races may be held on the Coast, as well as in the East. Thursday, June 4, is the date set for the event, which is to be a 100-mile run of 7 laps, the latter measuring 14 miles each. There will also be a 50-mile race over the same course. Up to the present writing, there are no less than 56 entries for the big event, the majority of the cars being entered by the local representatives of the manufacturers, though there are a few private cars in addition.

E. Henry Wemme, a pioneer autoist of this city, has offered a \$500 silver cup to the winner of the 100-mile race, which will be run under the auspices of the Portland Automobile Club. The course will be effectively guarded by the Third Regiment, Oregon National Guard, under command of General W. E. Finzer and Colonel Charles N. McDonnell. The soldiers will be armed and in full uniform, and the Oregonians are setting out to show the country and the world at large that they know how to hold a big event by providing proper protection.

The course lies through a most picturesque bit of country adjacent to the city, comprising two of the main roads lined with fruit farms and suburban residences. It is a section easily

reached by the interurban service of the street car lines. Eastern drivers and agents now here, who have seen the Vanderbilt and Briarcliff courses, say that the roads selected here are equal to anything that has been used for the purpose in the East. There are quite a few sharp turns that are dangerous, but the work of widening the road at these points and providing a proper banking has already been undertaken.

The start and finish are to be at a grandstand two miles from the Twelve Mile House, which is run by Fred T. Merrill, an old-time bicycle rider. This stand is being erected by the Portland Automobile Club and is to have a capacity of 5,000 people. The course runs through Russellville and Gresham, but no controls will be required. It includes one six-mile stretch of perfect straightaway that is the finest roadway to be found anywhere in the West. Owing to the manner in which the land is laid out in sections, the course is practically a square along the base and section line roads. But in spite of this feature, it possesses the usual characteristics of a road racing course, in that it has a typical "S" turn, located immediately east of Gresham hill, and one or two very bad corners, the worst of which is situated where the Base Line road leads into the Russellville thoroughfare, while there are also several hills.

The Wemme Cup is offered for competition, and must be won three times in succession.

The "S" Turn on Section Line Road near Portland, Ore., which Will Test Chauffeurs' Skill and Nerve.

Climbing "Jacob's Ladder," in the Berkshires, a Hill Famous for Strenuous Experiences Among Automobilists.

FROM ALBANY TO BOSTON IN ONE DAY ON THE A.A.A. TOUR

By LEON MYRON BRADLEY.

AFTER fifteen days of mud plugging, climbing mountains, plunging through small streams, making detours to escape steam rollers and torn up roads, filling up ditches with rocks, fence rails, and planks, and also speeding over mile after mile of the famous highways of Massachusetts—the Premier Pathfinder has laid out eight days of the 1908 A.A.A. tour, making a total of 1,059.5 miles, the odometer, however, showing 1,361 miles. The difference is the distance traveled by the Premier on wrong roads, etc. The eight days as now laid out are:

First day—Buffalo to Cambridge Springs.....	117.4 miles
Second day—Cambridge Springs to Pittsburg....	110.2 "
Third day—Pittsburg to Bedford Springs.....	106.4 "
Fourth day—Bedford Springs to Harrisburg.....	107.3 "
Fifth day—Harrisburg to Philadelphia.....	133.5 "
Sixth day—Philadelphia to Milford.....	132.0 "
Seventh day—Milford to Albany.....	158.5 "
Eighth day—Albany to Boston.....	194.2 "

The Pathfinder had laid out a route from Harrisburg to the Delaware Water Gap eliminating Philadelphia when ordered back to Harrisburg, a distance of 130 miles,—to lay out a new route from that city to Quaker Town.

The fifth day's run of the tour as mapped out will undoubtedly be one of the easiest of the whole tour. Leaving Harrisburg the route is along the Susquehanna river to Steelton and past the Steelton mills and furnaces and by the mammoth Pennsylvania Steel Works. The fifth day's run was the first that the six-cylinder Pathfinder was enabled to make any fast time, and it

was photographed beside a six-mule combination. It was the first day that we were blessed with sunshine since leaving Buffalo. The roads are excellent and are practically macadam the entire distance with the exception of a few stretches of clay. The clay road, however, is in excellent condition and fast time can be made by the contestants. The route selected is zigzag. It includes Marietta, Lancaster, Reading, and Pottstown, and is far superior to that which was laid out direct from Harrisburg to the "Gap." There are practically no hills to speak of, and the only drawback is over the Marietta-Lancaster pike, where many water-breakers predominate and about one-half dozen toll-gates will be passed through. The rubber raincoats, sweaters, and other heavy clothing were packed in the suit case, and replaced by the lightest of clothing and dusters. A limit of six or seven hours will probably be the maximum of this day's run. The tourists should begin to arrive at Philadelphia about 2 o'clock, which will give them ample opportunity to rest. The Quaker City Motor Club is enthusiastic because Philadelphia has finally been chosen as a stopover. The club's headquarters are in the Walton, where the tourists will remain over night and be entertained with a smoker.

One of the most picturesque runs is that between Philadelphia and Milford. This will take the contestants through Allentown, Bethlehem, Nazareth, Easton, and through the Gap. There are a variety of roads, but macadam predominates. The mud-plugging trip at this point turned into a dust-eating one, as very

Picturesque Country After Leaving Port Jervis, Near Unionville, N. Y., en Route to Goshen.

Coming Up Butterback Mountain in the Catskills.

little mud was found, but much time was lost in crawling over recently laid trap rock, dodging steam rollers, and mule teams loaded with road-making material. The scenery through this part of Pennsylvania will well repay the participant in the tour for his trouble. Few spots in America vie with Delaware Water Gap in picturesque effect, and the mountainous surroundings are complete in harmony and effectiveness. Much has cer-

Both Pathfinder and Occupants Stop for Drink.

tainly been gained by the decision to go around New Jersey instead of across.

From Philadelphia to Three Churches, a distance of 93 miles, the tourist will find some of the best highways in Pennsylvania. It is said that all the roads which are now torn up and in process of construction will be finished before the tourists arrive in this section. Several stretches of brand new macadam will have no water-breakers, but on the Allentown pike from Philadel-

Almost Stalled in the Mud Near New Baltimore, N. Y.

phia there is a great quantity of them. On this pike there are eight or ten toll-gates, the tolls ranging from 3 to 10 cents. If the route book is not closely followed, many of these toll-gates are liable to be overlooked, due to the smallness of the signs which are set in inconspicuous positions.

At Easton the course lies parallel with the Delaware river which is followed much of the way to the Gap. Three Churches is on a hill, and from it the Gap can be seen seven miles away, with beautiful intervening valleys. The scene is inspiring, and at each leap of the big six-cylinder the scenery grew better and more beautiful.

From Portland to the Gap, a distance of five miles, the road becomes very narrow and winding. On one side are great tow-

Approaching "Jacob's Ladder" in the Berkshires.

ering mountains with overhanging cliffs, while on the other is the D., L. & W. R. R., then the Delaware river, and beyond are other peaks. The two highest peaks which form the gap are Mt. Minsi and Mt. Tammany.

There is no question but that the run from Milford to Albany, a distance of 158.5 miles, will be one of the most trying

Longfellow's "Wayside Inn" at Sudbury, Mass.

of the fourteen days' contest. Up to Boston it is the hardest yet laid out. The principal towns through which the route goes include Port Jervis, Middletown, Goshen, Newburg, Kingston, Saugerties, Catskill, and Athens. The roads from Milford to Albany are over a combination of macadam, clay and dirt, interspersed with many twists and turns and steep hill climbing. The only speed trap which the Premier Pathfinder has encountered since leaving Buffalo is a mile south of Port Jervis after leaving Milford. At Milford we were warned by hotel proprietors and others that an obnoxious constable scoured two dollars for each arrest over the best macadam roads between Milford and Port Jervis. Heeding the warning we crawled at a snail's pace over this course and were not bothered.

At Port Jervis the regions of oil, coke, coal, and steel were left behind, and the great Empire State was entered. It was with a thrill of joy and satisfaction that the terrible roads of Western Pennsylvania, which we had ploughed through for over a week, were a thing of the past. After leaving Cutterback, mountain climbing was renewed and continued to Otisville for four miles. This is one steady climb with many sharp and dangerous "S" and hairpin turns. The roads are rocky and very narrow.

At Newburg the Hudson river comes into view, and it is unquestionably the grandest river that will be seen by the contestants. It was our intention to cross the river from Newburg and continue through Poughkeepsie to Albany, but upon reaching Newburg we found the only way to cross the Hudson was by ferris, and, as this would necessitate a delay to the tourists, it was finally decided to continue on the west shore. A noticeable thing which was brought forcibly to our attention in New York State was the utter lack of signboards and a great quantity of forks and crossroads. In this respect Pennsylvania is far superior to the Empire State. Many hours were lost in New York State groping our way about on country roads, stopping the car, and inquiring the way from farmers and team drivers.

When Port Ewen was reached, 11-2 miles from Kingston, the ferry proposition again cropped up, which necessitated a detour of five to six miles into Kingston. The roads up to Kingston were in very good condition, but after leaving Kingston the roads were as bad, and in some places worse, than anything the big Premier had ploughed through. Water was running in rivers by the roadside, and the soft clay roads were nearly impassable. We were warned by farmers that the roads were in fearful condition, and one of them jokingly made the statement that he would bet his best team of horses against the Pathfinder that we could never reach Albany. Like the farmers of western Pennsylvania, those in this part of the country "repair" the roads by throwing the sod into the middle of the highway, leaving it there to be trampled down by the traveler.

In the vicinity of New Baltimore we were ditched for the first time. For two hours we worked at filling up the ditch with rocks, rails from the nearby fences, and boards borrowed from a farmhouse a half a mile away. For a time it looked as if nothing but horses could get us out of the quagmire. But by stubborn persistency driver McNamara landed the car at the top of the hill. Chains were of little use in the soft clay, and the rear wheels spun around inside the chains.

Between Kingston and Albany the Catskill mountains were continually in sight on one side, while the beautiful Hudson was on the other.

There are two predominating features of the eighth day run

Where the Delaware River Forges its Famous Water Gap Through the Blue Mountains.

from Albany to Boston, a distance of 194.2 miles. Albany is left by driving over the drawbridge and into Rensselaer. The contestants are liable to be held up some time at this drawbridge, and the Premier Pathfinder had to wait about 20 minutes. For eight miles the route is over macadam roads and then over common dirt and clay roads. A direct line is taken to State Line, into Massachusetts. If for no other reason, the Pathfinders knew they were in Massachusetts because of its beautiful State highways. With the exception of a stretch of about five miles in the vicinity of Jacob's Ladder, the finest roads in the United States are gone over.

There are few tourists who do not know of the beauty of the Berkshire hills. There seems to be something totally different in the Berkshire scenery as compared with that of the Allegheny regions. The route from State Line to Boston is considerably different than that generally used by autoists. It leads through West Stockbridge, Stockbridge, East Lee, Chester, over Jacob's Ladder, Huntington, Fairfield, Westfield, West Springfield, across the Connecticut river into Springfield, Wilbraham, a detour of six miles to Three River (due to road

Near State Line, Which Marks the Boundaries of New York and Massachusetts.

construction through West Brimfield), through Brimfield, Warren, the Brookfields, Spencer, Worcester, Shrewsbury, Northboro, Marlboro; Sudbury, past Wayside Inn, made famous by the poet Longfellow; Wayland Weston, via Commonwealth Avenue to Hotel Somerset, where the night will be spent.

The Premier Pathfinder was met at the Worcester Automobile Club by Manager Johnson, of the Premier Boston branch, and J. C. Kerrison, of the Bay State Automobile Association. At Norumbega Park a delegation of three cars was lined up along the roadside awaiting the Pathfinder car. The four cars piloted us to the Hotel Somerset.

It is probable that the run from Boston will include the famous North Shore drive through Prides Crossing, Manchester, Magnolia, Gloucester, around Cape Ann and north to Portsmouth, N. H., Portland, Me. While the route will take the Pathfinders through New Hampshire and Vermont, with a probable finish at Saratoga Springs, New York, or Buffalo, it is not possible at this time to state what will be the exact route.

BIG PRIZES FOR SPORT HILL CLIMBERS.

BRIDGEPORT, CONN., May 18.—Preparations for the annual hill climb of the Automobile Club of Bridgeport, which will be held on Sport Hill May 30, are complete. The course will be guarded by soldiers, and the speed flights will be recorded by an electric timer. The value and importance of the prizes for the star events on the card promise to attract a noteworthy field of crack climbers. The Board of Trade cup, which has been dubbed "the local pride trophy," will be awarded to the winner of the free-for-all. The Robert B. Crauford cup will go to the successful owner, who must also be a pilot, in the amateur class. Henry D. Miller, vice-president of the Bridgeport Vehicle Company, builder of bodies, has also put up a trophy. It will be raced for in the class for cars listing over \$4,000.

An executive committee, made up of Ralph M. Sperry, Frank T. Staples, and F. W. Bolande will have charge of the climb.

ALBANY CLUB TO HOLD HILL CLIMB.

ALBANY, N. Y., May 18.—At the regular monthly meeting of the Albany Automobile Club, which was held at the clubhouse, 375 State street, last week, the conditions governing the 1908 sealed-bonnet contest for the McClure cup, as decided by the committee, were passed upon. All entries must be in by June 13, the fees being \$3 per car and \$1 per passenger. The route will be the same as that of the fourth annual tour of the club, and the running time each day will be from 9:30 A.M. to 5 P.M. John P. Randerson is chairman of the McClure cup committee, and the event is limited to members of the club.

The club will hold its first hill climbing contest May 23, on Menand's hill, the entry fee being fixed at \$2. Twelve events are scheduled, and a silver cup will be awarded to the winner in each. The classes include runabouts selling from \$1,250 or less, to \$2,500; free-for-all runabouts; touring car events for cars selling from \$850 or less, to \$3,000; six-cylinder cars; steam touring cars, and a free-for-all touring cars.

TO HUNT JERSEY'S GRAFTING JUSTICES.

NEWARK, N. J., May 19.—Believing that graft is at the bottom of not a little of the holding up and fining of automobilists by county constables and justices of the peace for alleged speed violations, the New Jersey Automobile and Motor Club will shortly begin a still hunt for the grafters. There is more than a mere impression prevailing that these rural minions of the law fail to make return of the full amount or all of the moneys paid over to them for fines and costs for alleged breakages of New Jersey's comprehensive laws. The inducement to make arrests and impose fines with such an object in view is manifest.

A. B. Le Massena, the club's secretary, has hit upon a clever means of tracing these defalcations. He is preparing cards to be sent to the members of his and other clubs, with the request that in case of an arrest and fine the cards be filled out, giving the full particulars of the case and especially the amount of the fines and the costs paid. The information will be confidential. At intervals Mr. Le Massena will go to Trenton and look over the records of the Department of Motor Vehicles comparing his reports of money paid with the amounts actually turned over to the State. Whenever there has been a withholding of the money, the club will wait for the expiration of the time limit, and then start criminal prosecution under the law making the withholding of the money a misdemeanor.

TO STUDY WORKINGS OF BAY STATE LAW.

CLEVELAND, May 18.—To illustrate the thoroughness with which the Ohio State Automobile Association is taking up the work in connection with the new motor vehicle bill, may be mentioned the fact that C. J. Forbes, Jr., secretary of the Cleveland Automobile Club; Secretary of State Carmi Thompson, and State Registrar of Automobiles Galey have left for Massachusetts to study the workings of that State's bill. The Ohio measure was modeled after this bill, and the local authorities figure that the best thing they can do is to study the actual working of this measure. In the neighborhood of a week will be spent in the East by the three men. It is also probable that Mr. Forbes will go on to New York to see officers of the A. A. A.

LELAND'S STEARNS WRECKED AT SAVANNAH.

SAVANNAH, GA., May 18.—The No. 7 Stearns car that Leland drove in the races here in March last went into a ditch at high speed on a part of the course not far from the city line last week, and Ross Geurard, who was at the wheel, as well as the three friends who were with him in the car, had a very narrow escape. No one was injured, outside of a miscellaneous collection of bruises which did not require a surgeon's attention, although a telephone message had quickly brought an ambulance, a corps of detectives and the chief of police to the scene.

Sport Hill, Bridgeport, Conn., and Adjacent Roads.

WHAT IS GOING ON AMONG THE CLUBS

JOYCE OF MINNESOTA DESIGNS EMBLEM.

MINNEAPOLIS, MINN., May 18.—President Frank M. Joyce, of the Minnesota State Automobile Association, is responsible for the designing of an emblem that ultimately may be adopted by all the State associations of the A. A. A. The emblem combines the names of the National and State associations, and also the name of the city where the club is located. It is particularly fitted for use on the radiator, though it can be otherwise shown on the car if desired. The displaying of an emblem of this character by all the automobilists throughout the country unquestionably would call attention to the magnitude of the national body and the existence of State associations and local clubs. President Joyce was recently re-elected as the head of the Minnesota State Automobile Association, which is in a most flourishing condition and gaining rapidly in membership and influence.

GRAND RAPIDS CLUB ALIVE AND PROGRESSIVE.

GRAND RAPIDS, MICH., May 14.—A few irresponsible automobile drivers are putting the Grand Rapids autoists in such ill repute that the club at its last meeting decided to try a new plan to stop reckless driving. Instead of leaving the matter entirely to the police, it was decided to appoint a "police" committee, consisting of three prominent men, to investigate the cases reported, and, if the evidence warrants, they will swear to the complaints personally.

Active preparations are being made by the club for the entertainment of the visitors at the State convention of the A. A. A., which is to be held here during the last week in May. A delegation from Grand Rapids will go to the Buffalo convention in July. The membership of the club at its last meeting was reported as 214, and a strong effort will be made to reach the 500 mark.

LOWELL CLUB'S RACE TO BE 250 MILES.

BOSTON, May 18.—The Lowell Automobile Club has decided to lengthen its Fourth of July race from 200 to 250 miles. The following chairmen of committees have been appointed: Patrolling the course, Captain Gardner W. Pearson, company C, Sixth regiment, M.V.M.; publicity, Frank S. Corlew; finance, Humphrey O'Sullivan; course, Harry H. J. Read; transportation, Charles J. Wier; program, Burton J. Wiggin; hospital corps, Dr. J. A. Gage; options for racing camps, Jesse H. Shepard. Entries expected include Thomas, Apperson, Stearns, Renault, Panhard, Bianchi, Simplex and Lozier. The club will provide racing camps and otherwise take care of the racers. Alonzo G. Peck, of Boston, the veteran race starter, will be asked to officiate as starter.

WILDWOOD IN JERSEY TO HAVE STRAIGHTAWAY.

WILDWOOD-BY-THE-SEA, N. J., May 18.—At the annual meeting of the Motor Club of Wildwood, held last Wednesday night, authority was given the contest committee to go ahead with preparations for the usual Fourth of July speed tournament on Central avenue boulevard. The annual election resulted in the choice of Philip P. Baker, president; Evans G. Slaughter, vice-president; V. G. Reynolds, secretary; J. Thompson Baker, treasurer; H. L. Hamersley, racing secretary; Thomas S. Goslin and John Bright, trustees.

YORKERS OF PENN. ARE BUSY THESE DAYS.

YORK, PA., May 18.—The York County Automobile Association at its annual meeting decided to have an endurance run and races for members, and agreed to assist ten autoists, who were arrested for scorching, in their fight at court. It was the largest attended and most enthusiastic meeting ever held by the association, and every member was loud in his denunciation of Constable Doll, who has made himself conspicuous by prosecuting ten autoists for exceeding the speed limit on the famous Gettysburg turnpike leading to the Gettysburg battlefield.

Thirty-eight new members were elected, and there were fifty applications for membership received. John Kissinger, of this city, announced that the *Gazette* had offered a cup to the winner of an endurance run to be started from this city, and it was decided to have such a contest later in the summer. Stuart B. Lafean, son of Congressman D. F. Lafean, who has gained a reputation as a race driver, was made chairman of the committee on tours, races and contests. Thomas J. O'Neil, of Hanover, and Thomas Myers, of York, are the other members of the committee. The association decided to hold a tour to the Hanover Country Club at Waldheim on May 24.

BROOKLYN TO CELEBRATE ORPHANS' DAY.

BROOKLYN, N. Y., May 20.—The Long Island Automobile Club's Orphans' Day committee has proved a hustling one. It has chosen Wednesday, June 10, for the annual auto outing for the children of Brooklyn's orphanages. Luna Park will again throw open its doors to the little ones. The Messrs. Feltman, who last year provided an excellent luncheon at cost, have generously offered this time to feed 800 children free. This was the number taken care of last year. The committee wishes this year to provide for 1,400, and has sent out return postal cards, asking that members authorize the treasurer to charge their accounts with \$2 each to feed the added 600. The committee is made up of Frank G. Webb, chairman; Charles C. Cluff, W. P. Richardson, Louis T. Weiss, and W. T. Wintringham.

SCHENECTADY CLUB TO TOUR TO BUFFALO.

SCHENECTADY, N. Y., May 19.—Club tours are now occupying much of the attention of the Schenectady Automobile Club. At its last meeting it was decided to have a run to Buffalo in July to attend the Good Roads and Legislative Convention, and be present also at the start of the Glidden tour, whose participants will also be met by a club caravan at Saratoga. Arrangements for a run to Saratoga on May 31 were also made. Twenty members will make the trip.

BALTIMORE PREPARING FOR ORPHANS' DAY.

BALTIMORE, May 18.—Arrangements are being made by the members of the Automobile Club of Maryland for the annual Orphans' Day automobile outing, June 10. C. Howard Millikin, chairman; Dr. H. M. Rowe and Frank W. Darling, the committee in charge of the outing, through E. A. Dolle, secretary of the club, have sent requests to 1,149 automobile owners in Baltimore and vicinity, asking them to loan their autos that day.

TWIN CITIES IN OHIO ORGANIZE CLUB.

UHRICHSVILLE, O., May 19.—The Twin City Automobile Club was organized last week. It embraces Dennison and Uhrichsville, and starts with a charter membership of twenty-four, though a roll of fifty is expected within a very short time. The officers chosen were: President, C. L. Graves; first vice-president, C. O. Romig; second vice-president, A. R. Lanning; secretary-treasurer, Alexander Robinson.

Mrs. Teape and Daughter and Their Waltham Buckboard.

FROM PORTLAND, ME., TO PORTLAND, ORE.

PORTLAND, Me., May 16.—On Tuesday, May 12, at noon, there saw started from Portland, the first trans-continental trip ever begun from the Forest City. The trip as planned will cover a distance of four thousand miles, and will take the whole Summer if necessary. Those who started on the long jaunt were Mrs. E. E. Teape and her daughter, Mrs. Vera McKelvie, of Sands Point, Idaho. The route of the autoists will end at Portland, Oregon, and will pass through the following cities: Boston, Springfield, Albany, Syracuse, Buffalo, Cleveland, Chicago, Des Moines, Cheyenne, Salt Lake City, Ogden, Boise and Baker City to Portland, the destination.

This trip was not the first the two have made, for last year they made a trip from Chicago to Denver. They are thoroughly acquainted with the West, and realize the difficulties which they will encounter. The journey is not in any sense a speed contest nor an endurance one. Mrs. Teape has driven a Waltham buckboard for several years, and in this make of car will make her trans-continental trip.

NEW YORK TRADE'S CARNIVAL BANQUET.

Harmony, cooperation, and organization, as valuable factors of success in the retail automobile business, were appropriately dwelt upon by most of the speakers at the banquet given to newspaper men by the subscribers to the fund of the carnival promoted by the New York Automobile Trade Association. The function took place at the Brevoort Hotel last Saturday night. The social and fun-making feature of the affair was much more conspicuous than is usual at trade dinners. There were singing and jollity galore, and, altogether, the affair had the merry swing of a fraternity function. All this intimate commingling of the good fellows of New York's "automobile row" had its foundation in thus getting together for the promotion of the recent carnival.

A business meeting was made a part of the prandial gathering. Most important action was taken in the passage of resolutions declaring for another carnival next year, placing it under the management of the former committee of hustlers and again choosing for chairman Gen. John T. Cutting, whose offspring the spring opening celebration really was.

The report of the carnival committee showed that \$8,655 had been subscribed by 87 concerns, made up of 24 subscriptions of \$200 each, 21 of \$100, 18 of \$50, 23 of \$25, and 1 of \$10. To this was added \$870, received from entry fees to the hill-climb. The balance, \$347.45, was generously spent on the dinner.

Among the speakers were Gen. John T. Cutting, H. M. Duncan, O. J. Bechtel, J. C. Wetmore, L. H. Perlman, Harry Caldwell, Alfred Reeves, E. S. Partridge, Orrell A. Parker, Lawrence Hardy, A. G. Batchelder, Robert Lee Morrell, Alexander Howell, W. J. Morgan, Alex. Schwalbach, Peter Fogarty, Al. Camacho, and Senator Thomas H. Dunn, of Monroe County, N. J.

Where Guest of Honor Houpt and Friends Sat at Table.

A BON VOYAGE BANQUET TO HARRY HOUP.

By way of bidding Harry S. Houpt bon voyage, and also wishing Louis Strang and John B. Marquise good luck in their quest for Grand Prix honors with the Thomas car, the selling staff of the Harry S. Houpt Company tendered the "easy boss" a banquet at the Hotel Marseilles, New York City, last Thursday evening. Mr. Houpt sailed on the *Lucania* yesterday, and on the same day the car and its full crew took passage by the *Adriatic*. All are to meet at the training quarters Mr. Houpt will engage on the Dicppe course.

Fred J. Titus, who acted as toastmaster, let no man escape. Every one had to get up and speak his little piece of tribute to the guest of honor, and good wishes for the success of the car and its crew. The pluck of E. R. Thomas in tackling the foreigners with a stock car, rather than to make good his entry was complimented, and the "live wire" part of Harry Houpt played in securing Strang for a driver, and his enthusiasm in agreeing to go over himself to manage the outfit, were justly and right royally extolled. The guest of honor responded with a modest expression of hope that the Thomas pilgrimage would not be in vain, coupled with confidence that the car ranked among the best of the American stock product.

"Le Gavroche Americain," as the French have already dubbed Strang, a title whose application will be understood by readers of Victor Hugo, in his speech, said he was sure he had a good car, and promised to do his best to land it near the front.

John E. Bowles and Henry G. Vogel, of the Harry S. Houpt Company, were made joint guests of honor, and made to respond to toasts. Mr. Bowles wanted everybody to forget that a Thomas car was going over, and bear in mind only that it was rather a case of an American car striving to uphold the honor of the United States against the foreigners. Edgar M. Houpt, who is ill, was given a cheer over the telephone. At one point the room was darkened, and "Bon Voyage, H. S.," blazed forth in electric letters.

Theodore Sheldon was the most active spirit in the arrangement of details of the successful banquet. His fellow hosts were Fred J. Titus, A. D. Frost, R. D. Willard, F. G. Youngs, F. K. Bowen, A. S. Robinson, F. D. Garringer, H. M. Pyke, and Montague Roberts.

M'CORMICK'S OLDS WAS NOT THE CAR.

BALTIMORE, May 18.—In the report of the Maryland Sealed Bonnet contest, which appeared in THE AUTOMOBILE recently, it was stated that the Oldsmobile driven by A. L. McCormick stopped in the mountains and began to slide down a bad hill backwards, narrowly avoiding a collision with a Thomas car following. Investigation by the officials in charge of the event proved this to have been erroneous, a mistake having been made in the number of the car to which this happened.

FRANKLIN SCORES IN DELAWARE ROADABILITY.

WILMINGTON, DEL., May 16.—Frank L. Connable, who is connected with the DuPont Powder Company, and an enthusiastic autoist, enjoys the distinction of having won the first roadability run of the Delaware Automobile Association, which took place to-day over a 45-mile course, with the court-house as the starting and finishing point. The course led through Kennett Square and West Chester, Pa., partly over mud roads, for it had rained the day before, and partly over pike roads.

The committee having the arrangements in charge had fixed 3 hours 29 minutes as the time in which the run could be made; this liberal allowance being for the benefit of the low-powered cars, the run being open to all. Mr. Connable, who drove a Franklin touring car, made the exact time, and was awarded the handsome loving cup offered by the club as a prize. The next nearest was H. S. Lane, of Philadelphia, in a Thomas runabout, 3 hrs. 28 min.; and third was Robert S. Glover, of Wilmington, in a Maxwell touring car, 3 hrs. 34 min.

The fastest time was made by J. R. Richardson's Mitchell touring car, operated by Elmer Fisher, which covered the distance in 2 hrs. 27 min. Thirty-four were entered, and thirty-two started, all finishing except two, which met with mishaps.

TEN PERFECT SCORES IN JERSEY RUN.

PATERSON, N. J., May 18.—Of the even dozen cars that started in the 100-mile, non-stop, sealed-bonnet contest, held under the auspices of the North Jersey Automobile Club here last Friday, no less than ten of the contestants went round the full length of the course in the specified time of 5 hours 15 minutes.

The successful cars to finish were: G. A. Post's Winton, J. Hengeveld's Stevens-Duryea, J. Schofield's Corbin, G. DeWitt Brown's Maxwell, J. Vanderlock's Ford, H. B. Haines' Knox, the two Overlands driven by J. Garlick and Walter Hudson, and R. Beattie's Buick.

The start was made at 10 A. M., with three minutes' headway between the cars, and there was a large gathering to see the contestants off. The route led through Haledon, Pompton, Mountain View, Singac, and Little Falls, and included quite a few stiff hills. The two cars that fell by the wayside were S. Meredith's Corbin and R. W. Bates' Conover, but as the latter's delays were due to punctures, which cost him one hour and twenty minutes, he was not disqualified, time consumed in tire repairs being allowed, as is now the general custom in contests where endurance is the chief factor.

NO DECISION IN SELDEN ROYALTY TANGLE.

TRENTON, N. J., May 18.—Postponed from May 4 to to-day, the hearing of argument pro and con on the petition of the receivers of the defunct Electric Vehicle Company, of Hartford, Conn., for a modified form of contract between the latter concern and the Selden patent licenses, same before the United States Circuit Court here this morning. The court made it plain that consent would not be given to the adoption of the new contract unless at least three-fourths of the members of the Licensed Association would agree to it. Ex-Governor Griggs, who represented the interests of the latter, moved that a referee be appointed, ex-Chancellor McGill being mentioned in this connection, but the motion was denied, the court finally agreeing to take the matter under advisement.

AERONAUT LAMBERT MAY REPLACE LAHM.

PARIS, May 15.—A. B. Lambert, secretary of the Aero Club of St. Louis, has now made eleven balloon ascents from Paris, the last three having been alone, and has qualified for the pilot's license of the French club. It is very probable that Mr. Lambert will act as one of the American pilots in the Gordon-Bennett balloon race, taking the place of Lieutenant Lahm, whose position in the army makes his participation doubtful.

RHODE ISLAND PASSES HORSEPOWER TAX BILL.

PROVIDENCE, R. I., May 18.—After a two-hour discussion, in which a great number of amendments were proposed, and some of them adopted, the House of Representatives ended its second day of talking automobile legislation by passing the amended Senate measure. The act, as it came back from the judiciary committee of the House, contained many suggested amendments. Chief among those that were given serious consideration were the ones fixing the registration fee at 50 cents per horsepower per annum, and that raising the speed limit to 15 miles in closely built-up places, and to 25 miles in the country. These were passed. An attempt was made to make the latter limit 30 miles, but was defeated, as were also several other proposed amendments of doubtful importance. In spite of the fact that considerable competent testimony had been adduced at the hearing to show that a plain tire was apt to do more damage by skidding than one with a chain on it, an amendment was passed prohibiting the use of chains on gravel, macadam or other made roads, not including dirt roads or city pavements, except when there was at least one inch of ice or snow on the ground.

STATUS OF THE LAMP DESIGN LITIGATION.

It has been stated that in the various actions of the Rushmore Dynamo Works, Plainfield, N. J., against various makers and dealers who are alleged to have made and sold lamps in colorable imitation of the Rushmore designs, a preliminary injunction had already been granted. This was true in the case of the Manhattan Storage Company, which was recently convicted of violating the court order and was fined \$100. In the case of the complainant against the Badger Brass Manufacturing Company, of New York, which is the most important action in the litigation, the injunction order restraining the defendants has not been actually signed as yet, and will not be until the appeal of the Manhattan Screw and Stamping Works, from a similar restraining order granted against them, has been decided by the Circuit Court of Appeals.

The order of the United States Circuit Court for the Southern District of New York, signed by Judge Lacombe, is as follows:

The defendant having this day presented its petition for appeal to the United States Circuit Court, praying that an appeal might be allowed from the decree or order of preliminary injunction granted by said United States Circuit Court to the Circuit Court of Appeals for the Second Circuit and praying that said appeal might be made a supersedeas, and the Court having duly considered the matter, it is hereby ordered

First—That the appeal be allowed.

Second—That the exhibits be sent to the Circuit Court of Appeals as prayed for in the petition for appeal.

Third—That the order for preliminary injunction aforesaid shall not become effective immediately, but shall be suspended until two days after announcement of decision of Court of Appeals in Rushmore vs. Manhattan Screw and Stamping Works.

Three Tons of Indians on the Packard Truck.

During the stay of the Wild West Show in New York City the noble red men were given a ride on Riverside Drive. The photograph was taken in front of Grant's tomb.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

American sizes in Pirelli tires and tubes, with the regulation type American tire valves, may now be had of the various supply houses handling this Italian tire, or of the American branch office of Pirelli & Company, at 296 Broadway, New York.

Town cars of all sizes and types are rapidly being equipped with the Truffault-Hartford shock absorbers to prevent those uncomfortable jounces that result from the city's uneven pavements. Among the cars thus equipped during the past week were John D. Rockefeller's White steamer and Mrs. W. K. Vanderbilt, Jr.'s, Thomas town car.

The Warner Instrument Company, Beloit, Wis., makers of the Warner Auto-Meter, have just brought out an automatic tire-filling air-valve that is claimed to represent a revolutionary development in this field. It is opened by being brought into contact with the tire valve itself and is guaranteed to be positively self-closing. It is of extremely simple and durable construction and is claimed to be capable of filling a four-inch tire in 15 seconds, with 100 pounds pressure on the tank.

The annual meeting of the stockholders of the Monarch Motor Car Company, of Chicago Heights, Ill., was held at the Chicago Automobile Club, May 12. The old directorate, consisting of P. M. Hanney, Evan A. Evans, M. H. Kilgallen and T. A. Quinlan, Jr., was reelected, and R. J. Gunning, F. A. Moody and Rush C. Butler added to the board as new directors. T. A. Quinlan, Jr., was also reelected president and general manager of the company, and J. A. Ward, secretary and treasurer.

"Ready-Flated," the term first used in connection with the Continental tires on removable rims which were used in the recent Briarcliff race, is a registered trademark, and the Continental Caoutchouc Company is issuing a warning to the effect that the use of the name in connection with anything except the Continental product that it was coined to designate will be prosecuted. "Ready-Flated," says J. M. Gilbert, manager of the Continental company, "designates a Continental tire already inflated for use on a Continental rim. This is the type of tire replacement used on nearly half of the cars in the Briarcliff."

H. B. Wild, who has been making ascensions at the White City, Chicago, and other cities, has made arrangements with the Prest-O-Lite Company, Indianapolis, for a complete lighting and signaling outfit. The Prest-O-Lite storage tank to be supplied the aeronaut is made of aluminum, specially treated to give it high tensile strength, and has sufficient capacity to keep the searchlight burning for 20 hours. The lamp is also of aluminum and in addition to its use as a searchlight is fitted for "wig-wag" signaling, by means of shutters, and with red and green shutters for emergency signals. The total weight of the tank and searchlight is only 34 pounds.

It is not often that the vice-president of a republic cannot buy the car of his choice, yet this has been the case with Señor Ramon Corxal, vice-president of Mexico, who ordered a 1908 Packard and was unable to secure one, in spite of the fact that the Packard company is turning out 300 more cars this year than last, all reports of financial depression and other alleged preventatives to the contrary notwithstanding. Señor Corxal placed his or-

der with the Compañía Pan Americana de Vehiculos, Mexico City, but their wire arrived too late, every dealer having disposed of his allotment for 1908. It is an incident that forms striking evidence of the success the company has achieved in devoting itself to a single type of car. The entire Packard plant is now busy completing the output so that all the 1908 Packard 30's may be delivered on time.

A new method of construction designed to overcome a most frequent cause of trouble in pneumatic tires has been introduced by the Pennsylvania Rubber Company, Jeannette, Pa. This is the tendency of the tread to blister and separate from the carcass as the result of hard driving, and to overcome this fault mechanical power has been substituted for the usual method of hand wrapping, as it was found that the latter did not produce a uniform tension all round, and that there were apt to be numerous points where the union was imperfect. Another construction improvement is the use of fabric strips of sufficient length to go completely round the tire in place of the usual piecing together made necessary by the ordinary fabric. The new material is being woven especially for the manufacture of Pennsylvania tires, and the showing of the latter in the Briarcliff is said to be largely due to these improvements.

NEW AGENCIES ESTABLISHED.

The Overland is a newcomer to Cleveland, O., where it will be handled by George Baumetz. Later on Mr. Baumetz will add the American and Marion cars to his agency line.

The Maxwell-Briscoe Motor Company has established an agency at Redlands, Cal., with S. F. Boynton & Sons. Rialto and San Bernardino are to be included in the territory covered by the new agency.

The Metropolitan Motor Car Company has just been appointed the Cleveland agent for the Knox Automobile Company, Springfield, Mass., and will handle the Knox line in that city and adjacent territory.

The Lowe-Crawford Company has just been organized in Boston by George H. Lowe and R. S. Crawford, to handle the Crawford car in that territory. Salesrooms have been opened at 173 Huntington avenue.

Way, Mitchell & Company is the title of a new firm organized to represent the Republic tire in Cleveland, O., and the agency establishment is soon to be opened on Euclid avenue opposite the Union Club. L. C. Pellott will act as manager.

Frank Coleman has been appointed agent for the Akron Pneumatic Tire Company, of Akron, O., at Cleveland, O., and will open headquarters at 1922 Euclid avenue. His territory includes the entire State of Ohio, with the exception of the cities of Akron and Cincinnati.

Hopewell Brothers, Cambridge, Mass., manufacturers of automobile fabric supplies and accessories, have withdrawn their agency from the Allen Auto Specialty Company, and have opened a New York branch house of their own. Quarters have been secured at 1900 Broadway, and C. A. Russell, formerly representing the firm in the New England territory, has been placed in charge.

The Regal Motor Car Company, of New York, has just been incorporated with \$50,000 paid up capital, to handle the product of the Regal Motor Car Company, of Detroit. A 25-horsepower, four-cylinder, sliding-gear car is being offered at \$1,250 in touring car and runabout types, and at \$1,800 in town car and taxicab styles. Walter C. Martin, for the past five years metropolitan agent for the Cadillac, will be manager of the new company. Headquarters have been selected in the new Rhinelander building at Sixty-eighth street and Broadway, and the salesrooms are attractively fitted up.

RECENT TRADE REMOVALS.

S. E. Wherritt, sales manager of the Pierce Engine Company, Racine, Wis., who has his headquarters in Chicago, has removed from 1481 to 1507 Michigan avenue.

The Weldon & Bauer Company, successors to the F. E. Boland Company, Newark, N. J., representing the National line in that city, has removed to the new building at 200-202 Halsey street.

The Livingston & Ramsdell Company, agents for the Palmer & Singer cars in Newark, N. J., gave a housewarming on last Wednesday night to celebrate the opening of their new garage at 286 Halsey street.

It looks as if Halsey street would soon develop into the automobile "row" of Newark, N. J. The latest succession is the Linkroom Automobile Company, local agents for the Lozier cars, who have taken up new quarters at No. 239 recently.

PERSONAL TRADE MENTION.

E. B. Gallaher, American manager of the Maja Company, Ltd., who has been abroad in the interests of the Maja car in this country, has sailed from the other side and is expected in New York next week.

T. W. Meachem, president of the New Process Raw Hide Company, Syracuse, N. Y., manufacturers of raw hide and metal pinions and gears, has just been elected president of the Chamber of Commerce of Syracuse.

Harry Fosdick, the genial junior member of the Hol-Tan Company, has seized upon the opportunity presented by a few days' let up in the business of getting Shawmut cars on from the factory at Stoneham, Mass., to take a three-day fishing trip to Lake Winnepesaukee.

Walter S. Austin, of the Austin Automobile Company, Grand Rapids, Mich., has been in the East recently looking round the agency situation and has returned to his home town, much pleased with the contracts he took back with him. It was not exactly an agency contract, but something in the matrimonial line, as he was married to Miss Elsie N. Chesebrough at Newton, Mass., May 12.

Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, left early in the week, on his regular tour of inspection of the factories of members of the association, and incidentally to make some preliminary arrangements for the Chicago show, which will be managed by the makers themselves this year, the same plan being carried out in the case of the Grand Central Palace show in New York.

INFORMATION FOR AUTO USERS

Radio Batteries.—This is a new accumulator, specially designed for automobile ignition service, which represents the result of more than ten years' experience in the manufacture of storage batteries. It is made by the Radio Battery Company, whose factory and repair shop are located at 433 West Forty-second street, New York City. The makers state that they have found the chief source of trouble in storage bat-

THREE-CELL SET, RADIO BATTERY.

teries to be the manner of constructing the plates and the lack of proper provision for retaining the electrolyte in the jars. To overcome these faults the containing jar of the Radio battery is of the flanged compartment type and is made from a new insulating compound that is acid proof. The cover is of the same material, made in one piece with the terminal bases and vent tubes, and is provided with a special ribbed edge. Pure para rubber washers hermetically seal the cells, while the gas ventilating caps screw into the vent tubes with a soft rubber washer. They are of the ball valve type. Cover clamps of enameled and noncorrosive steel are used and the handles are of the same material.

Burrowes Emergency Wheel.—E. T. Burrowes & Company, Portland, Me., have recently placed on the market an improved type of spare wheel which presents several new features. It is made to take the different sizes of tires in use

CONSTRUCTION OF BURROWES SPARE WHEEL.

and will be supplied for either clincher or quick detachable types. Where the front and rear are different sizes, special spare wheels to fit either will be furnished. To attach the new Burrowes spare wheel it is only necessary to hook one of the rigid clamps, or anchor posts, over the rim of the car wheel where it

rests on the ground, and then roll the car on the clamp. Next the other rigid clamp is hooked over the rim and the two screw clamps are tightened until the wheel is held firmly in place. As a precaution against creeping, straps are passed round two of the clamps and the adjacent spokes. These straps may be attached to either the anchor posts or the adjustable screw clamps in such a way that they cannot fall off, even when loose. The valve stem is protected by the anchor post on the rim. The Burrowes spare wheel is very rigid and does not affect the running or steering of the car. The rims are inspected and approved by the Association of Automobile Tirc Manufacturers.

BURROWES WHEEL ON CAR.

Winship Auto Trunks.—The name of Winship has been associated with high-grade trunks and other travelers' requisites for more than half a century past, W. Winship, 71 Summer street, Boston, Mass., having made an enviable reputation for quality in this line. In catering to the wants of the autoist he has brought out a very extensive range of trunks to fit all kinds of cars and on all

TYPES OF WINSHIP AUTO TRUNKS.

kinds of places on the car, in addition to an assortment of touring equipment of other kinds, such as special pockets of genuine or imitation leather to fasten on the back of the forward seats, imported lunch baskets in great variety, lunch trunks, emergency kits, ice trunks and ice baskets, buffet trunks and the like.

"Buckeye" Cleanser.—"No one who has ever used Buckeye Cleanser has ever accused it of being like the ordinary kind," say the makers, the J. P. Davies Company, Dayton, O., manufacturers of laundry and textile soaps and successors to the Buckeye Soap Company. It is a soap made entirely of pure vegetable oils and is prepared especially for cleansing highly polished and painted surfaces. Being perfectly free from alkali or gritty substances, it does not scratch or leave the cleaned surfaces with a smoky appearance, but produces a bright shine on a polished surface like

a new coat of varnish. It is put up in five and ten-pound cans, twenty-five-pound pails and barrels or half barrels. Samples will be forwarded on request.

Patterson Wireless Battery Holder.—A new and decidedly radical improvement in the manner of connecting up dry cells is embodied in an invention which is just being placed on the market by Stanley & Patterson, 23 Murray-27 Warrcn streets, New York. In fact, it is such a simple, logical and sensible way of connecting up a battery of dry cells that the wonder is no one thought of it before, for binding posts and connecting wires have certainly furnished their quota of ignition troubles to the autoist. The new device consists of a base holding several sockets into which the several cells comprising the battery are intended to be screwed home until they make contact with the "automatic bridge"—a patented form of connection which closes the circuit between the two adjoining cells automatically the moment a cell is removed from one of the receptacles. Thus a dead cell may be re-

PATTERSON WIRELESS BATTERY HOLDER IN CASE.

moved at any time without interrupting the ignition current, and if a new cell be not available at the moment no change in the connections is necessary. When the new cell is procured it is simply screwed into place. This permits of taking out any cell that happens to be exhausted, without disturbing the rest and with a minimum of trouble.

The Patterson "Wireless" battery holders are made to accommodate 6, 8, 10, 12 and 16 cells of battery, but any

WIRELESS CELL SOCKETS.

combination of cells is made possible by means of the "automatic bridge." The Patterson type dry cells intended to be used with these holders do not differ from the standard dry cells, except that at the top the zinc containing case has a deep thread rolled into it, while the carbon has a flat butt terminal. The complete holder is enclosed in a waterproof cabinet and the latter is provided with a false bottom, so that in case the Patterson cells are not procurable on a long tour this can be lifted out and the usual type employed. The company will forward its Bulletin "C," describing the different models, on request.

THE AUTOMOBILE

One Man's Family Tour from Coast to Coast

JACOB M. MURDOCK, of Johnstown, Pa., ended at New York at 2:07 o'clock on Tuesday afternoon a Pacific-to-Atlantic run of 3,674 miles, having covered in a Packard car the distance in 25 1-2 days of actual running, or, to be exact, in 32 days 5 hours 25 minutes gross between the times of start and finish. Mr. Murdock thereby set up new Pacific-to-Atlantic figures for a car operated by a single crew, though not, of course, equalling the record of 15 days 2 hours 10 minutes accomplished by the Franklin six-cylinder with shifts of drivers.

These figures, however, convey most inadequately the value of the present performance, which can truly be said, all circumstances and conditions considered, to have been the most remarkable and convincing demonstration of the touring practicability of the automobile that has yet been given.

The Owner Drove Entire Distance.

Mr. Murdock, an out-and-out amateur owner, drove the entire distance himself. He carried in his car a full complement of seven passengers, comprising his wife, three children, a guest and a mechanic. He drove solely by day and rested on the five Sundays of the journey and lay over two days besides, one on account of rain and the other for recreation at his own residential town. In a word, Mr. Murdock's was an out-and-out touring run and in no sense a race for record.

His average mileage per running day was 146.36 miles. His longest day's run was 244 miles, between Pittsburg and Philadelphia, and his best Western mileage 241 miles, between Cheyenne and North Platte, which was followed by a 235-mile run the following day to Columbus, Nev. The total weight of the Packard, including equipment, fuel and passengers, carried as far as Ogden, was 500 pounds, barring a 150-pound lessening of weight through Nevada.

The performance of the car itself was, of course, equally as noteworthy as was the driving of its pilot. A broken ball bearing in the front wheel caused three hours' delay and a burnt connecting rod bearing through the oil running low cost five hours. That was all the mechanical stoppages. The Continental tires performed as well as did the engine. On reaching New York the car was running on its second set, and but two punctures had been sustained during the entire journey.

Mr. Murdock proved a transcontinental automobile tour to

be pleurably possible and took a journey across the continent out of the category of abnormal stunts. He demonstrated that no path on this continent presents difficulties not surmountable by the pluck and patience of a tourist.

Mr. Murdock's passenger list was made up of Mrs. Murdock, their daughters Lillian and Alice, age sixteen and fourteen respectively, and their son, Jacob, Jr., a youngster of but eight years, and his mechanic, Philip de May. L. L. Whitman was a guest as far as Ogden, and P. W. Spaulding, a lawyer of Evanston, Wyo., from that point to the end of the journey.

Mr. Murdock himself, a man in the "forties," though looking to be far down in the "thirties," is a lumber merchant of the firm of J. M. Murdock & Bros., Johnstown, Pa. He spends his winters at Pasadena, Cal. He told his story most modestly at the Bellevue-Stratford on Monday night to a contingent of newspaper men M. J. Budlong, president of the Packard Motor Car Company of New York, had taken over to Philadelphia that afternoon in three cars to hear it. This trio of cars escorted Mr. Murdock to New York the following day.

How He Got Transcontinental Idea.

"I had occasion to make several trips between Johnstown and Pasadena this winter," said Mr. Murdock, by way of starting his story. "I spent many hours looking out of the car windows and dreaming dreams of making the journey home some day in my automobile. You see, I had been reading in the trade papers with great interest the tale of the Pekin-to-Paris run and the stories of the present New York-to-Paris race. When I reached Pasadena in February I had no idea of attempting the journey, and had even gone so far as to buy my railroad tickets home. I would keep asking myself: 'Is there a road across the United States?' My answer would always be 'yes.' Then I got to talking with L. L. Whitman, who lives in Pasadena, of how I could find it and of the possibilities of making the journey with my family. Finally I determined to make the attempt; at least, I resolved to go to that point when the discomforts should exceed the pleasures, and then to stop. That point, you see, was never reached.

"I made, two weeks before I started, a trip of 150 miles into the Mojave desert, the place I most, and almost only, feared. Then I came back and persuaded Mr. Whitman to accompany

me as far as Ogden. I did not wish to lose my family in the desert. I knew I would feel safe in staying by them if he were along to go for help if needed.

"We started from Los Angeles at 8 o'clock in the morning on April 24. I had waited to join in the welcome to Admiral Evans' fleet. We carried five days' provisions for emergency in crossing the Nevada desert, and water, too. There are water stations every fifty miles. Some in the center is not fit to drink. The natives will tell you which are good and which bad. I met at their hands, by the way, the kindest treatment throughout my journey. There are practically no maps of the desert. The latest United States survey maps show a blank space in the Death Valley district. Many of the places marked were practically no settlements at all, or the mere tumbledown shacks of deserted mining camps.

Good Roads to Goldfield and Tonopah.

"We headed for Daggett, and then northeast, crossing Death Valley, and came to Beatty. Between this place and both Goldfield and Tonopah, there are two roads, one for automobiles and the other for wagons. Cars built for Eastern use are at a great disadvantage in this district. They have too low clearance for the rocks and deep ruts, nor are they wide enough to fit the ruts. These rocks and ruts gave us great trouble. They would catch the flywheel and we were in constant fear of ripping it off. I had to stop at least ten times a day to pry the pan away from the flywheel. This question of clearance was, in fact, the most difficult of our problems in this region.

"The country abounded in dry lakes, some five to seven miles across, with a spongy surface that took a bit of nerve to tackle.

Then there was a driftsand that filled the tracks like quicksilver. At times we would have to wrap the wheels with heavy rope and replace it every half hour. Though we carried 150 feet, it was exhausted at Goldfield.

"Leaving Tonopah, we set out northeast for Ely, a journey of 240 miles, these points being railroad connections, so we were reasonably near enough to a railroad for safety. The road was remarkably good, there being lots of long stretches admitting of 25 to 30 miles an hour going. Our only guides were rough pencil drawings and the United States maps. We steered by compass a lot. In fact, we reached Ogden, having strayed no further than five miles from the true course.

Road Was a Nightmare.

"The road from Ely to Cobre, Nev., has not a grade or a hill and few 'washes.' For 140 miles it is good for 75 miles an hour. We had planned to make the run from Cobre to Ogden, 150 miles, in one day. It took us two days of the hardest work: From

Cobre to Kelton it is a nightmare. You have to straddle ruts a man could almost stand in. It is 80 miles to Kelton and 70 miles to Ogden, the latter a veritable swamp with mud two feet and water four feet deep in places. We took to the railroad track and bumped the ties for five miles. Further along we encountered twenty-five to thirty hills that would stop the wheels and stall the motor. We would have to throw on power and then block the wheels behind and repeat the operation. On one occasion we were from 2 to 6 o'clock in thus climbing a 300-foot stretch.

Advices Traveling Eastward.

"If you contemplate a transcontinental trip, by all means go West and come East, for the prevailing winds are from West to East, and they can keep or retard one a lot.

"I carried a speedometer, a glass front and a cape top. I only had to replace two springs. I did not reinforce anything before I started and did not even have the engine gone over. In addition to 22 gallons in the tank, I carried 5, 10 and 15-gallon cans of gasoline on the running board. My touring equipment embraced 250 feet of rope of assorted sizes, two shovels, pick, axe, sledge hammer and wrench. We used our cooking outfit quite often, as we slept not a little in unfinished shacks.

"We struck snow in Wyoming, being caught in quite a blizzard

Mr. Bennett, the Packard's Pittsburgh representative, left the Hotel Bellevue-Stratford Tuesday at 8:45 A.M., and started for New York from the Camden side at 9 o'clock. An easy run with stops at Trenton, New Brunswick and Newark brought the outfit to Weehawken ferry and landed it at the Packard Motor Car Company's garage, at Broadway and Sixty-first street, at 2:07 P.M. Mr. Murdock's odometer showed 3,693.3 miles at the finish. The excess over the aggregate of the daily runs taken from his notebook and herewith printed probably represents use of the car at his home at Johnstown and other places, as the route was not always strictly adhered to.

in the Laramie plain. We had little rain, most of it being ahead of us and leaving us its mud. We did not have to make a change in the carbureter for any elevation from sea level to 9,000 feet. The engine did not miss except during the snowstorm on the Laramie plain. The mud of Iowa was unspeakable, and, in fact, was the only serious obstacle east of Cheyenne.

"Before I had started, I had calculated on an average of 100 miles a day. Before I finished I found that steady going would give a much bigger mileage than this."

Mr. Murdock and his escorting caravan, which embraced another Packard, driven by his brother, W. F. Murdock, carrying

STEARNS FREE-FOR-ALL WINNER IN CINCINNATI HILL CLIMB

CINCINNATI, May 25.—The flight of John J. Ryan's Stearns up the half-mile hill on Stanley avenue in :31 4-5, in the free-for-all, brought to a close what would have been the best day's sport ever seen in this part of the country, had it not been unfortunately marred by an accident to Walter White.

Mr. White, whose driving feats have given him international fame, is now confined in a local hospital with a compound fracture of the right leg and sundry bruises.

The accident occurred in the free-for-all, and the crowd on the course is blamed for it. The White steamer was going nearly 60 miles an hour, and at this high rate of speed it was no easy task to swing out, but White did, and missed the people crowding the course, but he could not avoid a skid which caused the car to turn turtle, pinning him beneath it.

Before he could be picked up, John J. Ryan, in the Stearns, was given the word, and he came up the hill at railroad speed.

He saw the crowd in time, though, and managed to swing by without damage. Following this, though, the chief of police declared he would not be responsible for the safety of the crowd, whereupon the club officials decided to call off the climb. The honors in this interrupted free-for-all went to Ryan, whose Stearns beat the White by 4-5 second. In fact, Ryan really was the star of the climb, and had it not been for a mishap in Class D he would have taken three firsts. In that event he discovered, when half way up the hill, that someone had turned off his gasoline, and he had to be content with third. The officials granted him permission to make a time trial, which he did in :36 3-5.

An added event was a class for electrics, and two Babcocks put up a most creditable exhibition, making the hill a full minute faster than the next best performer, doing much to remove the belief that Cincinnati is not for electrics. Summaries follow:

FREE-FOR-ALL—Open to All Classes.

OFFICIAL REPORT OF HARTFORD CLUB'S RELIABILITY RUN

HARTFORD, CONN., May 23.—The official report of H. P. Maxim, referee of the recent reliability and fuel contest of the Automobile Club of Hartford, has been sent to the secretary of the technical board of the American Automobile Association, in which the results of the protests filed are announced. Two protests were received by Referee Maxim.

One was from the Capitol City Auto and Hack Company, entrant of the Mitchell, which objected to the manner in which the gasoline tank of the Mitchell was filled. Referee Maxim explains this by stating that when the tank was filled at the noon control the driver of the Mitchell stated it would take five gallons, so a can of that capacity was used. The tank would not hold the full amount and some of the fuel overflowed, whereupon Henry Southcr, who was officiating, estimated the waste at 1 pint, making due allowance on the ticket. This second filling made the Mitchell's total 9 gallons 3 quarts, whereas the

Ford, which was given the decision in this class, used 9 gallons 2 quarts 1 pint. Referee Maxim states that "the decision was based on Mr. Souther's record and judgment, backed up by the judgment as to the amount spilled by a member of the committee present experienced in such matters.

The Mitchell people also protested the Ford because the entry fee was not paid until after one lap of the contest had been completed, whereas the rules called for the fee accompanying the entry. This was dismissed by the referee when it was learned that the Ford entry had been accepted on the promise of the entrant to forward the fee within a few days, his credit being considered good by the committee. The fact that the Ford was allowed to start is blamed upon the committee rather than the entrant. The referee quotes a precedent for making this ruling.

Referee Maxim's report on the condition of the cars and the reasons for the penalization was as follows:

- No. 1 Franklin—Changing tire at Hartford control.
- No. 2 Corbin—Carbureter and engine trouble.
- No. 3 Corbin—No penalty; perfect score.
- No. 4 Ford—Stalled motor.
- No. 5 Stevens-Duryea—No penalty; perfect score.
- No. 6 Reo—Babbit burned out; broken connecting rod.
- No. 7 Stoddard-Dayton—Stalled engine; commutator trouble; tire trouble.
- No. 8 Rambler—No penalty; perfect score.
- No. 9 Ford—Did not start.
- No. 10 Rambler—Car backed down hill changing gears.
- No. 11 Rambler—No penalty; perfect score.
- No. 12 Knox—Stalled motor; tire troubles.
- No. 13 Buick—Engine trouble; faulty spark plug.
- No. 14 Compound—Gearshaft bent.
- No. 15 Stoddard-Dayton—No penalty; perfect score.
- No. 16 Thomas Flyer—Motor stalled.
- No. 17 Overland—Engine, radiator and tire troubles.
- No. 18 Thomas Flyer—Stalled engine; carbureter trouble.
- No. 19 Stevens-Duryea—No penalty; perfect score.
- No. 20 White—Disqualified; ahead of schedule time.
- No. 21 Ford—No penalty; perfect score.
- No. 22 Mitchell—No penalty; perfect score.
- No. 23 Rambler—Tire trouble.
- No. 24 White—Stopped to take on water.
- No. 25 Pope-Hartford—Engine and tire troubles.

- No. 26 Cadillac—Engine and tire troubles.
 - No. 27 Peerless—Engine and tire troubles.
 - No. 28 Oldsmobile—Tire trouble.
 - No. 29 Pope-Hartford—Stalled motor.
 - No. 30 Ford—Did not start.
 - No. 31 Corbin—Withdrawn.
 - No. 32 Knox—Motor stalled; adjusted spark plug.
 - No. 33 Corbin—No penalty; perfect score.
 - No. 34 Columbia—Ignition trouble.
 - No. 35 Thomas-Detroit—No penalty; perfect score.
 - No. 36 Packard—No penalty; perfect score.
 - No. 37 Cadillac—Ignition trouble.
 - No. 38 Pierce-Arrow—No penalty; perfect score.
 - No. 39 Maxwell—No penalty; perfect score.
 - No. 40 Thomas Flyer—No penalty; perfect score.
 - No. 41 Atlas—Tire trouble.
 - No. 42 Knox—No penalty; perfect score.
 - No. 43 Columbia—Leaking radiator connection.
 - No. 44 Mitchell—Carbureter trouble.
 - No. 45 Stoddard-Dayton—Did not start.
 - No. 46 Maxwell—No penalty; perfect score.
 - No. 47 Maxwell—No penalty; perfect score.
 - No. 48 Locomobile—Tire trouble.
 - No. 49 Buick—No penalty; perfect score.
 - No. 50 Oldsmobile—Tire trouble.
- Total. Perfect Scores, 18.

Along the Exhilarating Seacoast of Massachusetts—Near Revere Beach, Not Many Miles from Boston.

MORE beautiful, more epchanting, more exhilarating; beautiful because of its unsurpassed scenery, enchanting because of its mountains, rivers and plains, and exhilarating on account of its perfect clear air and hemlock and pine essence—this, in brief, is what will make the 1908 A. A. A. tour more popular than its predecessors. Scenic, as all Glidden tours of the past may have been, they will fade into oblivion when compared with the approaching reliability contest for the Glidden and Hower trophies, as laid out by the Premier pathfinder, in charge of Secretary Dai H. Lewis of the A. A. A. touring board.

Tourists could not ask for a better route. Even the chronic faultfinder can find little, if anything, to grumble about with this year's excellent route. The entrants will find mile after mile of beautiful macadam roads, naturally intercepted at intervals with some bad spots, but, taken all in all, the route is over some of the very best roads in the country.

Among the mountain ranges to be traversed are the Alleghanies, the Catskills, the Berkshires, the White mountains of New Hampshire, and the picturesque Green mountains of Vermont. Such rivers as the Susquehanna, Delaware, Androscoggin, Kennebec, White river, and numerous smaller streams will

be often crossed and followed during the tour. The route is:

First day—Buffalo to Cambridge Springs.....	117.4 miles
Second day—Cambridge Springs to Pittsburg.....	110.2 miles
Third day—Pittsburg to Bedford Springs.....	106.4 miles
Fourth day—Bedford Springs to Harrisburg.....	107.3 miles
Fifth day—Harrisburg to Philadelphia.....	133.5 miles
Sixth day—Philadelphia to Milford.....	132 miles
Seventh day—Milford to Albany.....	158.5 miles
Eighth day—Albany to Boston.....	194.2 miles
Ninth day—Boston to Poland Springs.....	154 miles
Tenth day—Poland Springs to Rangeley.....	141.7 miles
Eleventh day—Rangeley to Bethlehem.....	130 miles
Twelfth day—Bethlehem to Saratoga.....	184.5 miles

The total mileage for the tour is 1,669.7 miles. The odometer on the Premier pathfinder registered exactly 1,992 miles.

Previous stories have told of the tour starting from Buffalo, July 9, and taking in the oil, coal, coke, and steel regions of Pennsylvania; the run through the Delaware Water Gap; from Albany to Boston through the Berkshires and over the excellent State highways of Massachusetts to Boston.

While the run through the Delaware Water Gap and over the Alleghanies is through decidedly picturesque country, there

View from Poland Springs, Me., Where the Tourists Most Comfortably Will Spend One of Their Sundays.

Typical of the Road to Rangeley Lakes.

is no question but that the route from Boston to Saratoga, via New Hampshire, Maine and Vermont, will eclipse that of any other section of the tour.

From Boston to Poland Springs it will be by way of Cambridge, past Harvard University, through Somerville to the Middlesex Fells parkway, to the Revere Beach parkway and a two-mile ride along the beach and past the amusement places. This day's run brings the tourists for the first time to the shores of the Atlantic.

From Revere Beach the route leads to Lynn, to the Swampscott boulevard along Swampscott beach to Salem, known as the "Witch City." From here the tourists will pass through Newburyport, Portsmouth, N. H., where a turn seaward is again made to Rye Beach and past Boar's Head. The view of the ocean from this point is excellent.

Maine is entered at Kittery, and at York the Portland post road is traversed, and from there the route is then through a few small lumber camps, while the roadway is strewn with the famous pines, hemlocks, and fir trees of Maine. In the vicinity of Kennebunk there are several stretches of sandy roads. The roads from Boston to Portland are excellent for touring, and no hill was encountered which is larger than a knoll. From Portland the route leads finally to the Summit House, Poland Springs, where Sunday of July 19 will be spent.

From here the Presidential range of the White Mountains can be seen, ninety miles away. Mt. Washington, the highest peak east of the Mississippi, can plainly be seen towering nearly 6,000 feet heavenward. The scenery is magnificent, and in all directions towering mountains are to be observed for miles. It is an ideal spot for a stopover.

The day's run from Poland to Rangeley will be not only beautiful, but one of the hardest during the entire route. The

Logging Settlements Abound In Maine.

route leads through Auburn across the Androscoggin river into Lewiston. To the left of the tourists while crossing the bridge into Lewiston, are the fascinating falls of this river. The run through Augusta, Waterville, and up to Farmington is without particular interest, except for the Kennebec river, which is followed from Augusta to Waterville, and the unusually fine country roads.

Up to Farmington there are very few hills. The route chosen this year from Waterville to Rangeley is not through Skowhegan and the Dead River district, as was the case two years ago. After leaving Farmington, the roads are in excellent condition, with many level stretches up to Strong, twenty miles from Rangeley. From Strong to Rangeley very narrow and rocky roads predominate. The route lies along Sandy Creek. There are many water-breakers, and the Premier pathfinder struck many soft places with practically no bottom. A mile and a half from Rangeley the Premier struck one of these soft spots and sank to the radiator. On one side both hubs and the running board were completely buried in the mud.

Just a Touch of the Maine Atmosphere.

For three hours the car was in this quagmire, which was one of the worst of the entire pathfinding trip. It was slow shoveling, as the soft clay flowed back as fast as it was thrown out. After four hours of digging, filling in with rocks, laying planks and making detours into the field, the Premier reached the hotel with hardly a spoke in sight, so completely were the wheels choked with mud. But it was with some satisfaction that we learned the car was the first to Rangeley this Spring. It will be mid-Summer when the tourists will cover this stretch, and the roads will be seasoned.

A few miles north of Farmington one begins to get right next to nature. The narrow roadway leads into the dense main forest, where Nature is found in all her solitude. It is certainly the forest primeval, and the murmuring pines and hemlocks seemed to wave a welcome to the pathfinders. Great fallen "monarchs of the forest" were stretched on all sides, in many cases forming natural bridges across the streams. Several recently deserted logging camps are near the roadway. None but those who have visited the Rangeley Lakes and who have been through the dense Maine forests can appreciate that glori-

Rangeley Lakes, a Most Beautiful and Picturesque Mecca for Sportsmen and Vacation Seekers.

ous country and the "happy hunting ground" of all sportsmen. The air is permeated with the essence of fir, balsam, and hemlock. One can imagine how the Indian savage in the days of yore tramped through these forests hunting deer and bison, and skimmed over the forty miles of lakes in his birch bark canoe. For rest of body and contentment of mind, there is no more ideal spot.

While laying over a day at Rangeley waiting for the roads to dry, the pathfinders, armed with fishing tackle, made an attack upon the lake. Ray McNamara, the driver of the Premier, had not been there an hour before he pulled out a four-pound salmon. Secretary Lewis caught a trout about four inches long, and of course threw it back.

From Rangeley to Bethlehem, the following is the route: Madrid, Weld, Dicksville, Rumford Falls, Shelbourne, Gorham, circle Cherry Mountain, and Carroll. The beauty of the White

mountains, especially the Presidential range, is well known to Gliddenites. Among the many wonderlands of this vast continent none possess the variety of attractions of the White mountains. The Alps themselves afford no greater marvels of natural phenomena in the way of scenery, climate, and exhilarating environment than does this famous region.

The last day of the tour, a distance of 184.5 miles, between Bethlehem and Saratoga Springs, will not only be one of the hardest but the most beautiful. The route is through the magnificent Green mountains of Vermont, and includes Littleton, Lisbon, Newbury, Bradford, Hanover, past Dartmouth College, White River Junction, Woodstock, Bridgewater, Rutland, Castleton, Fair Haven, Whitehall, Glens Falls, to Saratoga.

The roads are in excellent shape until reaching the Green Mountain Notch where a climb of three and one-half miles will be made, reaching an altitude of 4,600 feet. This is a very

Vermont Offers Much in the Way of Green Clad Hills and the Captivating Connecticut Valley.

mountainous, narrow, and rocky road. During the day's run the Connecticut river was crossed at Wells river, Vermont, and the contestants will pass through the Connecticut valley and the White river valley. White river is followed and crossed many times from White River Junction.

To attempt faithfully to portray the beauties of Vermont scenery by means of printer's ink is no easy task. It is by far the most glorious country through which the contestants will pass. It is territory through which the Glidden tour has never been run. Even the camera's vision, while it may reproduce in piecemeal suggestions of sublime symmetry and enchanting vistas, cannot reveal the wider scope and prospect of unfolding beauties that greet the admiring eye on every side. The scenery of Vermont is not of magnificent, awe-inspiring grandeur, such as is characteristic of regions in this country where the Titanic upheavals of ages gone have reared colossal snow-crowned domes and gigantic gorges. Nature was in her gentler mood when she fashioned her handiwork in the Green mountains. The scenery is of the restful, pastoral kind, an undulating country of wonderfully verdant fields and hillsides, dimpled with tiny ponds and lakes and babbling brooks.

While the Premier pathfinder was greeted with enthusiasm during the entire trip, the welcome which it received through

At Hanover, N. H., Dartmouth College Is Located.

DEMONSTRATIONS AT A. A. A. CONVENTION.

BUFFALO, May 25.—Work is rapidly being pushed for the completion of the preparations to receive the visiting delegates to the Good Roads and Legislative convention of the American Automobile Association, to be held here July 7 and 8. The Committee on Practical Demonstrations, of which George C. Diehl, county engineer of Erie County, is chairman, has invited manufacturers of road machinery and makers of preparations for dust laying and road binding, to be represented at the Buffalo convention. About four miles of improved road will be set aside for the use of manufacturers of dust preventives, each being given a short strip, properly placarded, and the different applications will be subjected to heavy wear, the results being publicly announced later. Lateral roads in the same neighborhood will be turned over to the makers of road building machinery in order that they may demonstrate their apparatus thereon.

From the number of inquiries that are being received daily at the office of the Touring Board of the three A's in this city, it is evident that Buffalo will prove a Mecca for a very large number of runs and tours which are now being planned to bring their participants here in time to take part in the convention. These inquiries ask for routes, garage and hotel accommodations and similar information and come from various parts of the country within a radius of several hundred miles. President Strong, of the Rochester Automobile Association, has informed President Hower of the Automobile Club of Buffalo, that the Rochester club has organized a run to the convention in which about 200 will participate, quarters having been engaged at the Lafayette.

On the nomination of President Hower, President Hotchkiss of the A. A. A. has appointed a number of committees to assist the national officers in receiving and entertaining the delegates and visiting autoists. These committees and their chairmen are: Finance, H. A. Meldrum; reception, A. H. Knoll; entertainment, John L. Clawson; practical demonstrations, George C. Diehl. The committees in each case are composed of a large number of prominent autoists of this city, most of whom are members of the Automobile Club of Buffalo.

Mount Washington Looms Up Through the Clouds.

the White mountains district clearly showed that the farmers of New Hampshire welcomed the coming of the Glidden tourists. In this section people rushed to the front of their stores and houses, the men sending up a cheer and the women and girls waved their handkerchiefs. Many times the question was hurled after the pathfinders: "Is the Glidden tour coming this way?" Team drivers graciously turned to the side of the road and gave the car plenty of room, while in some other sections of the trip we found many "road hogs."

It would be doing an injustice to the Premier pathfinder, if at this time a tribute was not paid to the magnificent work which the car did on the trip. None but the pathfinders can appreciate what a terrible twenty-four day siege of spring mud-plugging and mountain-climbing this car went through. No car in America was ever given a harder test and when the route was completed at Saratoga, the powerful six-cylinder machine was running as smoothly as when it left Buffalo. We were particularly fortunate in having no punctures or blowouts during the entire trip—the tires used were Goodrich. No replacement was made on the Premier pathfinder, so that the run was as peaceful and uneventful from the mechanical point of view, as it was enchanting from the scenic.

And, Finally, the Pathfinder Reaches Saratoga.

AUTOMOBILE CLUTCHES AND THEIR DESIGN*

By HENRY SOUTHER, MEMBER A. S. M. E. AND S. A. E.

THE single disc clutch is widely used, here and abroad. It is so characteristic of a French make as to travel under the name of the firm—the De Dion. It is now used in this country by one firm for horsepowers ranging from 70 to 20, for pleasure and for commercial service. The clutch has a disc *A*, Fig. 35, on the driven member, *B*, which is clamped between two discs, *C*, on the driving member or flywheel. In Fig. 35 this arrangement is clearly shown. There are the necessary accompaniments of separating springs, so as to make disengagement perfect, also either single or multiple springs to cause the proper engagement.

Fig. 35—A single disc type.

Fig. 36 shows the same kind of a clutch in a slightly different form. The springs in this case are on the front side of the flywheel rather than on the rear, as in Fig. 35. Cork inserts are being used in this clutch to considerable advantage. Another form is the now popular multi-disc clutch; that is, the elaboration of the Weston clutch, to which I have already referred. This clutch is indicated clearly by Fig. 37, the alternate plates of bronze and steel attached to driving and driven parts being pressed together by a powerful spring, 5. The question of lubrication here is the all-controlling one, and, in fact, it would seem that the principal problem in connection with the multi-disc clutch as a type is the proper lubrication of it.

I have ridden in cars equipped with such clutches that were extremely savage in taking hold. I have ridden in others of the same make that were extremely slow to take hold. In a way, this may be a good thing. For example, a person going into a hill-climbing contest or race and wishing to pick up quickly would be perfectly willing to put up with a harsh clutch and lubricate accordingly. On the other hand, a car running about a level city, encountering few bad hills, would be able to lubri-

Fig. 36—Modified disc design.

Fig. 37—Form of multiple disc.

cate excessively and still have a satisfactorily driven automobile. A clutch so lubricated would be extremely soft, and yet pick the car up fast enough for ordinary purposes on level roads.

Cold and heat affect the operation of this clutch, the lubricant

in summer being thicker than can be permitted in winter. As it runs in oil it takes a certain length of time for the oil to squeeze out when engaged and for the metal to come in contact with metal and really begin to drive the car. It will be seen from this that the viscosity of the lubricant is of prime importance. One form of multiple disc clutch in use in a very high grade car consists of steel discs rubbing against a special bronze rolled into sheets. The steel discs are provided with several small tongues on the outer periphery, bent one side sufficiently to come in contact with the next steel disc, for the purpose of separating the discs and overcoming the drag when the clutch is disengaged. A small clutch brake is also provided to overcome clutch inertia or drag inherent in the clutch and due to viscosity of lubricant. The steel discs are put into the clutch as received from the rolling mill, with the hard black finish characteristic of carefully finished crucible steel.

Fig. 38—Assembly of discs.

This clutch is connected with the crankcase so that oil feeds into it from the crankcase through a hole drilled in the center of the crankshaft. Entire reliance, however, is not placed on this supply, a little extra oil being supplied every two or three days through holes provided for that purpose. Fig. 38 shows a nest of discs such as used in a well-known multi-disc clutch. The U-shaped separating springs are plainly visible. These force like discs apart when the spring pressure is released, overcoming the natural tendency of the oil to cause them to adhere. Some disc clutches are forced apart in a similar manner by little spring shaped strips struck up from the discs themselves. Another form of this same type of clutch is shown in Fig. 39. Comparatively few discs are used as will be noted. On the other hand, it is apparent that the spring pressure is very heavy. This is a successful and well behaving clutch used on a popular car at the present time. It drags but little when the gears are changed and is satisfactory in that respect.

A type of disc clutch consisting of all steel discs with alternate ones faced with leather was operated without any oil whatsoever, the leather being softened and made more or less pliable like the leather on the simple cone clutch. These clutches gave some trouble by burning up, the slip required to start smoothly being also sufficient to create enough heat to destroy the leather. This clutch was, however, extremely efficient in the transmission of power. For example, the one shown in Fig. 41, the discs of which are about 7 inches in diameter, was powerful enough to drive an automobile of 50 horsepower.

It must be remembered that the automobile engine runs at high speed, say, 1,000 to 1,200 r.p.m. when developing anywhere near its normal rating. Some motors, in fact, running up as high as 1,500 to 1,800 r.p.m. (standard rating is at 1,000 feet per minute piston speed). It is a fact that in service cars with disc clutches of this character vary more or less in the way their clutches behave. Clutches receive very much less attention than they ought, like everything else on the automobile. I think it will be admitted, even by the adherents of this form of clutch, that it ought to receive more attention than the leather-faced

*Paper read before the American Society of Mechanical Engineers at New York, May 12. Discussion to be continued at Detroit, June 25-28, in conjunction with the Society of Automobile Engineers. Continued from page 707, "The Automobile," May 21.

Fig. 39. Modifications of Multiple Disc Types.

coue. Nevertheless, this is now a very successful type of clutch, largely used in many high-grade cars.

In the matter of the number of plates in the disc clutch there is no agreement between designers. Some use a very large number of thin plates, as many as 50 or 60, and others use a very small number, as few as six or eight; in fact, it may be said that the single disc clutch, which has only two frictional surfaces, is the lower limit. One very ingenious application of the multiple-disc clutch has been made by a manufacturing concern in the East (Sturtevant Mill Company, Boston) in the fact that the pressure on the discs is brought about by centrifugal force acting on weights so arranged as to press the tighter with increased velocity. This is shown by Fig. 40. One of the weights is at *W*. It will be noticed that this weight operates against a spring, *A*, which prevents it flying out and gripping at too low an engine speed. Once, however, this spring pressure is overcome, the discs indicated by the alternately light and dark spaces are pressed together. It would seem that this principle has one serious defect in the fact that at low engine speeds the gripping tendency would be small. It would, therefore, not be possible to develop high torque at low speeds, which is sometimes quite desirable. It is a fact, however, that it is almost impossible to stall an engine by applying this clutch too quickly, as it does its own releasing so promptly and automatically. It is almost human in this respect.

This principle has been elaborated in connection with an automatic change of gears: gear No. 1 being picked up at a given rate of revolutions by its set of disc clutches; gear No. 2 by an increased number of revolutions by a separate set of discs, and so on. In driving a car so equipped the changes take place without being perceptible except with the closest observation. This system is open to the objection, however, of not being able

to spin the engine up very rapidly and connect with the low gear, in order to jump the car out of a hole or some unusual situation. I understand this has been overcome by supplying an independently operated lever for the foot to be used in emergencies only.

Fig. 41—Showing small dimensions of the average multi-disc type of clutch.

With the automatic Sturtevant multi-disc clutch it has been found experimentally that, for the maximum slip speed usual in automobiles, 15 to 20 pounds per square inch pressure is safe, and the lubricated cast iron discs scarcely wear out the tool marks after many thousands of miles use. They further state that experience has shown them that safe slip is merely a matter of good lubrication and low pressures. They have experimented with small cast iron discs, running dry and with constant slip at two pounds per square inch pressure, and even at that they wore many weeks transmitting a heavy load.

A modification of the multi-disc clutch in which the cone and the disc are combined is attracting much attention. This clutch (Hele-Shaw) is fully described by its inventor in the Transactions of the Institute of Mechanical Engineers (Great Britain), July, 1903. Fig. 38 shows a set, or "pack," of discs from such a clutch. Careful scrutiny reveals a V-shaped circular impression struck up in the end disc. Fig. 42 also shows the V shape of the discs very well indeed; in fact, the whole clutch is well shown here in section. I call attention to the female cone, *D*, bearing on the male cone, *f*, when the clutch is thrown out, thereby checking the spinning tendency of this clutch, or, if the viscosity of the oil is heavy, holding it quiet during the changing of gears.

In place of the entire surface of the discs bearing, only the V portions engage. This clutch is copiously lubricated, and the V, or engaging portions of the discs, are perforated with holes

Fig. 42—Combined cone and multiple disc idea in Hele-Shaw clutch.

so that the oil may circulate quickly in and out of the V grooves as they are engaged and disengaged. Outside the V portions of these plates or discs there is a comparatively large space between them, permitting the free circulation of oil and consequent rapid carrying away of heat if the clutch slips much.

In connection with the article referred to in the Transactions of the Institute of Mechanical Engineers there are some very good data on power transmitted by various spring pressures, given in Fig. 43. Fig. 44 shows the character of the curve depending upon horsepower and pressure of springs.

One thousand horsepower is being transmitted by one of these clutches running at 700 or 800 r.p.m. and measuring 18 inches in diameter between the Vs in the discs. The following table gives the dimensions and number of plates used for different horsepowers:

	Bronze	Steel
25 h.p., 27 plates of 6 1-2 in.....	14 outer	13 inner
40 h.p., 25 plates of 8 1-2 in.....	13 outer	12 inner
60 h.p., 21 plates of 11 in.....	11 outer	10 inner

The space in length required inside of the clutch casing for 25 plates is 5 in., this including the space for the disengaging movement and the spring pressure plate.

The number of plates in this clutch is made to vary with the power transmitted, the diameters remaining the same within certain limits. The principle involved is that the thickness of the pack of plates shall not exceed the diameter of the plate. When

Fig. 43—Power chart for the Hele-Shaw multiple disc clutch. Figures at the right = horsepower; those underneath, pressure.

this becomes necessary in order to transmit a load, the plates are increased in diameter, fewer of them being used. The clutch is necessarily heavy, but this is partially offset by the relatively small diameter. It has, consequently, little spinning tendency. The materials for disc clutches in general have been various; namely, steel on steel, steel on leather-faced discs, steel on bronze and steel discs with cork inserts. I have recently been informed of a disc clutch with cork inserts of natural cork that wore out in about 1,000 miles twice in succession. This same clutch was equipped with compressed cork inserts previously described, which have driven the car some 5,000 or 6,000 miles without perceptible wear.

It is a fact that steel discs against steel have become badly heated and cut to such an extent as to make the clutches inoperative.

Steel against bronze, however, does not seem to cut in this manner and the wear after two years' steady use is only 0.002 inch or 0.003 inch at the outside edge of the discs. I have not heard of the original combination of Weston, that is wood against iron or steel, being used in connection with automobiles. The cone clutch stands alone in the great care necessary to so construct it as to permit it to seat itself absolutely concentrically. All the other types of clutches are for the most part free from this difficulty. But

Fig. 44—Chart of spring pressures. Figures at right = horsepower; those underneath = number of plates.

it will be seen from the foregoing that the simplicity of the cone offsets the extra care necessary in its installation.

It may seem from what I have said in regard to clutches in general that it is about the worst part of an automobile that can be mentioned, but I hasten to correct this impression if it exists. As a matter of fact, I find reference to the behavior of the clutches in the last Glidden tour, a tremendously severe test of some 1,500 miles. An observer states that the clutches came out of this test quite as well as many parts of the running gear. My own experience is that it is a mighty poor automobile clutch that cannot be neglected and cannot run without any attention whatsoever for 1,000 miles.

A pneumatic clutch has been developed which has not been widely used because of its cost. It is a plain leather-faced disc pressing a metal plate as indicated in Fig. 45. The clutch is located within the flywheel and the air is forced from the pump through a small air cushioning tank and from there it enters the clutch through the hollow crankshaft B and an air valve. The air deflects the leather diaphragm C, causing it to bear against the metal disc D, which can have a slight endwise motion, and forces it against the fiber disc E permanently riveted to the casing F, which latter is bolted to the flywheel.

Fig. 45—The Northern pneumatic clutch.

Fig. 46. Simple Form of Hydraulic Clutch.

Fig. 47.

Hydraulic clutches have been used but are not popular. Figs. 46 and 47 show one of the simpler forms that has appeared. The magnetic clutch is in use and is fairly successful. Such clutches are operated on the same principle as the so-called "pick up magnet" found in so many plants. One complication arises in the fact that one of the parts of the magnet has to rotate continuously, the gears being always in mesh; consequently the exciting current has to be carried to it by a brush. A considerable current is also necessary on the car for the operation of the clutch. As I have already stated, there is a great variation of detail in friction clutches. This paper cannot cover it all, but will, I trust, be of enough interest to lead to discussion, which will do more to fully develop the state of the art than has been possible in this summary which I have prepared.

TO CHECK VALVE-TIMING FOR MAXIMUM EFFICIENCY

AN apparatus known as the Larrad, has been produced with the object of regulating the timing of a motor in order to produce the maximum of power. It consists, writes Louis Lacoïn in *Omnia*, of a metallic plate *A* mounted on a shaft *E*, to which is attached the blade *D* and a spirit level *B*. The metallic plate is pierced with three series of holes, and in the base of the spirit level are three holes to correspond with each of the three series on the plate. Finally the milled nut *C* allows the holes in the two pieces to be brought into correspondence.

Fig. 1—Larrad apparatus for regulating the timing of motors. A, disc pierced with a series of holes; B, spirit level, in the base of which is a hole for each of the preceding series; C, pin to secure holes in different positions. Arrow indicates direction of rotation.

Its construction allows of a variety of methods of mounting; thus, it may be slightly bent and wedged in between the cone and the flywheel. The only essential conditions are that the shaft *E* should be parallel with the crankshaft, and that when the motor is turned over the apparatus should describe a cylinder and not a cone around the motor shaft. When the cone *A* is mounted on its shaft *E*, it should be possible to make a complete revolution of the crankshaft. This is a condition often difficult to obtain with the motor mounted on the chassis. It is possible to attach the apparatus to the cranking lever, though this is not to be recommended, and the better way would be to place the motor temporarily on Hoop's.

Supposing now that the blade *D* is fixed to the motor, that the shaft *E* is exactly parallel with the crankshaft, and that the whole apparatus has been attached to the shaft *E*. The first operation is to make the hole, *exhaust*, correspond with the hole, *zero*, which indicates the upper dead center. The motor is now revolved until the piston has reached the upper dead center, and the plate *A* is turned round until the spirit level attached to it indicates a perfectly horizontal position. At this point the thumb screw is tightened up, thus securely attaching the plate *A* to the shaft *E*, and the apparatus is ready for service. (See left hand drawing of Fig. 3.)

To regulate, for instance, the exhaust valves, the pin *C* is withdrawn and placed in the holes noted; this time the motor

is turned over until the horizontal has been obtained, this being the exact position at which the exhaust valve should commence to rise (center of Fig. 3). All other timing is done in the same way, without dismantling the apparatus from the motor. Thus, for the closing of the exhaust valve (right of Fig. 3), the pin is placed in the hole *exhaust* of the base of the spirit level and the hole *closing* of the plate, and the motor turned until the spirit level indicated that a horizontal position has been obtained again.

It is hardly necessary to point out here the methods of modifying the timing of a motor. The Larrad apparatus, also, only indicates the positions of the crankshaft corresponding to the different cycles of the motor, leaving it to the mechanic to lengthen or shorten the tappet rods or change the position of the cams on the shaft in order to obtain the opening of the valves or the production of the spark at the point indicated by the apparatus. It should not be overlooked in employing the instrument that the cycle of a motor occupies two revolutions, and that the Larrad apparatus does not indicate during which of these revolutions the timing takes place.

Fig. 3—Larrad apparatus mounted between the cone and flywheel. 1, Position of upper dead center; 2, position of opening of exhaust; 3, position of closing of exhaust. A, disc, pierced with holes; B, spirit level; F, closing of exhaust; H, dead center point; I, clutch cone; O, opening of exhaust; V, flywheel; Z, upper dead center point.

As will be readily perceived, the apparatus is easily employed and permits of minuteness in the regulation of a motor. By thus eliminating vague groping, it should become of considerable service to constructors if they would modify the disc and pierce it in a manner to correspond with their own engines. Unfortunately the inventor has only made one type of disc, his idea probably being that his type was the only perfect one.

MICHELIN TOURING GUIDE IN ENGLISH.

There is no necessity for eulogy in connection with the guide books published by the Michelin Tire Company of France, Italy, and America. The mere fact that the French guide has a certified circulation of 60,300 copies for 1908 and is in the hands of every autoist touring France is sufficient proof of its value. Though consisting of over 600 pages, it is produced of such dimensions and in such a compact manner as to be carried in the pockets of a car without any inconvenience and to be consulted with the greatest facility. In addition to information on practically every town in France and detail maps of the most important cities, there is a complete sectional map in colors of the whole of France and very detailed maps in two colors of the most important cities. Very complete touring information is supplied, and there is a quantity of interesting matter on tires well worth the consideration of all automobilists.

Owing to the large number of English-speaking people making use of the Michelin guides for touring in Europe, the company has decided to reproduce the complete volume this year in the English language. This edition, which will be as complete in every respect as the French volume, will make its appearance in a few weeks. The Michelin guides are distributed free to all autoists desiring a copy and can be obtained from either the Paris headquarters or the American factory at Milltown, N. J.

Fig. 2—Profile view of the Larrad. A, disc; B, spirit level; C, pin; D, blade for attaching; E, shaft to be fixed parallel with the crankshaft; H, winged nut fixing disc A to shaft E.

LETTERS INTERESTING AND INSTRUCTIVE

STARTLING SCHEMES OF AN OLD INVENTOR.

Editor THE AUTOMOBILE:

[1,377.]—You are a good judge of auto schemes. I have a scheme that I believe will take. It is this. With my boiler (a coal burner) I can evaporate far more water than any auto boiler made, as I can get three times the heating surface. I can make a one-seat auto that can make 100 miles in one hour on a racetrack, and with my steel tires with corks in it will not skid, and I can turn corners much faster than a rubber-tired car. My scheme is this: make such a car, then challenge any gasoline auto for a race on a track at Coney Island. Now, in your opinion, would there be a large crowd to see the race at 25 cents admittance, the race to be 100 miles? I am set back a couple of weeks with my auto on account of a flaw in one of the boiler heads. I had to send it back to New York to get a new head. I hope to call on you with the car by the middle of June.

I also have a scheme to keep the car from upsetting going round curves. I will place a pole 8 feet long on the left side of car, hinged so as it can be raised upright when on straight track and let down horizontally going round curves, and an athletic boy to slip out to the outer end of the pole, then slide back as the turn is made. This, with the corks in tires, will enable me to go fast turning corners without danger of upsetting. I will burn coal in this, my first auto. I can make steam much faster with coal over either gasoline or kerosene. I deliver the gases from outlet under the car floor, nothing being visible in the fire box.

Oneonta, N. Y.

W. W. HAZELTON.

With a good promoter back of it, such a scheme as you outline in the first part of your letter, should be a success, as the crowd that flocks to Coney Island on holidays and Sundays in summer is quite willing to pay to see anything novel in the way of a sensation—the more sensational it is, the better.

Regarding your proposed method of preventing a car from overturning in rounding a curve, we are not quite so optimistic. It would be out of the question to try it on tracks as constructed at present owing to the fence that surrounds the inner field. Why not substitute a sliding weight, that could be pulled out or in according to the requirements, for the "athletic boy"? Although there would be no great difficulty in getting someone foolhardy enough to take the risk. The weight would be a little more positive method. It would be out at the end of the pole when you wanted it and you would not be so apt to lose it by the way.

WHO CAN SHED ANY LIGHT ON THIS MYSTERY?

Editor THE AUTOMOBILE:

[1,378.]—Probably you would be kind enough to help me out on the question of circulation of water through a six-cylinder engine with a gear pump.

What is the cause of the water heating down through the pump after running the engine 5 or 10 minutes? I have had the pipes from the pump disconnected, also the one from the cylinder to the radiator, and attached the garden hose to the same, and forced a stream through cylinders. I also tried the radiator the same. I then filled the radiator, started the engine, and the pump pumped the radiator empty. I tightened the fan belt, so that is O.K., and adjusted the carbureter in every possible way. Have it at present very nearly closed, so that the mixture is as weak as is possible to make it run. Therefore, with no stoppage in the radiator, not any in the cylinders, or pump, I am at a loss to solve the mystery, and light on the matter would be much appreciated.

Portland, Pa.

M. B. HAUSER.

With the small quantity of water carried on the modern car, and the rapidity with which it is circulated, it is nothing out of the ordinary for it to become warm throughout the entire circulating system, after the motor has been running for ten minutes, so that if this is the only thing complained of, we do not see that there is any fault to be found. You do not say that the motor overheats badly, water boils away or anything of the kind. The only time the water should really be cold is when the motor has not been running for an hour or more; otherwise, it should be as hot as it can be maintained, short of boiling, and with the motor running steadily, there will not be a great deal of difference between the temperature in the jackets and at the pump.

WHICH IS THE EASIEST ON THE MOTOR?

Editor THE AUTOMOBILE:

[1,379.]—We have ordered a seven-passenger, six-cylinder touring car of 54-horsepower, A. L. A. M. rating, and 36-inch wheels. The maker wishes to have a ratio of 2.5 to 1, and claims that it reduces the wear on the engine. It seems to me that a ratio of 3.5 to 1 would be better for such a hilly district as Pittsburg. If the engine is running faster, it is not straining as much, so I think the wear would be nearly the same in each case. A car geared 3.5 to 1 would be easier to run through the city, and better for touring in this locality, as it could accelerate more rapidly between the water-breaks which are so abundant near here.

Please explain fully the pros and cons of this matter, as it has been the source of many arguments.

Allegheny, Pa.

MURRAY FAHNESTOCK.

The reason for providing a car with a certain gear ratio, is to enable its motor to run at its normal speed, or at as near that rate as possible, while the car is travelling under different conditions. Thus gearing a car very low, would make it necessary to overspeed the motor in order to obtain a fair speed on the level, though such a car would be in its element on the hills and should climb anything "on the high." Gearing it up, on the other hand, would make it very fast on the level without the necessity of speeding the motor above normal, but it would make a poor car for hill-climbing or city use. Most designers have attempted to strike a happy medium by adopting something that will not go to either extreme, and thus be found suitable for the use of the greatest number without alteration. But such an expedient naturally does not fit a car for particular uses, such as that you wish to put your new machine to.

With regard to the argument put forth by the maker, a certain gear can hardly be said to reduce the wear on the engine, unless the car with that particular gear is used more or less constantly in a locality adapted to it. A very high-g geared car will have to strain its motor constantly in a hilly district, at least where the nonsensical practise of trying to drive it over all kinds of hills on the high, is followed, as the motor will be called upon to deliver its maximum power at a speed considerably below its normal r.p.m. rate, and will have to labor to do so. But a car with a very low gear will be equally abused where driven constantly on level roads, owing to the necessity of racing the motor to obtain higher car speeds. We should advise the adoption of a 3 to 1 gear for the car you have in mind, and this with the logical and reasonable use of the shifting lever wherever required, will give a machine that will have more than enough speed on the level, coupled with the ability to climb anything in the way of a hill, with its full load up.

DIFFERENCE BETWEEN NAPHTHA AND GASOLINE.

Editor THE AUTOMOBILE:

[1,380.]—Will you kindly answer, through the columns of your paper, the following question given below?

What is the difference between naphtha at 74 degrees and gasoline at 68 degrees? Would naphtha testing 74 degrees be all right to use in an automobile, and would I realize any more power than using gasoline testing 64 to 68 degrees?

Millford, N. H.

SUBSCRIBER.

In this country, naphtha is merely a trade name as commonly used and where called for in the ordinary course of affairs, the substance supplied is naphtha, gasoline or benzine, as the tradesman happens to designate it. Originally, the term was employed to indicate one of the lighter distillates of petroleum, and is only distinguished by the difference in density or specific gravity. It is not a totally different substance, though there appears to be a popular misconception on this point. Crude oil is separated into its components by means of what is known as fractional distillation, the temperature being controlled during the process in order that the various substances may be evaporated consecutively in the order of their relative densities. Prof. C. E. Lucke classifies petroleum distillates as follows: Petroleum ether, 85

to 80 degrees Baumé; gasoline, 80-78 degrees; naphtha, three grades being enumerated, 78-60 degrees Baumé. Then comes kerosene, and next lubricating oils. The Baumé scale must not be confused with specific gravity, as is so commonly done, 80 degree gasoline having a specific gravity of .66. Garagemen and supply dealers commonly regard these terms as interchangeable, consequently what they offer as "72, or 74 gasoline" may, in reality, be something not far from kerosene, the specific gravity of which is .753, or higher, but the density of which ranges from 56 to 32 degrees Baumé.

It is a matter of common knowledge that the refiners no longer find it profitable to attempt to market the lighter distillates, owing to the very small quantity contained in crude oil. Hence, there is very little fuel to be had on the market at present, lighter than 64 to 68 degrees Baumé, or .70 to .72 specific gravity. This will answer your query regarding the difference between gasoline and naphtha. The difference in the fuel values of the different distillates ascends as they get heavier, kerosene being credited with a slightly greater number of heat units per pound than gasoline, but the heavy liquids are not as available, as they do not vaporize as readily. A slight adjustment of the carbureter may be necessary to take care of the difference in fuels, but this is not ordinarily the case except where maximum economy is aimed at, so that you will find practically no difference in the action of the motor on the fuels you mention.

WHAT IS THE CRITICAL SPEED OF THIS CAR?

Editor THE AUTOMOBILE:

[1.381.]—Please answer the following, under the head of "Letters Interesting and Instructive."

At what speed would a car of the following description consume the least fuel? Motor two-cycle, four-cylinder, 4 1-2-inch bore by 4-inch stroke, geared 3 to 1, with 34-inch wheels.

Would four-inch tires on this car, which weighs 2,500 pounds, be sufficiently large for occasionally carrying seven passengers? What are the gear ratios of the following cars on the high, low and intermediate speeds? Thomas, Stearns, Ford six-cylinder, White Steamer, and Reo.

New York City.

INQUISITIVE.

It would be impossible to state what the critical speed of a motor is without more data than you give in your letter, although as a matter of fact, it would not be easy to make calculations that would be much more than an approach to the speed at which the motor in question would run most economically. A cut-and-try method would be the only manner of ascertaining this definitely, and slight influences would be apt to influence this one way or other. Assuming your engine to develop about 30 to 35 horsepower, it would doubtless be found to run most economically at a speed ranging between 25 and 30 miles per hour. At speeds of from 10 to 20 miles an hour it would be comparatively wasteful of fuel, particularly at the lower range of its speeds, and this would again be found to be the case when it reached 40 miles an hour and over, though the increase in fuel consumption is not quite as sudden at speeds higher than the car's critical speed within a certain range, as it is below this point.

Four-inch tires should give very satisfactory service on a car of this weight, and no inconvenience should result from the occasional carrying of overloads, in case the tires are kept well inflated at all times. This is far more important than taking a little extra weight in the car.

After a long wait for the information, we have received the following regarding the Stearns, Ford and Thomas cars. We have received no reply to our inquiries concerning the gear ratios of the other cars mentioned in your letter. On the Stearns, assuming a motor speed of 1,000 r.p.m., the rear wheels make 89 r.p.m. on the low and reverse; 182 on the second speed; 265 on the third, and 360 on the fourth or direct drive, giving gear ratios of 11.35 to 1, 5.5 to 1, 3.7 to 1, and 2.7 to 1 respectively. These figures are not exact, not having been figured beyond one or two decimal places. The sprockets employed to give this result are 24-tooth front and 40-tooth rear. The gear ratio of the Ford six-cylinder car is 3 to 1 on the direct drive, and 7½ to 1 on the low, only two speeds being provided. With a 28-tooth

front sprocket and a 52-tooth rear sprocket the gear ratios of the Thomas Flyer are 12.025 to 1, on the reverse; 9.84 to 1, on the first speed; 5.99 to 1, on the second; 4.22 to 1, on the third, and 2.785 to 1, on the high.

GEAR RATIOS OF A THOMAS FLYER.

Editor THE AUTOMOBILE:

[1.382.]—Kindly tell us the gear ratio of a 1908 Thomas car where the bevel gear on main shaft has 30 teeth and bevel gear on countershaft has 44 teeth. The sprockets on countershaft have 32 teeth, and the sprockets on the rear wheels have 52 teeth. Kindly give us your method of figuring same. ADOLF A. GEISEL.

Springfield, Mass.

According to a blueprint furnished us by the makers of the Thomas cars, the only options given on the 1908 models of the Thomas Flyer, i.e. Models F and K, are 28, 30, 33 and 35-tooth driving sprockets, so that we presume you must have made an error in stating that the sprockets on the car in question have 32 teeth. With 33-tooth front sprockets and 52-teeth rear, the gear ratios are as follows: On the direct drive, 2.36 to 1; third speed, 3.58 to 1; second speed, 5.08 to 1; first speed, 8.35 to 1; reverse, 10.2 to 1. Dividing the number of teeth in the large gear of the drive, by that of the bevel pinion, will give the number of turns that the latter will have to make for one of the former, and the same operation in the case of the driving sprockets will give their ratio. For instance, it is evident that with a 50-tooth gear, driven by a 25-tooth bevel pinion, the latter must make two revolutions to one of the gear, and, assuming front and rear sprockets of the same number of teeth respectively, it is also apparent that their relative rates of speed will be the same as that of the bevel drive on the countershaft. Hence, when on the direct drive, or high gear, the crankshaft of the motor would be making two turns for every one of the countershaft, and the latter would be making two turns for every revolution of the rear wheels, and the gear ratio of the car would be 4 to 1.

POINTERS FOR A SECOND-HAND PURCHASER.

Editor THE AUTOMOBILE:

[1.383.]—I am contemplating the purchase of a Darracq (second-hand), on which the former owner made the wheelbase 14 inches longer than the manufacturer. He thought it would ride easier, thus the change. Which would be the better, to leave it as it is, or change it back to where it was when new? What would you do to try it to see if it is O.K.? I have seen it assembled and know that it is in first-class shape, and have seen it running in the stand. It has a new timer, transmission (sliding) and two tires. How long a road trial ought it to have to see if any of the bearings or engine heats up or works loose? DARRACQ.

Allegan, Mich.

Whether it is advisable to alter the lengthened wheelbase to what it was formerly or leave it as it is, would depend to a very large extent on how well the job was carried out. As you saw the car assembled, you should be in a position to judge of this. The longer wheelbase is an improvement on an old car, as it was one of the worst failings of designs current prior to 1904. It makes a great improvement in both the steering and the riding, and if the change was well done, it would certainly be a mistake to undo the job. From what little you say of it, the car would now seem to be in excellent shape. We should prefer a full day's run of 100 miles or more, as the short demonstrating ride usually given proves nothing except that a car will run without trouble for a short distance. It is valueless as a test of a car.

FAILURE TO RESPOND TO THE THROTTLE.

Editor THE AUTOMOBILE:

[1.384.]—I would like to have your opinion, through "Letters Interesting and Instructive," of the trouble with a Schebler carbureter from the following symptoms: The car will not speed up unless the spark is very high, and opening the throttle has no effect at all until it is very nearly wide open, when the car speeds up, but not as fast as it ought. Running slowly with the throttle closed and the spark very little advanced, opening the throttle has very little, if any, effect; but if the throttle is quickly thrown wide open and as quickly closed (without advancing the spark at

all), the car speeds up considerably. The car is also somewhat sluggish, and very slow to pick up. SUBSCRIBER.
New York.

Judging from the symptoms of the trouble that you give, the cause would appear to lie in a deranged auxiliary air-valve. This, particularly from the fact that the sudden opening of the throttle to its full width causes the motor to speed. See if the auxiliary air-valve has not become deranged in some manner so that it does not respond readily, as where this is the case, the mixture becomes overrich, owing to lack of the proper quantity of air, and the motor instead of gaining power and speed, acts very sluggishly. Take this auxiliary valve out and start the motor by closing the secondary air outlet with a piece of cardboard. Then work the throttle, giving more air proportionately to the opening of the latter by sliding the cardboard back from the aperture, and note the result. A little experimenting of this kind should reveal the cause. Clean and adjust the auxiliary valve, replace and regulate in the same manner until the motor runs satisfactorily.

CAN ANYONE IDENTIFY THIS MOTOR?

Editor THE AUTOMOBILE:

[1,385.]—I have an engine, the "paternity" of which I have been unable to trace, and wish to know if you can give me any information that will help me to locate the manufacturers. It has four cylinders, cast separately, valves offset on opposite sides of cylinders mechanically operated, spark plugs in center of cylinder heads, standard (1-2 inch) thread, camshaft, pump and timer gears all inclosed in front of crankcase, connecting rods look like brass. The only marks on it are parts that have a number followed by the letter B. H. A.

Brighton, Ill.

The features you mention are characteristic of several motors that we have in mind, barring the bronze connecting rod, that we are not certain of, this part of the motor seldom being exposed to view. But they are not sufficiently distinctive to narrow the choice down to one, so far as we are concerned, so we are referring the query to our readers, some of whom will doubtless have had experience with the same make of motor and can name it offhand. If some subscriber who is in a position to do so will supply the necessary information it will be published in these columns, or transmitted direct to the inquirer.

DOES POOR TIMING CAUSE THIS TROUBLE?

Editor THE AUTOMOBILE:

[1,386.]—Through "Letters Interesting and Instructive" please advise me in regard to this annoying trouble. Have a Maxwell runabout which pounds in one cylinder running light or under load, spark advanced or retarded, but ceases when run with this cylinder dead. Have lengthened the valve stem a very little and the pound ceases, but also with the result of loss of power. Under these conditions I find face of valve dirty, evidently caused by loss of explosion on account of valve not seating properly. Have then shortened valve stem, allowing it to seat properly, and valve is bright and there is the power, but also the pound. Is not the seat of this trouble in the timing; that is, the exhaust valve not opening soon enough? W. C. B.

Kalamazoo, Mich.

Failure of the exhaust valve to open soon enough would be responsible for a great deal of back pressure on the piston, and this would doubtless manifest itself by a pounding noise. The exhaust valve should begin to open before the piston reaches the lower end of its downward course on the power stroke, so that it will be fully open at or just before the dead center is passed. The amount of this so-called lead varies with different designers, but you can ascertain about how much it is on your motor by checking up the action of the valve on the other cylinder. Look at the cam of the valve in question and see whether it is worn, or has become displaced. Wear of either the cam or the valve tappet would naturally tend to make the time of opening the valve later and as soon as this became sufficient to cause it to remain down on its seat beyond the point at which the cylinder should exhaust, the energy stored in the flywheel has to force the piston back against the cylinder full of gas and this would account for the noise, or pound, that you mention.

ABOUT GRINDING CYLINDERS BY HAND.

Editor THE AUTOMOBILE:

[1,387.]—Inclosed you will find a letter from E. Sparenberg, of Peru, Ind., in answer to my query published in "The Automobile" of May 7. I think this letter is of great value to some of your readers, and I would be pleased if you would publish it in your next issue:

"Mr. V. R. Lane:

"I was much interested in your query in "The Automobile" concerning compression. As I have had considerable experience in motor and auto building, probably I could help you out a little in your trouble. As is well known, the very slightest leakage reduces the power greatly. That is why manufacturers of high grade motors spend so much time and money to finish the cylinders so elaborately. In a motor of my own design and build, I did just what you are considering doing; that is, grinding the cylinder with an abrasive while it is in motion. Fairly good results were obtained in that manner. I then tried another method, which was far more satisfactory, and which I would do if I had your motor. First I took the cylinders, pistons, and connecting rods off and ground the cylinder out by hand by working the piston back and forth, with rings off. I used emery dust, and while working the piston kept turning it around continually. In this manner the cylinders were ground out perfectly, great care being taken not to grind too much. I then had new pistons and rings turned, which, by the way, is not very expensive, and fitted them very carefully. The rings should be doweled, the pin, of course, coming at the joint. The new pistons should fit tightly, that is, so you can just work them by hand, and plenty of oil should be fed until they are worn a little. I am talking from experience, not from theory, and hope this information will be useful to you."

Peru, Ind.

E. SPARENBERG.

"Letters Interesting and Instructive" have been of great value to me and, I presume, to many of your other readers.

West Liberty, Ia.

V. R. LANE.

FOR AUTOISTS SEEKING PUNCTURE INSURANCE.

Editor THE AUTOMOBILE:

[1,388.]—In regard to note from E. Elseman, No. 1,352, in regard to internal tire protectors, better advise him to try the Dow inner tube. I have tried the External tire protectors and, while they do all they claim, they detract from speed and make a car "loggy." I have gone on the principle that no matter what the financial cost, anything which would do away with the fear of puncture without interfering with speed, resiliency and responsiveness of the car, was cheap. The metal inside tire protectors have been tried by many and discarded as unsatisfactory. I have just tried the Dow inner tube long enough to feel safe with them and, while the first cost is excessive, the knowledge that you can drive a nail through your tire and tube if you want to and have it seal itself perfectly without the loss of air, is worth to me all it cost.

The tube itself is a very heavy one; with the tread double; between the two layers of rubber is a plastic material incorporated with feathers, which does the trick. The first time I went out with one I picked up a piece of board containing a nail which pierced the tire and tube, and with any other tube would have resulted in deflation and later repair. I pulled it out and have paid no further attention to it, and the tire is still hard. It seems to me to be the best device yet, and I therefore pass it along.

Summit, N. J.

ELIOT GORTON, M.D.

AGREES WITH MR. KRARUP ON SPECIAL STEELS.

Editor THE AUTOMOBILE:

[1,389.]—I have read with a great deal of interest Marius C. Krarup's comments on "Special Steels." For the last eight years I have been connected indirectly with the manufacture and operation of motor vehicles, especially commercial vehicles, and must say that my observations and experience tend to confirm all of his statements from No. 1 to No. 5. For commercial vehicles, whether taxicabs or heavy trucks, where vibration and road shocks are excessive, I should much prefer to see a low point carbon alloy steel, never over 30 point, used, and that the cross-section of the various parts, especially axles, steering knuckles and connections, should be large.

The parts as ordinarily designed may be large enough to withstand all ordinary shocks and vibrations for several months, but the time is sure to come when some shock is met with, a little greater than before, when any one of these parts will fail. A slight increase in cross-section or size of the parts mentioned will not increase the weight or first cost of the vehicle appreciably, but will be the best insurance the purchaser can have. The commercial vehicle has only to break down once and be towed in and remain out of commission for a day or so to more than offset any first cost that the above may entail.

Boston, Mass.

ALEX. CHURCHWARD.

MASSACHUSETTS TO HAVE MILITARY-GUARDED ROAD RACE

LOWELL, Mass., May 25.—Since the announcement a fortnight ago that an automobile road race was to be held just outside this city on the Fourth of July, the "Merrimac Valley course," as the circuit has been christened, has been visited by

any trouble to a driver well acquainted with the course. From the double curve the smooth macadam roadway continues up the river bank with only one curve to the Tyngsboro bridge, where the upper turn is located.

Merrimac Valley Course, where the Steepest Climb Presents Itself.

large numbers of autoists, including some of the prominent racing men of the country. And all who have driven over the roads that are to be used have come away well pleased and have expressed the opinion that the Lowell race should be one of the speediest and most exciting ever held in America, not even excepting the great international contests that have taken place in the vicinity of New York. The circuit is only ten miles long, and is to be covered twenty-five times to make the 250 miles of the race. On almost any course so many circuits would be extremely trying on the drivers, but the Merrimac Valley course is peculiar in that it consists of practically two straightaways with none but easy curves and a turn at either end. Lowell Automobile Club has charge of the contest, and the officers and committees are hard at work preparing for the race. Besides the valuable Butler Ames trophy, three cash prizes have been offered of \$500, \$250, and \$125 for the drivers finishing first, second and third respectively.

It has been decided to start the race on the boulevard, where there is a straightaway of considerably more than a mile. This situation will make it possible for the spectators in the stand to see the racers at full tilt, and the stretch offers opportunity for speed not equaled even by the famous Jericho turnpike, the scene of the greatest bursts of speed in past Vanderbilt Cup races. Some distance from the start the boulevard swings to the right with an easy curve and then to the left around a bend in the river. Then comes the first difficult place, a double curve opposite the Vesper Country Club. This curve will not cause

Here the course swings to the right and the cars will make a semicircle into the back stretch. This turn is in good condition for speed, but for the race it will be banked.

Immediately after entering the backstretch of Willow Grove avenue there is a long fifteen per cent. grade that has to be surmounted, and then a sharp pitch into a hollow and another climb, the steepest in the course. The road is straight and has a good surface, so these hills will supply only the needed variety from the level boulevard. Entering Varnum avenue there is a fine smooth roadway all the way back to the city. In lower Varnum avenue there is a car track, but

there is plenty of room on the sides, and the street will be closed during the race. At the lower turn there are to be banked corners, a cross street being taken for the purpose. This will bring the races into the lower end of the boulevard and give them time to straighten out and attain highest speed before reaching the grand stand.

There is ample room along the boulevard for parking spaces and for throngs of spectators, and the Lowell Club is planning

Two-mile Straightaway 50-foot Road Near Start.

to take care of a great crowd. The course will be patrolled by militiamen, and arrangements are being made to secure fifteen companies for the purpose, so that there will be ample protection for every foot of the course. This will be very necessary on the straightaway stretches near the start and finish, as the ground there is very flat and ample precautions will have to be taken to guard against the crowd spreading out over the road at these points. As a matter of fact, a very large part of the course is favorable to the crowding of spectators, and that this is realized is evident from the thoroughly businesslike precautions that the promoters of the race are taking to guard against interference from this source. The manner in which these measures are being carried out might well be patterned after elsewhere, as it is the intention of the promoters of the race to leave nothing undone that will tend to insure a clear course for the contestants and the absolute safety of the spectators.

Where the Long Grade Begins Just After Making the Upper Turn.

HOW THE A. A. A. TOURING BOARD DOES ITS WORK

By T. J. SULLIVAN.

BUFFALO, May 25.—From the date of the quarterly meeting of the directors of the American Automobile Association, to be held here June 2, to arrange for the National Good Roads and Legislative Convention, to the departure of the caravan of cars on the reliability contest for the Glidden and Hower trophies, July 9, Buffalo expects to emphasize her present claim to the title of the "Capital of American Motordom." Thus far her claims to the distinction rest upon the circumstances that this is the abiding place of President William H. Hotchkiss, of Chairman Frank B. Hower of the Touring Board, and of Dai H. Lewis, secretary of the latter-named body and pathfinder of the reliability route, and that here is the headquarters of the Touring Board.

Not unknown to fame is the chairman. Many who took part in the Cleveland-Chicago-New York tour of last July recall with various feelings the shock they received when they attempted to handle the chairman of the Touring Board and bend him to their own ends. He looked quiet and pliable, but they found him a live wire. The thirty-five newspaper representatives, partially accustomed to having officials come to them on the jump when they crooked their finger, hardly knew what to do when Chairman Hower jumped on them. Finally a few of them decided that they would roast him. And they did. There were few who arrived in New York without a liberal brown from the sun and dust of the tour, but the chairman must have felt cooked through.

The offended scribes roasted him the first day from Cleveland to Toledo because the pace was too slow; the next day they roasted him because the pace from Toledo to South Bend was too fast. Because some contestants took muddy turns too fast with resultant disaster, the chairman had to stand the blame. Newspapers throughout the country were shrieking with the "suicide race" as a grateful relief from the former absorbing topic of "race suicide." When the chairman took the matter in hand and went ahead as pacemaker, the hypercritical correspondents hounded him for that. The pacemaker started a half-hour ahead each day, the contestants starting each a minute later thereafter, then tore madly over the landscape until they bumped the rear axles of the chairman's car and of one another, riding in a cloud by day and a pillar by night, and accumulating strata of dust on their features until they looked like an excursion of grain scoopers. And Chairman Hower was cursed for the dust, too.

"Why doesn't he go faster or get out of the way," raved the Hotspurs of the pens that two days before were filling columns with lurid descriptions of "The Race of Death."

But the "Napoleon" went on his uncompromising way. Other members of the touring committee insisted on having their way, and in every case where he yielded a mistake was rung up. Finally, he paid no attention to protest or "holler," but took absolute charge of the tour. And between their clamorings, the newspaper men noticed that Chairman Hower was making good. The tour, they admitted, was conducted without suspicion of graft, and every entrant received a square deal. And as the profession is basically fair and only occasionally hysterical,

it befell that by the time the tourists arrived in New York they voted unanimously that "Napoleon" Hower was a good fellow and that the tour the most successful on record. The "All's Well that Ends Well" came when he was appointed as the "Committee of One" to conduct this year's tour, with nearly universal approbation.

What Is Being Done at Touring Board Headquarters.

But while Chairman Hower's work in connection with the annual tour is well known, few are aware of the other matters that keep him and five assistants busy every day in the year, aside from Sundays. The annual tour, heretofore known as the Glidden Tour, is a mere incident in the year's work. It is the traveling show conducted by the Touring Board to advertise the ability of touring cars and runabouts to travel any distance over American roads and to visit any Summer resort by seashore or on mountain with the maximum of enjoyment and the minimum of discomfort in traveling. It requires months of prepara-

Headquarters and Staff of Chairman Hower in the A. C. of Buffalo.

tion and volumes of correspondence, but even its preparatory period is a mere chore in the day's routine under the sign "Office of the Touring Board, A. A. A.," which marks off the front part of the assembly room of the Automobile Club of Buffalo as the "Capital of Tourdom."

The larger work of the Touring Board arises in connection with the supplying of information to tourists all over the world. Every year, the destiny of the automobile as the chosen vehicle for touring is becoming more definitely fixed. As soon as the Winter is gone and roads become settled, the hegira of auto tourists begins. Southerners lead off by starting northward for the Niagara Frontier, the Lake region, and the seashore. Westerners follow, fleeing from the midland heat to the lakes, the seashore and the mountains. The Easterners swell the caravans from the big cities, traveling from one Summer resort to another.

The auto has superseded the railroad coach in these climatic migrations. No more the stuffiness and cinders of the railroad train, the dependence upon the mercenary Sencrumbian, the passage through cuts and tunnels and the grimy parts of towns. Instead, for people even of moderate means, the flight across the landscape in autos that glide as lightly as a cloud shadow

across a meadow; the scent of wayside flowers; the caresses of the flight-created breeze; the companionship of birds; the coolness and beauty of roads through forests; the entrance and departure from cities and towns by the most beautiful streets where the people live, instead of the backyards and gables seen from train windows. It is this increasing custom of touring that is piling up work for the Touring Board, and particularly for Hower, the "Burgomeister of Tours."

Aid for 165 A. A. A. Clubs Available.

The Touring Board is composed of secretaries chosen from the 165 automobile clubs affiliated with the A. A. A. and chairmen of the touring committees of these clubs. Say that Col. Pierre Toutant Beauregard of Memphis, Tenn., desires to travel from that city to Saratoga with his family, in his touring car. Probably he writes a letter to the secretary of the automobile club to which he belongs. In any event, the letter is forwarded to Chairman Hower and his assistants get busy. They are busy, anyway, for about 300 such letters are received daily. They resort to files arranged alphabetically where routes and route maps are stored away. Back to Memphis by return mail goes a fat envelope filled with the information which Col. Beauregard desires to know. He is conducted from city to city from Memphis to Saratoga. The furnishing of this information implies vast preliminary work. The board is in constant communication with all of the secretaries and touring committees of the 165 affiliated clubs, seeking information concerning routes. Clubs are encouraged to lay out touring routes to the nearest cities.

Information and Aid for Those Who Go Abroad.

Another useful function taken up by the Touring Board is the furnishing of information to tourists who wish to take their cars abroad. Representatives of the Touring Board in foreign countries are in constant communication with the Buffalo headquarters, furnishing the latest information obtainable in regard to customs charges, speed restrictions, chauffeurs' licenses, and routes, so that any member of a club affiliated with the A. A. A. or any individual member may start for Europe equipped with all essential information. Arrangements are also made for him whereby an express company will take charge of the shipping of

his car through all of the customs houses he may encounter between his departure and arrival home.

A. A. A. Clubs Are Placing Many Signboards.

Still another field of usefulness of the A. A. A. Touring Board is the promotion of signboards at crossroads all over the country. The Board has made arrangements with a firm of manufacturers to supply any number of signs at \$1 apiece. The planting of these signs in places where they will do the most good is urged upon the various affiliated clubs. Under the encouragement of the Touring Board, these signs are springing up all over the country. They give the distances between cities along prominent routes and trunk line roads, indicating the way by unerring arrows.

The registration of non-hold-up hotels has been begun this year, and is expected to be completed as far as the route of the reliability tour is concerned in time for publication. Every hotel-keeper in every city along the route has been written to, urging him to send in the regular rates of his hotel. The same system has been employed to secure a trustworthy list of official one-price garages. Ultimately, the list of hotels and garages will include every tourist route in the land.

A NOTABLE WESTCHESTER COUNTY TRAP.

During the greater part of 1907 Merritt Corners (in Westchester county, on the most-used road to and from Briarcliff Manor) was made more or less famous by the "trap" maintained there practically all of the season by the country justice. His persistence and methods made it appear practically certain that the financial returns were one of the objects of the "trap," to which a large number contributed unwillingly, especially on Sundays and holidays.

The "justice" is on hand again for 1908, with his "trap" in the same good working order it was during 1907, but with the exception that he has moved it a trifle to the south, near the well-known "S curve" at Echo Lake. This was evidently done to take unawares those who might be forewarned of the "trap" at Merritt Corners, and another reason for moving it down to this point was doubtless to "catch" a number who could not very well go around the curves at that point at "four miles an hour," which the justice seeks to enforce.

Within the past week one accident has occurred at this point, due to the fact that the constable stopped a car in the middle of the road, and would not allow the driver even to pull it to one side. This was clearly carrying matters too far, and when another automobile came up from the rear and ran into the stalled car (something that could hardly have been prevented under the circumstances, no matter how slowly one might be driving around the bad curves at that point), the owner of the car was thoroughly aroused. At the present time plans are formulating to sue the township for the damage done the car under these circumstances, and the result of the contest, which will be pursued with vigor, will be awaited with interest.

DIXIE IS ALSO ALIVE TO AUTO DOINGS.

Automobiling is gaining in the South, and these items, culled from Southern newspapers, tell the story of progress.

The automobile from West Point passed through our community Sunday, causing several horses to get badly frightened. No one was hurt.—"Opellka (Ala.) Post."

An automobile line, with hourly trips between Jacksonville and Anniston, is being discussed at both places.—"Montgomery (Ala.) Advertiser."

Dr. Payne has an automobile now. We expect to hear of several more in the near future.—"Anderson (S. C.) Intelligencer."

The use of automobiles is becoming more and more general throughout Tennessee. This fact is shown by the number of automobile licenses which are being granted in the office of Secretary of State Morton. Recently these licenses have been granted at the rate of three or more each day. Since January 1, 1908, a total of 83 licenses have been issued. This does not include between fifteen and twenty transfers which have been recorded.—"Nashville (Tenn.) Banner."

Well-traveled Long Island Road, Included In Greater New York, Illustrating Dust Problem Unrelieved.

THE ONE QUESTION OF THE DAY: THE ROAD PROBLEM

By SIR JOHN H. A. MACDONALD, K.C.B., IN "THE MOTOR," OF LONDON.

FOR fifty years the road—after the advent of railways—was looked upon as a more or less negligible quantity in national affairs. One could ride or drive for a whole day without meeting one vehicle in every half mile, and, on some roads, on which at the beginning of the nineteenth century there was a considerable amount of traffic, not a single carriage of any kind would pass in an hour. To keep up roads in good condition for such sparse traffic would have been waste of labor and of money. During the latter half of the century all the roads were suffered to deteriorate. People grumbled, but that was all. There was an instinctive feeling that to seriously ask for anything better meant an increase of tax rates without any corresponding practical gain. It was in this condition of things that our highways were found when the advent of power traction revived the road as a means of long-distance communication. They were unfit for use as roads in the sense of being really ways for traffic.

Such having been the state of things, it is not to be wondered at when the roads began to be used once more and a hundred vehicles passed in a day where five passed formerly, that the wear and tear on these villainously ill-constructed and ill-tended roads should have caused much breaking up of surfaces, and called for more outlay to put and keep in efficient order. Of course, the blame was laid on the motor car. It was declared that it injured the roads more than did the horse traffic. This was quite untrue. The advent of the motor carriage added largely to the number of vehicles upon the road, and it was this, combined with the fact that the roads were already bad and incapable of carrying horse traffic without injury, which caused the outcry. **But it was not realized that if horse traffic had suddenly been increased by several hundred per cent. on the ill-laid and ill-tended roads the destructive effect would have been infinitely greater.** This was not appreciated at first by Roads Boards and District Councils.

The cry was that power traction must be prohibited on the existing roads. On every hand one met with the suggestion that the motorist should be ordered off the roads and must have roads made for himself and not put his wheels on those already existing. It appeared to be the idea of those who had not taken up the new mode of road transit that the traffic should be regulated to suit the roads that were provided, however bad they might be, rather than that when there was a development of traffic the road should be kept up so as to carry it. The things that were said put one in mind of the story of the mother who made it a matter of complaint against her child that when she had provided—as she thought—suitable clothes, it had the impudence to grow out of them, and that if it chose to get so big as that it should find its own clothes.

The time has come when the motorist, in his own interest—

which is, in the end, the interest of the whole community—must put forth every energy for obtaining improvement of the roads. He must din it into the ears of those who are dull of hearing on the matter that in improvement of the roads is to be found relief for present discomfort, convenience for pleasure and for commerce, economy in locomotion expense and great increase to the national wealth. Those who will not hear must be made to hear this; those who will not see what is before their eyes must be made to see.

There is no one now, who is not a fanatic or a lunatic in hatred of power traction, who does not know and confess, however reluctantly, that **the power vehicle is a permanency on our roads**, and that road traffic is becoming as important as it used to be in the days of the mailcoach and the carrier's cart. And, as the population is so enormously increased since those days, the actual number of vehicles put upon the road will be very much greater than it has ever been before. The roads which were narrowed by converting their sides into green pastures for cottagers' cattle and hay-making grounds for the food of the road authorities' horses, must once more be widened to the extent necessary for safety and convenience. The most scientific system of road making must be adopted and efficiently carried out.

Locomotion will always be cheaper on good roads than on bad. For it will be faster and less injurious to the power used for haulage and to the vehicles. This is well illustrated by what happened in the early days, when the coach began to supersede the horse as the traveler's means of conveyance. Two instances will suffice. The first coach service between London and Dover, a distance of a little more than eighty miles, took three days to make the journey. The first coach service in Scotland, between Edinburgh and Glasgow, required two days to accomplish the distance, although it was only forty-two miles. Does anyone doubt that the improvement of the roads which made it possible for these journeys and other similar journeys to be completed in half the time taken at first did not constitute an addition to the wealth-producing power of the country, diminishing the cost of wear and tear of animals and carriages, and the expense of the journeys to travelers, and facilitating the rapid transaction of business by intercommunication between one place and another being accelerated.

Everyone who is interested in motor traction, whether for pleasure or social purposes, whether for business facility or goods transit, or has the still more direct interest of being engaged in the manufacture of or dealing in power vehicles for whatever purpose, will act wisely if he devotes some energy to enforcing upon our authorities, legislative or administrative, **the necessity of the present great revival of road use being encouraged by a wise and courageous policy of improving the**

roads, as a certain means of adding to the financial and social prosperity of the nation.

Let it be borne in mind that we are a race which is not easily moved out of a groove into which we have been led or have fallen. The British temperament is well expressed in the oft-repeated saying that, "what was good enough for my grandfather is good enough for me." When the three-days' coach service was organized between London and Dover it was denounced in the public prints as an uncalled-for innovation, and it was declared emphatically that no such rapid, rushing service (?) was required. In the same way, when the first hackney vehicle was put upon the streets of London, running about six or seven miles an hour, it was inveighed against by people, who maintained that no citizen's life would be safe if such carriage were allowed to ply at these dangerous speeds in the streets.

Well, a great deal has happened since then, and a great deal more is going to happen now. The establishment of what was called fast (?) traffic in those early days led up to the study of the road, which had its results in the great achievements of Macadam, who, be it remembered, began his work as an amateur

enthusiast. The establishment of power traction on roads—and it is established permanently and forever—will have the same result. But that it may be as little delayed as possible, and that all may benefit by it now, and not later, it should be taken up vigorously. This has been done in measure already, but it has only been one of the many things engaging the attention of the best mechanical engineers.

The time has come when the road is the one question of the day. **The motor vehicle is now a thoroughly practical instrument for locomotion, whether for passenger or goods traffic.** That its efficiency may not be handicapped by the badness of roads is the question of the hour—the one great question which it is the duty of all motor organizations and all motorists to press upon public attention and upon which it is a duty to give the authorities no rest until the work of road improvement is taken up in a thorough manner, and pushed on vigorously. That good roads can be made at a reasonable expenditure, when initial cost and subsequent maintenance are put together, is certain. The only thing that is uncertain is how long it will take to overcome the visinertia of officialdom.

THE PRESERVATION OF IMPROVED ROADS IN NEW JERSEY

BY ROBERT A. MEEKER, NEW JERSEY STATE SUPERVISOR OF ROADS, IN ANNUAL REPORT.

OUR good roads are becoming so worn by the continually increasing automobile traffic that the problem of maintaining them in their fine condition is one that confronts us constantly. What shall we do? How shall we do it? Is there any known substance that will withstand the constant attrition of rapidly revolving auto tires? If not, is there any remedy that will reduce the cost of maintenance and prolong the life of our hard roads? Many answers have been made to these questions, many methods have been suggested and tried, many materials have been tested, and still the problem is not solved. Extremists on both sides have come forward and argued loud and long. The aggrieved property owners propose that the roads be allowed to wear down to the large stone, when they will be so rough that the autoist will avoid them. Then, say they, the dust nuisance will be abated, and the highways will be safe and convenient for pedestrian and horseman.

The enthusiastic automobilist says the roads should be kept in constant and perfect repair; that no ruts should be allowed to form, and that no holes large enough to hold a pail of water should ever be permitted on the surface. "True," replies the resident taxpayer, "but who is going to pay the bills in order that he may enjoy the pleasure of having his lungs, lawn and house filled with stone dust?" The autoist replies, "We pay a license fee and an occasional fine, which help to maintain the roads." Mr. Taxpayer scornfully answers, "Yes, about one-eighth of the cost." Thus the merry war goes on, and we are no nearer the solution of this vexed problem than when it first presented itself.

The conservatives of both sides feel that something should be

done, and that there is something of truth in the contentions of each side, hence have proposed many methods of relief. The first and most natural is that of sprinkling with water. This lays the dust and cements the surface, but must be repeated so often that it is too expensive, hence many other substances have been tried, with varying degrees of success. Among these may be mentioned crude oil, coal tar, asphaltum oil, applied hot or in solution with ammonia, and compounds having the power of absorbing the suspended moisture of the atmosphere, the most common of which last is salt, but none have thus far proven entirely satisfactory. Either they are too costly or the results, if good, are only transient.

A careful study of the problem on the New Jersey roads leads us to the conclusion that there is only one remedy; that is, to distribute the traffic. To this end it will be necessary to build practically parallel roads between our principal cities and resorts, at the same time widening our old roads, thus dividing and distributing the travel, and likewise the wear.

We have some such routes now. By building a few short links here and there we can increase their number, and if at the same time the old roads are widened, the travel will be divided and distributed to such an extent that the wear will be materially diminished. This proposition is entirely feasible, as a glance at our road will quickly show.

The construction of these short stretches will not only distribute and consequently reduce the wear, but will also open up new territory to development, and thus enhance property values, as well as promote the comfort of all the people, whether they live beside or travel over our improved roads.

SPOKANE MOTOR CLUB INAUGURATES A FARMERS' DAY

SPOKANE, WASH., May 22.—What appears to be the most progressive move in the good roads campaign has been originated by the Spokane Motor Club, and will be carried into effect as soon as the necessary preparations can be made. Members of the club and other autoists interested in the movement are to assemble with their cars at a given rendezvous on the date set, the farmers for miles round having been previously invited to do likewise. Each car will be given over to the transportation of a farmer and his family from the central gathering point, and the farmer will be given an opportunity of judging of the condition of roads traveled over from the autoist's standpoint.

The real object of the "farmers' day" is to destroy the last remaining vestige of prejudice against the automobile. The autoists will meet the agriculturists more than half way, and will make the most of the opportunity thus presented, to state their case to the farmer in a way that the latter can appreciate as he will be in a position to see things as they are viewed by the autoist. The Northwest Automobile Company, Franklin representatives at Spokane, have been largely instrumental in fostering the idea of a "farmers' day."

It is hoped that the movement thus inaugurated will be taken up by automobile clubs throughout the country.

AUTO ENTHUSIASM BOOMING IN SOUTHWEST

By F. S. SLY, TRAVELING CORRESPONDENT FOR "THE AUTOMOBILE."

FORT WORTH, TEX.—This is my last stop in Texas, and it is easy to see that business is in a good condition here, even without the dealers' statement to that effect.

There are about 130 cars in the city, but as yet no club has been organized. The roads are simply of dirt formation, but are good during the dry weather, though not so favorable after it has been raining for some time. At the present time, an improved form of gravel road is under construction to connect this city with Dallas.

There are four garages, run by Hamilton Clough, who handles the Stoddard-Dayton, Jackson, and Jewell; Thomas Abbott, who has the Maxwell; H. H. Lewis, representing the Buick, and F. J. Boas, who does not do any agency business.

A Typical Garage Building in Ft. Worth, Texas.

From what I have seen of Texas, it is easy to appreciate that it is a State that will ultimately come to be one of the largest users of automobiles in the country, population considered. It is truly a State of magnificent distances, and the average Easterner who has heard the same expression used in connection with more or less familiar things at home, can form no conception of what it means out here.

Oklahoma Citizens Are Strong Buyers.

OKLAHOMA CITY, OKLA.—Here is a boom center in automobiling without a doubt, as none of the cities that I have been in since striking this part of the country has had half as favorable report to make. It is reported that the Oklahoma Motor Car Company has contracted for no less than 200 of the small four-cylinder Fords and 50 of the six-cylinder type.

A very large part of this firm's business is with the farmers, to whom a great many of the small cars are sold. It can boast of one of the largest and best equipped salesrooms and garages that I have seen since leaving New York City.

There are now about 250 cars in use in Oklahoma City, and they are being added to at the rate of fully 30 a month, or practically one a day, from which you can judge of the extent of the autoing enthusiasm here.

In spite of this, however, the town cannot as yet boast of a club. The roads through the entire territory are nothing but the old wagon trails and are in exactly the condition that the wagons left them, but they are quite passable in dry weather, even at that. A few of them have been "worked," but so far as I can learn there has been little or no actual road building, as we know it in the East.

In addition to the Oklahoma Motor Car Company, which handles the Ford, Rambler, and Pope-Waverley electrics, there is the Severn Auto Company, representing the Cadillac; Fritz Brothers, the Reo and Premier; Alko Garage, handling the

Pope-Toledo; C. F. Elerick, the Tourist, and the John Deer Plow Company, the Moline. Every one of these concerns maintains a garage, beside which there is the Jeffreys Auto Company, which also runs a garage but does not sell any new cars.

Little Rock, Ark., Is Progressing Well.

LITTLE ROCK, ARK.—Although there are about 65 cars in use here, beside a flourishing club of 25 members, of which Moorehead Wright is president; Irving S. Hirsch, secretary, and Perry Stiff, treasurer, there is but one concern in the automobile business. This is the Little Rock Auto Company, which handles the Franklin and the Buick and runs the only garage. Mr. Ladd, the president of this company, reports that business is very much better than it was last year at this time.

The club has not been organized long enough as yet to have accomplished much, but expects to do a great deal during the coming summer toward arousing auto enthusiasm. Among other events, a run is planned to Memphis, and will be held some time this month. There are several good roads leading out of the city, and the ordinary country roads are in very good condition in dry weather, although they are quite the reverse when it is wet.

Arkansans Are Enthusiastic Autoists.

FORT SMITH, ARK.—But eighteen months ago this town could boast of exactly two automobiles and half the population had a habit of coming out to "rubber" every time one of them went by, while their simultaneous appearance on the street in one place drew a crowd that all but impeded their progress. Now

One of Oklahoma's Representative Business Houses.

there are not only 42 cars owned here, but every owner, as well as the dealers, belongs to the Ft. Smith Auto Club, a progressive step in the organization line that might well be patterned after by many cities having vastly more cars in use. John Vaile is president of the local club; George Lyman, vice-president, and Fred Reutzel, secretary and treasurer.

The club is becoming a great power in the good roads movement throughout the State, and has even repaired several short stretches of bad road at its own expense. There are a number of macadamized roads running out of the city in different directions.

The Ft. Smith Auto & Supply Company has just completed a modern garage and salesroom of which many a larger city could well be proud. This concern runs the only garage here, and in addition handles the Franklin and the Buick, while W. T. Blocker represents the Ford, and Gus Boehmer handles the Reo. For the past few months business is reported as having been a little backward, but the prospects for the season are good.

EFFECTIVE TIRE PROTECTORS THAT ARE EASILY MADE

By A. D. HARD, M.D., MARSHALL, MINN.

THE rough and rutty roads of the West call for more than ordinary provisions against wear on pneumatic tires, especially on the sides where the hard baked ground forming the walls of deep ruts tears the rubber from the fabric and then quickly prepares the casing for a first-class blowout. I have tried almost everything which has been suggested to enable me to disregard road conditions and still have a little rubber left on my rims. I now use the device which I am about to describe, because it is far ahead of anything which can be purchased for the purpose where effective service and small cost are concerned. I have briefly spoken of this home-made tire protector before in *THE AUTOMOBILE*, and, as a result, have had so many letters inquiring how it is made that I am compelled to answer them all with this one reply.

My automobile has clincher tires, 30 by 3½ inches, and this description applies to that size, though any sized tire may be used by varying the measurements to suit. My protector is made of casings which have been discarded because of rim cuts, blowouts

How the Home-made Tire Protector is Fastened.

or other injury, not being completely worn out. The old casing is cut in two, cross section, choosing an injured part if there be one, so that it may be eliminated by cutting off the injured part from one end. The beads which fit into the flanges of the rim are then cut off with a stout knife, and the protector is placed around the tire that it is intended to protect. If the old casing has not been shortened to get rid of some bad portion, the protector will lack four inches of surrounding the wheel, which may be filled in by a small section of another old casing.

This short piece may be fastened securely by using several wire belt links, with the points on the outside, to unite it to the ends of the old casing. Opposite every other spoke a mark should be made on the sides of the old casing, beginning with the spoke which should be in the middle of the small section. Three inches on either side of these marks, and about ¼-inch in from the margin, holes should be made through the walls of the old casing with a ¼-inch punch, such as is used by harnessmakers for heavy leather. Pieces of number 9 galvanized iron wire 12 inches long are bent like a wide-open V, and hooks one and one-half inch long bent on the ends, the hooks at right angles to the plane of the V. These wires are hooked through the holes in the sides of the casing with the points outward, and the ends bent down and around the base wire. This will give six retaining wire loops on each side, spaced to come opposite each other, and in line with the six alternate spokes of the wheel.

Half-inch wide rawhide straps fifteen inches long are then used to hold the protector on, each strap passing through the

V-shaped wire loops on either side of the wheel, and on both sides of the spoke. These six straps are drawn moderately tight before the tire is pumped up, and when inflated the protector should fit quite snugly all around. The wires on the sides serve not only to hold the protector in place, but they protect the shoe from side wear in ruts. The tread will not wear off as fast as the tread of an ordinary tire, because it is not under similar tension, the surface yielding somewhat to any tearing action of road impediments, instead of being gouged out. Dust will get into the space between the tire and protector, but it will quickly work out at the point where the short section is spliced in, and will do no harm. If these protectors are placed only on the front wheels they still will save the wear on the rear tires almost as much as though they were also similarly covered. This is due to the fact that the protector increases the diameter of the front tires about three-fourths of an inch, and this increase in size serves to make a path for the rear wheel which is larger than the rear wheel tires.

If placed on the rear wheels it increases the speed of the car by increasing the diameter of the drive wheels. Nearly all injury to tires is guarded against by this form of protector, and the tire may be pumped up much tighter than ordinarily, yet not decrease the resiliency, because of the extra amount of yielding rubber on the tread. Cuts and surface injuries are taken by the cheap protector, saving the expensive tire. Running on a deflated tire thus protected does but little harm, as the large amount of rubber between the rim and the ground obviates bruising of the tire and rim cutting.

Very few rails are long enough to go through both protector and tire to produce punctures, and the fabric of the tire never becomes exposed by wear to the destructive action of water or oil. Tires do not heat in use, because the large amount of heat conducting material in contact with the tire quickly dissipates the heat. If placed over a worn and weakened casing the tendency to blow-outs and other injuries is obviated, and the old casing can be trusted to wear about as long as a new one would without the protector. The cost of these protectors is almost nothing. If the old casings are valued at seven cents per pound as old rubber they are worth about one dollar each. The labor and straps will not cost to exceed a dollar and a half for each protector, making them cost only five dollars a pair, and they are better than any leather tread ever made at any price. The enclosed photograph shows how the protector looks on the wheel, and will serve to more fully explain my plan of construction.

AKRON'S TIRE FACTORIES IN FULL BLAST.

AKRON, O., May 25.—There is no panic among tire manufacturers at present. Never before were tires ever put out in such quantities in this city as at present. What surprises the manufacturers at present is the permanency of the movement. A month or more ago there was noticed a sudden increase in orders for automobile tires, and the manufacturers replaced their full force of tiremakers which almost entirely had been laid off during the winter months, when trade was at a standstill. The little spurt, as manufacturers chose to call it, was attributed to the re-equipping of 1907 machines by owners and not to any demand for 1908 cars, and it was expected that the rush would be soon over.

But there has been no let-up as yet, and at present the Goodrich, Diamond, Goodyear, Firestone and other local companies are working their fullest capacity to supply the demand. An official of the Goodrich company said this week: "We are far behind our orders and cannot begin to manufacture fast enough to keep up with the trade. The rush of orders has grown into an avalanche, and we believe that the activity will continue. The local tire plants began running night shifts a month ago."

THE other day in Paris four blasé individuals were sitting, in the mid-afternoon, on the terrace of a café in the Boulevard Montmartre, just where the Rue Montmartre crosses that busy thoroughfare. One of these individuals suggested a race to the Café de la Paix, half a kilometer away, down hill and along the Boulevard des Italiens, through that always dense throng of busy folk and idlers, and across the Place de l'Opera, as congested a public square as one finds anywhere in the world, save at the entrance to Brooklyn bridge in New York City during the rush hours.

Paris street traffic is commonly supposed to be entirely unregulated, and the Englishman, used to the admirably controlled traffic of London streets, protests loudly, if unintelligibly, each time he is nearly run down by the careering Paris *cocher* and his *sapin*. All is not lawlessness, however, the Paris *agent de police* and his white baton held in air is now a common, if unliked figure at the corners of many crowded Paris streets and as far as his services go they are fairly efficient, though not yet up to the London standard.

New traffic regulations had just gone into effect and the four confident Parisians each chose for himself the means of making the *étape* between Paris' two popular cafés. One chose an ordinary cab, the *voiture à cheval* or *sapin* indigenous to Paris; another an autotaximeter, as being more speedy after it once got to moving; the third elected to go by autobus, and the fourth simply started out to walk.

The distance was not great to be sure, but the conditions were sufficiently arduous to make the affair interesting though the stakes were simply *aperitifs*, the Frenchman's substitute for the "five o'clock" at the Café de la Paix, opposite the French Académie Nationale de Musique, which all the world knows as "The Opera."

RESULTS: The autobus and the man on foot arrived in a dead heat; the walker simply wormed his way in and out of the slow-moving traffic and finally arrived; the autobus which carried the other winner did practically the same thing, though the chauffeur was put on his mettle by an ample *pourboire*; and by a fortunate position in the slow-moving, wriggling line of traffic succeeded in blocking the auto-taxi on two or three occasions, and so crossed the Place de l'Opera and deposited the winner

AN ORIGINAL RACE

at the same time and place as the man on foot arrived. Time, nine minutes, not too fast for safety, one thinks; but then there are those exceedingly difficult conditions to take into

consideration. The cab or *fiacre* was hopelessly behind, and only arrived at the end of thirteen minutes, having been blocked en route here and there on the roadway by the traffic.

The auto-taxi arrived in eleven minutes, two minutes after the autobus, and two minutes before the *fiacre*.

The autobus met the following obstructions en route, all of which it passed magnificently, handled intelligently as it was by its *mécanicien*—the Paris omnibus company has *mécaniciens* in charge of its autobuses, not merely chauffeurs. Perhaps that's why they are so well handled.

The autobus had stopped at the corner of the Rue Montmartre, and our lucky concurrent mounted the back platform just as the *mécanicien* let in the clutch and swung the vast rattling omnibus out into a twenty-five-foot open space that his eagle eye had chanced upon just at that moment.

Just beyond there was a horrible tangle, which, however, straightened itself out automatically with but a moment of time lost. At the Rue Richelieu came the second stop, but they were almost at once en route again, at a speed of certainly not more than four kilometers an hour, a long line of cabs, carts and omnibuses streaming along in Indian file. Opposite the Credit Lyonnais, as luck would have it, came a chance at last to get on "top speed." The gears were changed with a crash, and off the autobus went—for perhaps 50 meters. At the Rue Chaussée d'Antin a complete stop. Then making way again, another stop just before reaching the Place de l'Opera, the simple white baton of a Paris policeman barring the way.

Two minutes' wait, then a rush across to the Café de la Paix on the opposite side of the Place. "Stoppe!" said the intrepid voyager to the conductor as he prepared to descend. But there on the pavement beside him was the man on foot.

The problem would seem to solve itself thus: that all automobile traffic—automobiles, autobuses, and auto-taxis—should have special thoroughfares set apart for their use. Then, and then only, will the new locomotion become, in the cities, really efficient. Perhaps some day this millennium will arrive, before familiar on the Acme stock cars during the past few years.

CONCERNING THE ACME RACER FOR VANDERBILT CUP RACE

THERE will be at least one six-cylinder car entered for the Vanderbilt Cup race, advices from the builders of the Acme being to the effect that their entry will be of this type. The entry of a multi-cylinder car in a classic road event is nothing startlingly novel, sixes and even an "eight," having figured in the elimination trials for the Vanderbilt years ago, but the entry of a six-cylinder at this time is particularly interesting, owing to the great amount of discussion that has been going on regarding the various advantages embodied in this type, as compared with cars provided with the smaller four-cylinder engine.

Apart from the fact that the motor for the Acme entry is to be of the six-cylinder type, and that its dimensions will be 5 inches "square," i.e., bore and stroke the same, nothing is as yet forthcoming regarding its design or construction, although it is to be presumed that this will be something differing from the usual Acme standards as represented by the touring cars of the latter make, although it is stated that in all other respects the Acme Vanderbilt racer will closely adhere to the construction

familiar on the Acme stock cars during the past few years.

An interesting question has arisen over the fact that some of the material that will go into this racing car is of foreign origin, much of the steel being the Krupp chrome nickel, which is specified for such parts as the shafts and gears of the change speed gear set. This is the material used by the makers in the building of their stock cars, but in view of the fact that the rules governing the race specify that racing cars must be constructed in their entirety in the country which they are entered to represent, it was thought necessary to obtain a special ruling on this point in order to definitely settle the question thus raised. However, it will be noted that the rules only specify that the construction must be carried out entirely in the country of the car's origin, and that they are silent when it comes to the question of the origin of the materials. Therefore, there is not likely to be any difficulty so far as this is concerned. Good progress has been made in the building of the car and it is expected that it will be ready for its first road trials at an early date so as to have plenty of time for tuning up.

AERONAUT GLIDDEN AFTER LICENSE.

PARIS, May 22.—Both Delagrance and Farman have temporarily abandoned the Issy-les-Molineaux ground, and the vast military field is as deserted as ever it was before the advent of aeronauts. Leon Delagrance has shipped his Voisin apparatus to Rome, and has left, together with one of the Voisin brothers and a staff of mechanics, to attempt a fifteen-minute flight for an \$8,000 prize, offered by the Turin Association. Farman, who has been searching for a new training ground near Ghent, in Belgium, will doubtless follow his rival, and attempt to snatch from him the time record in Italy. Later he will make attempts on the open ground at Ghent, first with his present machine, and later with the Flying Fish that Voisin is now completing and that Renault is fitting with an eight-cylinder air-cooled engine.

America is at present actively represented at the Aero Club of France Park on the Saint-Cloud ground by Tourist Glidden and Aeronaut McCoy. The latest ascent of the two Americans was a trip from the Saint-Cloud ground to Villeneuve St. George to the South of Paris. Mr. Glidden intends to get his diploma as a pilot of the Aero Club of France before returning to the States.

RAIN CAUSES ATLANTA RUN POSTPONEMENT.

ATLANTA, GA., May 23.—Owing to the constant rains that have prevailed for the past three weeks, the Atlanta-Macon endurance contest promoted by the *Atlanta Journal*, has been postponed for three weeks or more, being set for some time in June. The deferred date has not been definitely decided and will depend upon road conditions as the latter are what caused the postponement. The long continued wet weather has been responsible for putting the roads in very poor condition and it is generally considered that it will take some time for them to become fit to run the event on.

The committee appointed to fix the distance table which will form the basis for the official running schedule, went over the course recently in Professor J. H. Smith's Pope-Hartford. Professor Smith is chairman of the committee and drove his fellow members over the course. They are Dr. Thomas P. Hinman, Charles Elyea and John E. Smith. The total distance one way between Atlanta and Macon is 95.3 miles, and it is anticipated that controls will be established at Griffin, 39.9 miles, and Barnesville, 56.4 miles, in addition to those at the start and turning point.

WILL BE GOOD SPORT AT DELAWARE'S GAP.

PHILADELPHIA, May 23.—The *Public Ledger's* four-day tournament in the Poconos promises to be even more successful than its projectors had hoped for. That portion of the local automobile contingent that is always going round with a chip on its shoulder has become interested, and June 24, 25, 26, and 27 will in all likelihood witness an exodus to the Monroe county mountains. Louis J. Bergdoll, the local amateur crack, ran up to Stroudsburg last week to size up the possibilities of the coming tournament. He found the hill at the Gap all that the managers of the tournament said it was—a course that would demonstrate the merits of the best cars and drivers. He also pronounced the rise at Canadensis an ideal course for a hill climb "on the high," and it has been decided to give drivers in the open classes an opportunity to try their cars on this hill for separate trophies.

The routes for the double-header endurance run on the first day, June 24, from New York and Philadelphia, have been selected. From the metropolis the route to Stroudsburg will be via Tarrytown, Middletown, Port Jervis, Milford, and Bushville. From Philadelphia the contestants will journey via Doylestown, Easton, Portland and the Delaware Water Gap, thus avoiding the necessity of going through the State of New Jersey with its prohibitive license laws. The route around the anti-automobile State is much more picturesque.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit. Thrd Annual Summer Meeting of Society of Automobile Engineers.
 Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
 January, 1909.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
 February, 1909.....—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Race Meets, Hill Climbs, Etc.

- May 30.....—Boston, Readville Track, Race Meet. Bay State Automobile Association.
 May 29-30.....—Minneapolis, Minn., 300-mile Endurance Run, Minneapolis Automobile Club.
 May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
 May 30.....—Wilkes-Barre, Pa., Giant's Despair Hill Climb, Automobile Club of Wilkes-Barre.
 May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers Association.
 June 5.....—Jamaica, L. I., Straightaway Time Trials, Long Island Subway Celebration Committee, Assisted by Long Island Automobile Club.
 June 6.....—Worcester, Mass., Dead Horse Hill Climb, Worcester Automobile Club.
 June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
 July 4.....—Lowell, Mass., 250-mile Road Race, Lowell Automobile Club.
 July 4.....—Wildwood-by-the-Sea, N. J., Annual Speed Tournament, Motor Club of Wildwood.
 July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
 July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
 Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
 Sept. 11.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
 December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
 May 31.....—Russia, St. Petersburg to Moscow Race.
 June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
 June 14.....—Mount Cenis Hill Climb, for Voltorettes.
 June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial A. C.
 June 15-19.....—Scotland, Scottish Reliability Trials.
 July 6.....—Volturette Grand Prix, Dieppe Circuit (Automobile Club of France).
 July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
 July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
 Aug. 12.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
 Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
 Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
 Sept. 1-8.....—French Volturette Contest, Auspices "L'Auto."
 Sept. 6.....—Bologna, Italy, Florio Cup Race, Automobile Club of Bologna.
 Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

SICILIAN WINNER TO COMPETE IN "LITTLE" GRAND PRIX

PALERMO, SICILY, May 15.—With a little one-lunger measuring but 3.9 inches bore, an average speed of 28.5 miles an hour has been accomplished in Europe's first road race of the season, over 186 miles of the most tortuous, precipitous, and mountainous road of this mountainous country. Giuppone, ex-cyclist and motor-cyclist, is the man who has won the Sicilian vioturette race, his little Lion-Peugeot, which led him to victory having the honor of beating the heavy car record established two years ago by Cagno.

There were eleven starters lined up in Indian file opposite the splendidly decorated stands at Bonformello at 7 A. M. of Sunday, May 10, the head of the line being held by Naudin on a Sizaire-Naudin, a position which was given him because of his victory last year.

Mechanically France only was represented in the race, the three firms engaged being Lion-Peugeot, Sizaire-Naudin, and De Dion. Among the drivers the tricolor had not all the honors, for Vincenzo Florio, donator of the cup and founder of the Targa which bears his name, was at the wheel of one of the small two-cylinder De Dions. Giuppone, the winner, also claimed Italy as his patrie.

At the end of the first of the two rounds, a distance of 93 miles, Guippone was at the head, his Lion-Peugeot having covered the mountainous course in 3:16:53. Vincenzo Florio had abandoned, together with three other competitors.

The length of the course made it somewhat uninteresting for the spectators, and it would have been really dull but for the admirable telegraphic service which early on the second round brought in news of the overturning of both Naudin and Sizaire, without, however, any accident to the men. Giuppone's victory

was then practically certain. Summarized, the result of the race is:

Lion-Peugeot; driver, Giuppone; average, 28.5 miles an hour.	6:31:30
De Dion; driver, Cammarata.....	6:50:49
De Dion; driver, Isaca.....	7:11:39
De Dion; driver, Olsen.....	8:07:06

The winning car was a single cylinder of 3.9 inches bore and 5.5 inches stroke. Unlike most of the French voituettes, final

Giuppone, Lion-Peugeot, Winner of the Sicilian Voiturette Race.

drive was by double sidechains. The De Dion cars all had two-cylinder engines of 4.9 inches bore. The winning Lion-Peugeot as well as the two Sizaire-Naudins are engaged to compete in the voiturette Grand Prix on the Dieppe circuit.

GRAND PRIX ENTRIES MAY BE INCREASED TO FORTY-EIGHT

PARIS, May 22.—It is most likely that there will be 48 cars to start in the French Grand Prix, July 7, for Mors, though not yet officially engaged, has three racers under construction and declares that the double entrance fees will be forwarded to the Place de la Concorde before the end of the month. Since the early days, when success came by leaps and bounds, there have been hard times at the Mors factory and a closing down last year which at one moment looked like a permanent cessation. New financial interests and more vigorous management have recently made a complete transformation and a return to the racing game is one portion of the modern program. Jenatzy has been engaged as racing driver, his two companions yet remaining to be chosen to pilot the other cars of the same nationality.

The four-cylinder cars, the first of which will leave the factory

for road tests this week, have the maximum bore of 155 millimeters and a stroke of 170, which translates to about 6.6. A feature of the engine is that the four separately cast cylinders are double jacketed, one jacket enclosing the circulating water and the other some special substance, the nature of which will not be revealed, for carrying of heat. The details of this feature of the engine are being kept secret. Valve operation, as on so many Grand Prix racers, is by overhead rocker arm, both inlet and exhaust valves being in the head. Main drive has been adopted, the gear set and differential being in one casing, proving three speeds forward and reverse by independent lever. It is declared that the engine has developed 120 horsepower on the testing block and that the maximum speed on the level is 85 miles an hour.

CIRCUIT ARDENNES TO BE HELD AUGUST 12.

BRUSSELS, May 22.—Belgium has decided to hold its annual automobile race on the fast Ardennes circuit under the international rule limiting bore of four-cylinder engines to 155 millimeters. This makes complete the acceptance, in Europe at any rate, of the Ostend rule, France, Italy and Belgium having adopted it and no high-power car races being held under any other conditions. The Belgian meet has been set down for August 12 on the fast Bastogne circuit, the scene of many a record-breaking race. Two other speed tests will be held the same day, one for small runabouts competing for the Crawhez Cup and the other for touring cars running for the Coupe de Liedekerke. The small races will start at 4 A. M., the powerful cars being sent away over the same course at 10 A. M. Entries are received for the 155 millimeter race until June 15.

HEMERY AND WAGNER IN RUSSIAN RACE.

PARIS, May 22.—Twenty-four cars of all categories are united for the St. Petersburg-Moscow race to be run in connection with the Moscow exhibition, May 31. Main interest lies in the class for racers of more than 130 millimeters bore, which has united a 1908 Grand Prix Benz to be driven by Hemery, a special 150-millimeter Berliet, three 1907 racers from Dietrich, two from Fiat, a Darracq, an Itala and a Mercedes. Wagner will handle last year's Targa Florio races in the 106 to 130 millimeter class, and will have as competitors a Berliet, Nagent, N. A. G., and Darracq. A British Humber and an Italian Clément are alone in the 77 to 105 millimeter class, and seven cars share the low power classes for one, two or four-cylinder engines. There is a promise of considerable automobile trade being done with Russia, a fact that is realized by French constructors.

JUST A PLAIN STATEMENT OF FACT.

The American Automobile Association is the only national body of automobilists in this country. The Automobile Club of America was the first automobile club formed in this country. When the clubs of the various European countries first instituted a congress, it was a natural sequence that the A. C. A. should have a voice and speak for this country. Subsequently the American Automobile Association, to meet the needs of the pastime and industry in this country, was organized, and to it came the control of racing and touring and other automobile activities of a general scope. Through a combination of circumstances the A. C. A. was continued as the foreign spokesman of the A. A. A., which had a somewhat varied formative period.

But a year and more ago it first gave positive evidence of the real reasons for its existence, thereby unquestionably causing the apprehension and jealousy of the Automobile Club of America, a coterie in which has tenaciously hugged the idea that the club was and should be national in its operations. Utilizing a disagreement with the New York State Automobile Association over legislative matters, and therein assuming an absolutely untenable position, the A. C. A. flocked by itself, and recently has been endeavoring to use its "foreign relations" as an asset with which to embarrass and undermine the American Automobile Association. The effort is doomed to failure, absolute and humiliating, for it is a matter of

common sense that the general good of automobiling can only be accomplished by an organization which spreads its endeavors throughout the whole country, with local clubs, State bodies, and a cordon of national officers to look after its needs.

Saddled with an enormous debt, liable for fixed annual charges of thousands of dollars, no longer interested in the profitable conduct of automobile shows, the A. C. A. must assure itself of a substantial income from some source or other, and that is why the coterie controlling it desire the overthrow of the A. A. A.—a ridiculous task on the face of it and one which will fail simply because it does not deserve to succeed.

Truly it is a pity that the pioneer club of the country should not be satisfied to be a club itself and thus fulfill its proper destiny. But the handwriting on the wall, now plainly legible, is telling the story, even to those who have been persistently blind and selfishly mistaken in their frequently misdirected efforts to advance the use of the motor-driven vehicle.

The Vanderbilt Cup race will be a bigger success than ever before, and the puerile efforts of the A. C. A. to interfere with its success will only add to the prestige of the big American event.

It is logical, however, that the A. A. A. should figure in the international congresses of the future, and when the foreign clubs comprehend the American situation and realize that it is the A. A. A. which governs in this country, then that body will be asked to speak for America instead of the A. C. A., that no longer will be able to assume a position which now does not belong to it, either logically or morally.

ONE USE FOR ABANDONED CARS.

It generally has been thought that the cars of the earlier days were of a more fleeting order than their present day successors, and, so far as length of time in the service of the same owner is concerned, this is quite true. But the mere fact that these old cars have disappeared from view completely does not necessarily imply that they have passed away for good. Many of them are commonly accounted for by the fact that they have finally reached a stage where they are only salable in remote districts, and, strange as it may seem, not a few of them are said to have found their way abroad to places where there is no great premium on the latest models, for the reason that the latter are unknown.

A very large percentage of these old timers have not passed away for good, by any means, and even though their power plants are of a degree of efficiency which would make their travel slow and halting beside their latter-day brothers, their motors will still run day in and day out, and they are being utilized in numbers for stationary power purposes, where they may last for a great many years to come. As a matter of fact, not a few instances have come to light in which an automobile is serving its owner in the dual capacity of power plant and road vehicle, occupying one rôle during business hours in the small shop in which it is the boiler, engine and other essentials of the power installation rolled into one, while during the times of its owner's leisure it takes to the road. Many oldtimers doubtless will be doing shop service long after their origin is forgotten.

DECISIVE VANDERBILT ACTION BY A. A. A. RACING BOARD

THE Vanderbilt Cup Race for 1908 will be conducted under the rules made known weeks ago. The recent so-called protests of two foreign clubs, one of which has never supplied an entrant for the race, were utterly disregarded at the largely attended meeting of the Racing Board, held Tuesday last at the A. A. A. headquarters, No. 437 Fifth avenue, New York City. These protests, transmitted through a club which is no longer connected with the national association, were considered entirely out of order under the existing circumstances.

The A. A. A. is the governing body of automobile activities in this country, including racing, and the fact having been plainly established that it was in nowise holden to the so-called international rules for 1908, it seemed a most logical deduction that Americans could decide as to the conditions under which their big annual race contest should be held. There was no question concerning the unanimity on the proposition at the Tuesday meeting, which was attended by the following:

Jefferson deMont Thompson, chairman, who presided; William K. Vanderbilt, Jr., donor of the cup; A. R. Pardington, ex-chairman of the Racing Board; Thomas Henderson, president of the National Association of Automobile Manufacturers; Percy Owen, chairman of the contests committee of the Importers' Automobile Salon; and these additional members of the board: Frank G. Webb, Long Island Automobile Club; R. L. Lippitt, Rhode Island Automobile Club; Harry W. Knights, Bay State Automobile Association; H. A. Bonnell, New Jersey Automobile and Motor Club; E. R. Thomas, Automobile Club of Buffalo; C. J. Swain, Quaker City Motor Club, Philadelphia; Rossiter Worthington, A. G. Batchelder, H. T. Clinton, New York City; Mayor George W. Tiedemann, holding the proxy of Frank C. Battey, president of the Savannah Club, and Secretary F. H. Elliott.

President W. H. Hotchkiss was also in attendance at the session, and Mr. Henderson, besides representing the N. A. A. M., was proxy for Benjamin Briscoe, of the A. M. C. M. A.

Stand Taken by French Club Most Unreasonable.

Chairman Thompson brought to the attention of the board certain protests said to have been made by the Automobile Club of France and the Royal Automobile Club of England against the rules for the Vanderbilt Cup race for the year 1908, and at the request of Mr. Vanderbilt attention was called to a letter written by him to Chairman Thompson, in part as follows:

"The stand taken by the French Club is most unreasonable, seeing that for the past three years they have not recognized the Vanderbilt Cup, and their letter to this effect, introduced at this time, would, I think, be a reminder to them that they have refused to participate in this event for reasons known only to themselves. At the same time, the Association was never asked to send its representative to the Ostend meeting held on the 15th of July, 1907, and the minutes of the meetings of the A. A. A. do not refer to any power having been vested in the Automobile Club of America to accept on behalf of the A. A. A. any resolutions adopted at this conference.

"I also wish to bring to your notice the fact that when I presented the cup to the American Automobile Association it was with the intention of giving the American automobile manufacturers a chance of competing against foreign cars in a race to be held in this country, a contest much needed here, and one that I thought would tend to raise the standard of American cars. I believe it is the universal opinion of those interested in the sport that the above stated facts have been achieved.

"It is now, in my opinion, the time for us to notify the French Club of these facts, and receive proper recognition by them."

Text of Mr. Vanderbilt's Comprehensive Resolution.

After some general discussion of the protests, this resolution by Mr. Vanderbilt, seconded by Mr. Graves, was passed unanimously:

RESOLVED: That Jefferson DeMont Thompson, the chairman of this board and of the Vanderbilt Cup Commission, be instructed to find the corresponding boards or committees of the representative automobile associations and clubs of foreign countries that

the Automobile Club of America is a local club, situated in the city of New York, without national functions or jurisdiction, and

That all communications concerning national or international affairs must be addressed to the American Automobile Association at its headquarters, No. 437 Fifth avenue, New York City, or to the chairman of its respective boards; and

That so far as the rules of the Vanderbilt Cup Race for 1908 are concerned, on receiving a communication direct from any foreign association or club concerning such rules, this board will give such communication prompt and courteous consideration.

That the above resolution is not intended to effect local events and those not national or international in their character, except that sanctions must be applied therefor to the A. A. A.

Only Three Big Events to Be Sanctioned.

Chairman Thompson then called upon President Hotchkiss to address the board on certain matters of national and international policy, and, after a full discussion, the following resolution, offered by Mr. Thomas, and seconded by Mr. Vanderbilt, who stated that he cordially supported the policy of the association in preventing outlaw contests, was unanimously adopted:

RESOLVED: That the chairman of this board be directed to notify all foreign and American clubs and associations, as well as all foreign and American manufacturers, that the American Automobile Association, the national governing body in the United States, will hereafter annually sanction but three national or international events, namely, the Vanderbilt Cup Race for racing cars, the annual touring contest for the Glidden and other trophies, and the DeMont Thompson Cup contest for stock cars; and

That, in accordance with an understanding between the American Automobile Association, the National Association of Automobile Manufacturers, and the American Motor Car Manufacturers Association, as represented in a central conference committee of three bodies, the American Automobile Association will enforce the sanctioning privilege thus committed to it by disqualifying from further contests under its sanction all manufacturers, both foreign and American, and all drivers of whatsoever nationality participating in any race or contest for which a sanction shall be refused or, after notice, withheld.

The effect of this resolution will be (a) to limit national or international contests in the United States to three great events: that for the William K. Vanderbilt, Jr., Cup for racing cars, that for the Glidden and other trophies for touring cars, and that for the DeMont Thompson Cup for stock cars, and (b) to require all clubs and promoters of racing, hill-climbing, endurance and touring contests of a local character to apply for sanctions to the American Automobile Association. Outlaw contests will be penalized by disqualifying entrants and their drivers from all future contests sanctioned by the A. A. A. This action is taken in accordance with the agreement between the American Automobile Association and the manufacturing bodies mentioned, and is intended not only to put racing and other contests absolutely in the hands of the American Automobile Association, but to keep the number of automobile contests within proper bounds.

CHAIRMAN THOMPSON AND MESSRS. VANDERBILT AND PARDINGTON REITERATED THE STATEMENT MADE AT THE MEETING OF THE RACING BOARD HELD IN APRIL THAT THERE WOULD BE A VANDERBILT CUP RACE THIS YEAR AND THAT PRIOR TO JULY 1 THE COURSE AND THE DAY OF THE RACE WOULD BE ANNOUNCED.

Upon motion of Mr. Riker, seconded by Mr. Thomas, Chairman Thompson was authorized to name a committee to prepare the entry blanks for the Vanderbilt Cup race for the year 1908, to the end that the same might be published and distributed as soon as possible after June 1. F. G. Webb, Percy Owen, and A. L. Riker were named on such committee, and immediately began work on the preparation of the entry blanks.

Chairman Thompson read a letter from President Frank C. Battey, of the Savannah Automobile Club, which stated in substance that such a club had been approached by the secretary of the Automobile Club of America, but that their club had done nothing with regard to such a race.

VANDERBILT WILL BREAK GROUND FOR MOTOR PARKWAY

BY way of formally beginning the actual work of construction of the long promised Long Island motor parkway, William K. Vanderbilt, Jr., will, on Saturday, June 6, at half past three o'clock, turn the first spadeful of earth. It has been deemed most fitting and only just that the president of the parkway company, who conceived the idea of this great metropolitan automobile speedway and by whose persevering activity this most important project has been brought to the eve of realization, has well earned this honor. It is planned to make the starting of the building of the parkway somewhat of a ceremonial event. The place selected for the beginning of the work is at a point near Central Park, Long Island, on the Barnes tract at the intersection of the Central branch of the Long Island railroad with the Jerusalem road. It is expected that there will be a large and spontaneous outpouring of autoists to do honor to the occasion.

The awarding of the contract for the laying of the course awakened the fraternity and the public at large to the fact that the promoters of the parkway scheme were not asleep. The turning of the first spadeful of dirt will confirm the promise of the contract and make sure the start and progress of the great work. The management of the Long Island Motor Parkway has been content to fight its preliminary battles without flourish of trumpets and to herald only its actual accomplishments as the campaign progressed. There were seemingly insuperable obstacles to securing an unbroken right of way; but patience and diplomacy have surmounted them and the result is that there has been secured a right of way from the village of Mineola, Garden City and Hempstead, the western terminal to Lake Ronkonkoma extending over a distance of 35 miles. Throughout the entire length, the right of way is 100 feet wide, and in many instances 200 feet. The route in its course traverses many of the beauty spots of Long Island, unknown to the ordinary tourist.

The many possibilities of the Parkway are well known and have been discussed at length by its friends and promoters. When it is considered that all highways and railroads intercepted are to be crossed either above or below grade, and that throughout the

entire distance the highway will be free from speed traps, the benefits to be derived from its use by the man who maintains a summer residence on Long Island can readily be appreciated. As a specially prepared boulevard, the holding of contests of speed, endurance and economy, under actual road conditions, is rendered feasible.

It is interesting to note that practically the same men who were present when the organization of the parkway was first undertaken, are to-day serving in the capacities then assigned to them, as directors, members of committees and officials. This demonstrates the fixedness of purpose of the original promoters and places the ultimate construction beyond question of doubt.

It is interesting also to note that during the recent financial depression which has extended over a period of months, that men of large business affairs, believing in the future of the parkway, have interested themselves in a substantial manner by subscribing to its securities.

The offices of the company during the entire period have been maintained at the first address, No. 527 Fifth avenue, as well as the engineering office in Mineola, which has been a hive of industry from early morning until late at night for the past twelve months. A most effective engineering force, under the direction of W. G. Williams, the chief engineer of the company, has been formed, and has been constantly on the work of surveys, clearing side and center lines, preparing plans and specifications for numerous highway and railroad crossings, making careful study of the contours of the country.

The place where the inaugural will occur may be reached by automobile from Jamaica, by any one of the following routes: Jericho turnpike, direct to Jericho south through Hicksville to Central Park; Jericho turnpike to Queens, thence by the Queens-Hempstead turnpike through Hempstead to Central Park; Old Country road from Mineola to Hicksville, and south on Broadway to Central Park; Merrick road from Jamaica to Massapequa, turn north at Oyster Bay road to Central Park, other but indirect routes also being available.

NEW YORK'S ORPHANS NOT TO BE FORGOTTEN.

Failing an organization to take up the good work that was so ably carried out by the New York Motor Club, with Samuel A. Miles as chairman on two occasions, in treating the orphans of Manhattan Borough to an automobile ride to Coney Island, a number of public-spirited tradesmen recently got together and determined not to let the event lapse for want of proper support. A meeting was held in the Thoroughfare building, and the owners of the latter donated the use of an office as headquarters. R. G. Howell was appointed chairman of the car and parade committee, and when seen was enthusiastic regarding the prospects for a record-breaking orphans' day celebration this year. The date has been set for June 9, and as soon as an announcement to this effect was made in the press, offers of cars began to come in without solicitation, contrary to the experience of former years. In fact, the prompt voluntary offer of so many cars leads the committee to believe that it will be able to carry every child in the institutions of New York City and Westchester.

YARMOUTH SLIDES BACK TO DARK AGES.

YARMOUTH, N. S., May 23.—Following the example set by other municipalities and counties of the Province, Yarmouth has taken advantage of the opportunity presented by the recently enacted amendment to the motor vehicle law, to pass an ordinance forbidding the running of automobiles on the city streets from midnight on Friday to the same hour on Saturday of each week. The penalties are \$20 for the first offense, \$30 for the second, and \$50 for the third.

AUTOS USED DURING CLEVELAND STRIKE.

CLEVELAND, May 26.—The street car strike in this city has given a wonderful impetus to the automobile trade, but it has done more than that, for it has shown conclusively that in an emergency of this kind the auto is the one and only thing which can render valuable assistance. Ever since the strike was declared, the city has had a large number of cars in its service day and night, taking squads of police from one district to another. Officers are kept in waiting at the various precincts for riot calls, and the cars carrying them may be seen speeding across the city at almost any hour of the day or night. The police are free to admit that they would have a hard time coping with the riotous element but for the quick transportation afforded by the cars. The newspaper men have also availed themselves of this feature of modern life, and all four dailies now have three or four cars in service every day.

DUTY UPON AUTOS REPAIRED ABROAD.

WASHINGTON, D. C., May 23.—The Treasury department is advised that an appeal has been taken from the decision of the United States circuit court for the southern district of New York in the Case of United States vs. W. R. Grace & Co., involving the classification of an automobile repaired abroad. In view of this the Collector of Customs at New York has been instructed to continue to assess duty upon automobiles which have been repaired abroad, pending the final decision of the matter, which may not be made public for quite some time to come.

WHAT IS GOING ON AMONG THE CLUBS

PRES. EDWARDS REPORTS ON LONG ISLAND CLUB.

BROOKLYN, N. Y., May 25.—In making his report for the first half of the club year, ending June 1, President Charles Jerome Edwards, of the Long Island Automobile Club, congratulates its members and officers on its substantial growth and increase in influence during that period. He calls attention to the fact that the Long Island club is the only organization in New York City that is a member of the New York State Automobile Association and of the American Automobile Association, and that as such its scope of influence and advantage is very great, and its opportunity for serving its members is correspondingly increased. The club's finances are said to be in excellent condition, the second mortgage bonds having been all retired, while the first mortgage has been reduced by 15 per cent. during the year and a sinking fund created to pay off the balance.

According to the report, the membership has now reached a total of 472. The numerous activities taken in hand by the club are mentioned, among these being the fact that the contest committee of the club has in charge the straightaway time trials to be held on Hillside avenue, Jamaica, June 5. The Legislation committee, consisting of Messrs. Richardson, Webb, Cluff and Field, ably supported the Uniform Registration bill, introduced in Congress by Representative Cocks of Nassau county, and also did a great deal of work in forwarding the interests of the uniform automobile law, following the lines of the Connecticut law, which is generally recognized as fair and reasonable legislation. "It is unfortunate that this bill failed of passage during the last few days of the session," says President Edwards in the course of his report, "because, it is said, of the interference of some Manhattan automobilists, whose appearance was entirely unauthorized."

The Good Roads committee, consisting of A. R. Pardington, chairman, L. H. Allen and C. Litchfield, reports that the Highway bill which passed the Legislature shortly before adjournment, will create for Long Island a trunk line system of highways; one on the north side, reaching from the Nassau county line via Smithtown Branch and Port Jefferson to Riverhead, and one along the south shore, following in the main the Merrick road and its extension eastward. There will also be a link connecting the north and south roads, south from Riverhead. Among the other activities of the club are those of the Runs and Tours committee, consisting of Messrs. Lefferts, Alderman and Hunt, which is preparing an attractive program, and the Country House committee, which has charge of the recently acquired country house, at Bayshore, Long Island.

HELLER NAMES N. J. A. AND M. CLUB COMMITTEES.

NEWARK, N. J., May 26.—President Paul E. Heller has named the New Jersey Automobile and Motor Club's committees for the ensuing year. They and their chairmen are: Legal, William F. Kimber; house, Charles W. Baker; legislative, W. C. Crosby; membership, Frederick A. Crosselmire; race, William C. Shanley; auditing, John K. Gore; good roads, Joseph H. Wood.

The club now has about 900 members, and as applications are being received at the rate of five a day, Secretary LeMassena is confident that the membership roll will pass the thousand mark in the near future, probably during the month of June. Its greatly increased membership will be put to effective use by the officers of the club in waging their fight at the next legislature for more reasonable motor vehicle laws. Plans for this campaign are already being laid. The board of trustees of the club have appointed Dr. James R. English, Dr. Frank B. Meeker and Frederick A. Crosselmire a committee to arrange for an orphans' day outing which the club has decided to hold some time in June or July. It is also planned to hold an endurance contest in the fall, to be open to members only.

THOUSAND MILES FOR CHICAGO MOTOR RUN.

CHICAGO, May 25.—Delayed by the hill climb in the preparation of rules for its four-day reliability run next month, the Chicago Motor Club was unable to announce the regulations until to-day, when the technical committee completed its work. The report shows a revision of the plans in that, instead of asking the cars to make a triple century a day, the distance is shorn to 250 miles per diem, making a total of 1,000 miles instead of 1,200. There has been a segregation of the touring cars and the roadsters, and, while they will follow the same routes, they will be competing for a different set of prizes. There are four classes in each division and each class has a different schedule.

In the roadster class, A will be for cars listing under \$1,000, and the schedule calls for 16 miles per hour; class B is for cars from \$1,000 to \$1,999, and will do 18 miles per hour; class C, from \$2,000 to \$2,499, and class D, for cars from \$2,500 up, will do 20 miles per hour.

In the touring car division, class F is for cars from \$1,000 to \$1,999, and class F from \$2,000 to \$2,499, and their schedule will be 18 miles an hour. Classes G and H, the first from \$2,500 to \$3,999, and the other from \$4,000 up, will maintain a pace of 20 miles an hour.

Prizes will consist of trophies and medals. In addition there will be a trophy, which has been given by the Standard Oil Company, which goes to the car with the least gasoline consumption, figured on a ton mileage basis.

DOCTORS FORM AN AUTO ASSOCIATION.

ORANGE, N. J., May 25.—The Physicians' Automobile Association of the Oranges has just been formed here with a charter membership of 40 of the local healers who are advocates of the automobile. The officers of the newly organized association are: President, Dr. Edgar C. Siebert; vice-president, Dr. Palmer A. Potter; secretary, Dr. Stephen G. Lee; treasurer, Dr. Arthur W. Bingham. The board of governors is composed of the following: Dr. Thomas W. Harvey, Dr. Mefford Runyon and Dr. Richard D. Freeman. Quarters have been taken in the rooms of the William Pierson Medical Library Association in the Orange Free Library Building.

OHIO AUTOISTS TO TOUR TO BUFFALO.

CINCINNATI, May 25.—C. Gordon Neff, of the Automobile Club of Cincinnati, and vice-president of the Ohio State Automobile Association of the American Automobile Association, is setting an excellent example to his brother autoists in other States, by organizing a run of autoists from all parts of the "Buckeye" State to Niagara Falls and Buffalo, the dates being scheduled to reach the latter place in time to take part in the big legislative and good roads convention that will be held July 6-8. Mr. Neff is a member of the Good Roads committee of the three A.'s and is doing excellent work.

MARYLANDERS AFTER GOOD ROADS.

BALTIMORE, MD., May 23.—Members of the Automobile Club of Maryland, owners, dealers, manufacturers and agents in Baltimore and Howard, Frederick, Washington, Allegany and Garrett counties, which will be held at Hagerstown early in June for the purpose of inducing the State Highway Commission to lend its aid in a movement for one main artery of improved highways from Baltimore City, through Frederick, Hagerstown and Cumberland, to Grantsville, Garrett county. United States Senators John Walter Smith and Isidor Rayner, Congressman George A. Pearre, members of the legislature, the State road engineer, county road engineers, directors and commissioners and members of the press throughout the State have also received invitations

to attend the gathering. The State Highway Commission and Archer B. Hulbert, author of many articles on improved highways, have also been asked to attend. The plan in view is to utilize the old Baltimore and Cumberland turnpike and the old National road for this proposed vast improvement. The guests will go to Cumberland the day following the meeting, where a banquet and reception will be held.

The Good Roads Commission, headed by Governor Crothers, has inaugurated plans for improved highways in Maryland. The first step was an inspection visit the past week to southern Maryland. Similar trips will be made to the Eastern Shore the coming week and to the Western Shore beginning June 3.

WASHINGTONIANS WILL TOUR THREE STATES.

WASHINGTON, D. C., May 23.—Members of the Automobile Club of Washington are looking forward with interest to the club's initial tour of the year, which will take place May 29-31 and which will take the tourists into three different States—Maryland, West Virginia and Pennsylvania. The tourists will start at noon on May 29 and proceed leisurely to Harper's Ferry, W. Va., via Frederick. The second day's run will be from Harper's Ferry to Gettysburg, via Winchester, Martinsburg, Hagerstown and Waynesboro. Sunday will be spent in touring the Gettysburg battlefield and making the trip homeward. The route selected for this tour is through a country rich in historical interest, while the roads and scenery are the best to be found in this section of the country.

President Caverly and John K. Heyl and W. D. West were appointed delegates to the A. A. A. convention in Buffalo, July 7-9. President Caverly will bring to the attention of the convention the project of constructing a Lincoln memorial boulevard from Washington to Gettysburg. As the 100th anniversary of Lincoln's birth will occur next year, it is suggested that the proposed boulevard would be a fitting tribute to the martyred president. It is believed automobilists throughout the country will indorse the project.

ONE MORE CLUB FOR THE OLD DOMINION.

SUFFOLK, VA., May 26.—In response to a call signed by twenty-five of the forty owners of automobiles in the city, a meeting has been held resulting in the formation of the Suffolk Automobile Association, and the election of the following officers: President, C. A. Sharpe; first vice-president, William N. McAnge; second vice-president, Benjamin L. Saunders; secretary-treasurer, R. L. Gaskins. Application for membership in the State association of the A. A. A. was directed to be made by the secretary. Chief among the objects of the club as embodied in the call for the meeting were to secure speed laws, giving due protection to the public while not unreasonably hampering the use of motor cars for pleasure driving and also to promote highway improvement.

NEW HAVEN AUTOISTS ORGANIZE TO DO GOOD.

NEW HAVEN, CONN., May 25.—After many desultory efforts covering several years New Haven at last has an automobile club which bids fair to being a success. A club has been organized with thirty-two charter members, with these officers: President, Thomas G. Bennett; vice-president, Jacob P. Goodhart; secretary, Amos F. Barnes; treasurer, William H. Douglas. There will be five committees, membership, contest, rights and privileges, good roads, and sign post, each composed of three active members. Great care was exercised in drafting the constitution and by-laws, and these differ in several respects from those of most other clubs. Two clauses read as follows:

"The committee on rights and privileges shall have charge of all alleged infringements of the legal rights of the club or its members, and shall advocate and endeavor to obtain proper privileges for and protection of the members in the use of the highways and parkways.

"It shall be the duty of the committee to receive complaints from any person in regard to reckless driving or violation of any automobile statute or ordinance, or of the rules of the road, by any autoist, and immediately upon the receipt of such complaints

the committee shall send a warning to the person or persons complained of, in the name of the club. If a second complaint is received a second warning shall be sent, notifying the party complained of that unless he complies with the law the club will assist in his prosecution. If such person after the second warning shall continue to violate the laws of the State or the ordinances of any city, town or borough this committee shall bring the matter to the attention of the proper authorities and assist in the prosecution of such person in such manner as it shall deem best."

WILLIMANTIC CLUB COMPLETES ORGANIZATION.

WILLIMANTIC, CONN., May 25.—An enthusiastic meeting of the recently formed Willimantic Automobile Club was held here last week, at which the organization of the club was completed. Dr. John Weldon, who was elected president at the last meeting, was in the chair. The by-laws drafted by the board of governors were submitted and approved, and were subscribed to by 30 charter members. As there are only about 50 resident automobile owners in this section, the club has made a very good start. A letter was read from Guy K. Dustin, of the Connecticut State Automobile Association, asking the local club to elect a director in the State body. De Witt C. Hill was chosen for the place, and will attend the next meeting of the directors of the State association, to be held at the Atlantic House, Bridgeport, May 30. The matter of providing automobiles for the members of the local G. A. R. post on Decoration Day was also taken up, and the members of the club agreed to use their cars for this purpose.

BUFFALO CLUB WINS CASE AGAINST CITY.

BUFFALO, May 25.—A decision in favor of the Automobile Club of Buffalo in the action brought against Secretary Dai H. Lewis to test the validity of the municipal tax of \$5 a year, has just been handed down by the Court of Appeals. The case was tried in the first instance before Judge Hodson, of the Municipal Court, who ruled against the city on the ground that the municipality had no legal right to impose an additional tax on the use of an automobile. The opinion of the Court of Appeals reads, in part, as follows:

"When the occupation or use of a public street involves danger in some degree to the public, a license may operate as a partial restraint upon such use of the public streets. The purpose of the ordinance in question to restrain the use of motor vehicles in the public streets of Buffalo is so obvious that very little weight can be given to the fact that it is called a tax instead of a license. We think that the ordinance is a plain attempt to avoid the provisions of the motor vehicle law, and that it should not be upheld."

CLUBS RAPIDLY FORMING IN NUTMEG STATE.

HARTFORD, CONN., May 25.—Rockville, a manufacturing town about 15 miles east of this city, is the latest to add an automobile club to the State's rapidly growing list of organizations. A number of progressive autoists got together there recently and formed the Automobile Club of Rockville, several of the members already being affiliated with the Automobile Club of Hartford. The newly formed organization has already been admitted to the Connecticut State Automobile Association, and, through the latter, to the American Automobile Association, and has signaled its existence by preparing to hold a hill-climb on New England Hill in connection with the Old Home Week celebration—a typical Down East institution.

CLEVELAND CLUB'S RUN TO CAMBRIDGE SPRINGS.

CLEVELAND, May 26.—Starting the morning of Decoration Day, May 30, and continuing for three days, the annual run of the Cleveland Automobile Club to Cambridge Springs promises to be the best event of its kind ever held by the local club.

The run to Cambridge Springs is an annual event, but never before have such preparations been made to insure its success. Among other things which will be given for the benefit of the tourists will be an amateur minstrel show and dance. Non-members of the club may also go upon this run, first securing a card through a member. The distance to the Springs is approximately 110 miles and the roads are in very fair condition.

NINETEEN PERFECT SCORES IN INDIANA SEALED-BONNET RUN

INDIANAPOLIS, IND., May 21.—The first reliability run or sealed-bonnet contest ever held in Indiana was run May 20 by members of the Indianapolis Automobile Trade Association, covering a course of approximately 150 miles through Central Indiana. Out of thirty-seven starters, nineteen finished with perfect scores. Ten out of the fifteen cars in Class A, which was for machines listing over \$2,500, were perfect; five out of the six in Class B, \$1,500-\$2,500, went clean, and four out of sixteen in Class C, under \$1,500, escaped penalty.

Those with perfect scores were as follows: Marmon, three; National, two; Premier, two; Maxwell, two; White, Haynes, Bulck, Rambler, Rapid, Lambert, Marlon, Mitchell, Overland, Reo, one each.

Some of the worst hills in Indiana were encountered, and there were long stretches of dirt roads, and in several places the heavier cars sunk almost hub deep in them. The day, however, was perfect for such a contest. On Monday and Tuesday rains eliminated the dust, and on Wednesday the highways were just damp enough to keep dust from flying. There was just a trace of wind, and the sun shone brightly throughout the run. Tuesday afternoon the contesting cars were turned over to the technical committee for examination and sealing, and they remained parked on the Meridian street side of University Park all night.

Promptly at 7 o'clock, W. C. Marmon, driving a Marmon, crossed the tape as the first to start on the long run. Then the cars began leaving one minute apart, with ten minutes between classes, and every car left on time to the second. Leaving Indianapolis, the cars went north through Crow's Nest to the

road leading to Westfield, thence to Noblesville and Anderson, the latter city being the first checking station. From there the route led east to Muncie, thence to Newcastle, and from there to Indianapolis, through Dunreith, Knightstown and Greenfield, the last 40 miles being over the National road. At Anderson, while the cars were waiting to check in, the Buckeye Manufacturing Company, which makes the Lambert, gave the occupants of each car box lunches, and at Newcastle the Maxwell-Briscoe Motor Company provided roses.

The technical committee drew the line very closely, almost splitting hairs, in the final examination of the cars, yet despite this fact there was not a single protest from its decisions. A penalty of 25 points was incurred for each broken seal, with a penalty of two points for each minute spent in working on the car. Additional penalties were incurred for loose and broken parts found at the conclusion of the run. Without doubt the most interesting feature of the run was the perfect score made by a twelve-passenger Rapid 'bus, entered by Frank Grogan, an eighteen-year-old boy.

The rules and technical committee was composed of W. G. Wall, of the National Motor Vehicle Company; Howard Marmon, of the Nordyke & Marmon Company, and George A. Weideley, of the Premier Motor Manufacturing Company, chairman. The contest committee was: Frank Staley, of the H. T. Hearsey Vehicle Company; A. E. Vinton, of the G & J Tire Company; Frank Moore, of the Fisher Auto Company; P. D. Stubbs, of the Overland Automobile Company; Paul Smith, of the Indianapolis Motor Car Company, and George Weideley.

ALBANYITES OF NEW YORK STATE HAVE A SUCCESSFUL CLIMB

ALBANY, N. Y., May 23.—Though hill-climbing events have not been included in its catalogue of activities in the past, the Albany Automobile Club's first contest, which was held on Menands hill to-day, proved conclusively that the successful management of such an affair was something easily accomplished by the organization. The course had been affected somewhat by Friday's rain, but the treatment of oil it received subsequently put it in fine condition for the climb. A hill-climb is a novelty in this district and an immense crowd was attracted, lining the entire course from start to finish.

The free-for-all events and the special for six-cylinder cars provided the major portion of the excitement of the day. The former brought forth two double winners, C. S. Ransom's Stevens-Duryea "six" making the best time of the day, :53 1-5,

in the free-for-all touring cars, while he brought the same car home a winner in the six-cylinder event in :54 4-5 seconds.

In the free-for-all runabouts, Chauncey D. Hakes' Apperson "Jackrabbit" made the half-mile grade in :58 1-5, and in the event for runabouts listing above \$3,000 repeated its performance by winning in exactly the same time. A Knox was second and a Locomobile third.

In addition to the Stevens-Duryea "six" taking first in the touring car and six-cylinder events, cars of the same make also took first and second places in each, while in the latter a Stevens-Duryea was also third, a Pierce Arrow coming in fourth. There were four other events for gasoline touring cars listing at different prices, and five events for runabouts, the prizes offered in each case consisting of gold cups.

THOMAS WALLOWS STEADILY THROUGH SIBERIAN SLOUGHS

ACCORDING to advices received by the *New York Times*, from Nikolsk, Siberia, the Thomas crew has been struggling against odds that make the mud of the Iowa prairies and the snows of the Rockies mere child's play by comparison. Schuster's account of their struggles thus far, states that they only saw the sun once from Friday to Monday, and shortly after its reappearance were again overtaken by a violent thunder storm which converted the whole stretch of lowland into a miniature sea, so that it was necessary for the crew to wade ahead in order to pilot the driver. They finally landed in the middle of a stream, from which it was necessary to extricate the car with the tackle and the route was retraced several miles to a small village where the night was spent. It was learned there that the Protos had been making good time over the railroad ties while the Thomas crew was struggling with the mud and had gained a good lead, and the Americans will henceforth abandon the road for the right of way.

The start from Vladivostok was delayed from Wednesday to Friday owing to a last desperate attempt of St. Chaffray of the De Dion crew to continue in the race. The French car having been formally withdrawn, St. Chaffray determined to get a place on the Thomas and to insure this end quietly cornered the avail-

able gasoline supply. He then asked for an interview with the American crew and offered his rights to the precious fluid for a place on the Thomas, which was indignantly refused by Schuster who would not consider the Frenchman's company on any conditions, even if they had to wait indefinitely. Lieutenant Koeppen and the Protos crew declined to take advantage of the American's predicament and waited until they could start together. American residents and Russian officials emptied the tanks of their launches while others contributed toward a sufficient supply to enable the Americans to get away after a delay of but two days.

The Russian officials have aided the contestants in every way, the Governor-General of the province sending his Adjutant along as a guide for the first stretch of 100 miles, while Schuster has been provided with papers instructing the commandants of all the Cossack posts along the route to aid the drivers in every way. The military authorities have also furnished maps and information concerning the roads and supply stations along the route. Captain Hansen, who is the Russian interpreter for the party, has found no difficulty in making arrangements. It required two days of the hardest kind of work to make 94 miles, during which the Thomas pulled the Protos out of the mud.

ONE ATTACK UPON NEW JERSEY LAW'S CONSTITUTIONALITY

TRENTON, N. J., May 25.—Not because the program had not been arranged with due attention to the details, but because the chief actor had not lived up to his part by staying arrested for violating the Jersey law, Judge Lanning, sitting in the United States District Court, dismissed the application of R. H. Johnston for a writ of *habeas corpus* to-day. In accordance with a plan outlined by X. P. Huddy, of counsel to the White Company, Mr. Johnston drove a White steamer into Trenton on Friday last without the formality of having procured a Jersey license. The Trenton police department had been notified well in advance, otherwise Mr. Johnston might have found it difficult to be arrested, but no less a person than police captain John J. Cleary took him into custody. There was the usual hearing at which the prisoner pleaded not guilty, and the magistrate fixed Friday, May 29, to hear the complaint. In the meantime Johnston followed the even tenor of his way by promptly departing for another jurisdiction, while his counsel drew up an application for a writ of *habeas corpus* to get him out of the supposed durance vile of a Jersey prison. The idea was to bring the matter before the Federal courts on the ground that the prisoner was engaged in interstate commerce, thus avoiding the long preliminary delay of dragging it through the State courts, but Judge Lanning thought the scheme was too transparent. There was no prisoner. Hence, the court had no jurisdiction to grant a writ for his release.

Mr. Johnston immediately became a prisoner in reality upon

the dismissal of the application for the writ, and gave his machine as security for his appearance before Police Judge Harris next

H. R. Johnston Undergoing Arrest at Trenton, N. J.

Friday. Following the hearing of the case before the police magistrate, it is the intention of counsel to bring the case before the New Jersey Supreme Court on a writ of *certiorari*.

AUTO TRAPS NUMEROUS IN NEW JERSEY THESE DAYS

UP to this time there have been few auto-traps in that part of New Jersey around Englewood; but (emulating the example of various other places), two or three of the cities and towns in that district have started in to get their share of the autoist's spare change.

A week ago last Sunday the little town of Tenaflly had its "trap," and among the various arrests was the Mayor of Englewood, who left a matter of \$8 or so with the Tenaflly authorities. On the following Sunday Englewood had its own trap, and got back several times what its mayor was out a week before. This latter trap was located on Engle street,

between Palisade and Hamilton avenues, near the business center, where there is a more or less steady procession of autoists, especially Sunday afternoons.

We are informed upon reliable authority that within the past six years there have been only two accidents in Englewood—one of them due to carelessness on the part of the autoist, and the other to a deaf-and-dumb person, after which occurrence the autoist was exonerated. So far as we are able to learn, there has never been an accident in Tenaflly, and it is difficult to see any reason for the existence of traps in either one of these places.

A. L. A. M. ADOPTS FURTHER STANDARDS.

In furtherance of its policy of adopting standard forms of construction wherever these may be consistently used by all the members of the association in the construction of their cars, the Association of Licensed Automobile Manufacturers has had its

Assembly A. L. A. M. Adjustable Yoke and Eye Rod End.

Mechanical Branch draw up specifications for standard forms of yoke and eye rod ends. This is the third formal set of standards adopted by the association, the first being that screws, nuts and bolts, while the second was the A. L. A. M. standard spark

Assembly and Details A. L. A. M. Fixed Yoke and Eye Rod End.

plug. The accompanying drawings show the details of the proposed standards for yoke and eye rod ends in the 1/2-inch size. The sizes given in the circular announcing the standard are 1/4, 5-16, 3/8, 7-16 and 1/2-inch. Copies of the circular in question giving detailed drawings of each one of the sizes mentioned, may be had by car or parts manufacturers on application.

FURTHER PROSECUTIONS IN LAMP LITIGATION.

Following up the injunction against the Saxon Lamp Company, forbidding the latter to manufacture or sell colorable imitations of the Rushmore designs, the Rushmore Dynamo Works, Plainfield, N. J., has further prosecuted this concern for failing to obey the court's order by bringing out a lamp differing but slightly in detail from the one on which the injunction was originally obtained. After hearing the case, Judge Ray decided that the defendant had wilfully and knowingly violated the injunction in question and adjudged him in contempt, imposing a fine of \$500.

ENGINEERS MEET AT CLEVELAND PLANTS.

CLEVELAND, May 23.—As a result of the new plan recently adopted by the Association of Licensed Automobile Manufacturers to have its technical men be given every opportunity to visit the plants of the different makers in the association, the Mechanical Branch met in this city yesterday.

The morning session was devoted to a discussion of the report on the recent checking tests made on the dynamometer of the Automobile Club of America in New York, a fortnight ago. Henry Souther, the recently appointed chairman of the technical committee of the Automobile Club of America, was present and expressed the gratification of the club as to the action of the Licensed Association in testing the dynamometer. Following the reading and discussion of the report, a paper on the two-cycle motor was read by E. W. Roberts, and this was in turn followed by a paper on combination valves for four-cycle motors, by C. E. Thompson, of the Electric Welding Products Company. The valves referred to are those in which a nickel-steel head is welded on to a carbon-steel stem. The fact that the metal may be injured by the high heat necessary for welding was brought out, and to overcome this it is the practice of the makers in question to resort to heat treatment after welding. Both papers were followed by discussions of the subjects in question.

In the afternoon, the engineers visited the plants of the Peerless Motor Car Company, the F. B. Stearns Company and the Winton Motor Carriage Company. Those in attendance were: A. L. Riker, chairman, and A. C. Schulz, Locomobile Company; George W. Dunham and C. J. Kryzanowsky, Olds Motor Works; Russell Huff, Packard Motor Car Company; E. H. Parkhurst and W. H. Staring, Peerless Motor Car Company; David Fergusson, George N. Pierce Company; J. G. Sterling, F. B. Stearns Company; John G. Utz, E. R. Thomas Detroit Company; Thomas Henderson, H. B. Anderson, C. D. Smith and Charles W. Mears, Winton Motor Carriage Company; E. P. Chalfant, assistant general manager of the Licensed Association; Henry Souther, consulting engineer, and C. F. Clarkson, secretary of the Mechanical Branch.

FRANKLIN SUCCEEDS WITH ALCOHOL MOTOR.

Although their experiments with alcohol as a motor fuel were productive of successful results at first, the engineers of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., persevered and their efforts have now been attended with unlooked-for results. It will be recalled that only recently the Franklin engineers announced that their findings did not warrant the belief that there was any immediate future for the alcohol motor, and it was pointed out that even if gasoline and alcohol could be purchased at the same price the advantage in favor of the former would preponderate greatly. Since then, however, they have succeeded in perfecting an alcohol motor which shows as high a degree of efficiency as one using gasoline, and that without the expedient of employing a very high compression as has usually been found necessary. It also has the further advantage of being equally economical in the use of fuel, a consumption of as low as 1.05 pounds per brake horsepower hour having been achieved, while there are no detrimental effects on the motor itself from using this fuel. Were both fuels on a par, it would be equally economical to use either alcohol or gasoline in this motor, and this means a tremendous step in advance, particularly for commercial vehicle use, as the cost of fuel is an item of great importance in this connection.

The announcement to this effect has aroused a great deal of interest, particularly from distillers of denatured alcohol, the United States Industrial Alcohol Company immediately having undertaken an investigation of the Franklin motor. Apart from the fact that the new motor, which has been proven perfectly practical for automobile use, does not use a compression exceeding 90 pounds to the square inch, nothing concerning its technical details is forthcoming.

NOT SATISFIED WITH WHAT IS AVAILABLE.

CHICAGO, May 25.—Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, is expected in Chicago shortly to discuss with the two local clubs a suitable location for the show which the independents may hold in Chicago next Winter. Manager Reeves has written the Chicago Automobile Club regarding the two locations offered by the club, declaring that the Dexter Park pavilion at the stockyards does not come up to the mark so far as location is concerned, although it has more than enough floor space.

The other building, the Seventh regiment armory, now in course of construction at Wentworth avenue and Thirty-third street, is admirably situated, but the floor space is insufficient. It is cut up into two floors, and the first floor would not begin to accommodate the manufacturers of cars. In the Dexter Park pavilion are held the annual stock shows and the affair draws out great crowds. Next winter there will be a spur of the elevated which will make it conveniently accessible.

TIREMAKERS CONSIDER PRICE-CUTTING.

CLEVELAND, May 25.—That the prices of automobile tires may be changed next year is the very probable outcome of the meeting of the tire committee of the Motor and Accessory Manufacturers, held in this city May 21. While no drastic action with immediate bearing upon the future was taken, the consensus of opinion is that a reduction in prices will be the final result. The meeting in this city was the result of continued price-cutting all over the United States for the past few months, and the tire committee decided to take some action upon the matter. The Cleveland branches of the tire companies have been powerless to stop the war, and appealed to the factories for help.

Another factor in the situation has been the club proposition, which the tire and accessory makers desire to have regulated before its further spreading. Club members securing inside prices is seriously cutting into the business of the accessory dealers and is generally considered detrimental to the trade, which fears that it may even extend to the buying of cars.

Within the next few weeks a letter will be sent to every automobile and tire dealer in the United States, laying the status of the matter before each one individually, and requesting an expression of opinion as to whether or not the price to the consumer had not better be changed. The tire men figure that if the price to the consumer is reduced somewhat, there will be less incentive to buy from the price cutters, and that they in turn cannot afford to offer goods at as low a figure as has been the case in the past. Another meeting of the tire committee will be called for July 25, and definite and lasting action will then be taken. At the meeting here practically every tire manufacturer in the United States was represented with the exception of the Michelin Company.

BOSTON REPORTS TRADE HEALTHILY BOOMING.

BOSTON, May 18.—The local automobile trade is experiencing a marked boom, and since the first of the month business has been better than during any similar period this season. All through the automobile districts the dealers are reporting a good business, and some of them are running short on prospective deliveries of certain models. The approach of Summer and good touring weather is given the credit for the expansion of business and the trade feels very well satisfied with the conditions and the prospects, as most of the sales now being made are for immediate delivery. Alvan T. Fuller, who handles the Packard, last week made his last delivery of the 1908 model of this car, and several other dealers, notably J. W. Bowman of the Stevens-Duryea, have oversold allotments of some models.

The excellent condition in the trade is reflected at the office of the Massachusetts Highway Commission where since the first of the month cars have been registered at the rate of 90 a day, the total registered since the first of the year being about 12,000.

CHAIRMAN THOMPSON APPOINTS MEMBERS.

Jefferson deMont Thompson, chairman of the A. A. A. Racing Board, has announced the appointment of Robert Graves and Harry T. Clinton as members. Mr. Graves is a pioneer American autoist, having entered cars in two of the Vanderbilt Cup races. Mr. Clinton is manager of the publicity department of the Association of Licensed Automobile Manufacturers.

QUAKER CHAUFFEURS' PROGRAM.

PHILADELPHIA, May 25.—To increase interest in its organization and to attract the better class of men, the Philadelphia Mechanical Chauffeurs' Association will, beginning Friday evening next, May 29, inaugurate a series of lectures upon mechanical subjects relating specially to the manufacture and operation of automobiles. The subject for the first lecture has been announced as "Magnetos," and will be handled by a representative of the Bosch Magneto Company, of New York.

REAL ESTATE MEN START AUTO CAMPAIGN.

PATERSON, N. J., May 25.—Realizing the value of the automobile as a means of showing property in outlying districts, the New York-New Jersey Real Estate Exchange has organized a campaign of personally conducted automobile trips to those sections of New Jersey in which development operations are now in progress. Under the guidance of Otto Kempner, president of the Exchange, the first of these trips was held last Saturday, a large party of New Yorkers interested in Jersey realty being carried out to this city, where they were met by a score of touring cars in charge of a committee consisting of E. H. Lambert, Louis A. Piaget, Henry Snyder and Judge Kerr. About 100 of the visitors were tendered a luncheon at the Hamilton Club, where the advantages of Paterson and its suburbs were extolled by Senator John Hinchcliffe, Dr. Shaw, Judge Van Cleef and others, following which the decorated cars paraded through the streets. Castle Lambert and its art gallery were inspected, the visitors were received by Mayor McBride at the city hall, and were later entertained at the North Jersey Country Club.

PHILADELPHIANS TO HAVE AUTOCABS.

PHILADELPHIA, May 25.—"Gasoline Row" was agog early last week over the arrival here of ten Thomas taxicabs. The excitement was due not so much to the arrival of the vehicles—for that had been expected—but that they were taken to the big new garage of the Bergdoll Motor Car Company, at Broad and Wood streets. Later it developed that R. A. Park, who, rumor has it, will manage the Thomas cab system here, had set up his desk in the Bergdoll office, and it was bruited along "the row" that those who had been storing their cars at the Bergdoll plant had been given notice to move at an early date. All of which is circumstantial evidence that the young millionaire brewer and crack driver at the head of the company is preparing for a comprehensive campaign to exploit the Thomas taxicab here. Although direct questioning both at the local Thomas agency and at the Bergdoll offices failed to elicit any definite information as to when the service will be inaugurated, it was stated in a general way that "plans were being perfected for an early start."

Further search for information led THE AUTOMOBILE man to establish motor cab service here developed the fact that the Quaker City Cab Company is contemplating adding such a Berliet cab service to its large horse-drawn outfit.

Further search for information led THE AUTOMOBILE man to the Bellevue-Stratford garage, where Manager Lewis gave out the information that within sixty days the Pennsylvania Taximeter Cab Company, recently incorporated in Camden with a capital of \$50,000, would have on the street at least 25 specially designed taxicabs of 24 horsepower and capable of carrying five passengers exclusive of the front seat. These vehicles are now being built at Chester, Pa., by the Hinckle-O'Brien-Lewis Co.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Up to the time of his death a few days ago, Henry A. Allen, of Shushan, N. Y., could doubtless lay claim to being the dean of amateur autoists. He was 93 years of age, but both drove and took care of his own car. He was as enthusiastic an autoist as many a man of a third of his years.

Canton O'Donnell, writing to a Denver friend from Dresden, Germany, says: "I saw an old two-cylinder Winton here yesterday; one of the '04 models. It looked good to me; just like a letter from home. Running just like the first one I ever saw, smooth as any two-cylinder ever made."

The Arkansas Valley Auto & Transit Company has been incorporated at Las Animas, Col., with a capital of \$25,000, to conduct a garage and general repair shop, and will also undertake the contract of transporting sailors to and from the new naval hospital at Fort Tyon. The new company is open for agencies of both cars and sundries.

Pirelli & Company, the Italian tire makers, who have their New York offices at 296 Broadway, are in a position to state authoritatively that the Zusta car will continue in the New York-Paris, despite all rumors to the contrary. The Zusta has been equipped with Pirelli tires throughout the race, and the makers are confident will bring them in to Paris among the leaders.

The P. & H. Tire Company, 1657 Broadway, New York, has just closed what is thought to be one of the biggest tire deals put through. It is a contract with Norvell, Shapleigh & Company, St. Louis, to take a minimum of 75 P. & H. tubes daily, their average now being 200 per day. The St. Louis house becomes the United States distributors, having the entire territory, except New York and New Jersey.

Coincident with the holding of the Long Island Subway celebration at Jamaica, the Jamaica Motor Car Company will open a new branch garage on Hillside avenue, near the corner of Flushing avenue. A large building constructed especially for the purpose is now nearing completion. It will also contain salesrooms for cars and sundries and complete lines of supplies.

Morton E. Converse, of Winchendon, Mass., the wealthy toy manufacturer, has just returned from a round trip to Washington, D. C., in his new Grout car. Mr. Converse took the car on this 1,200-mile trip right out of the factory and ran the entire distance both ways without having to make an involuntary stop. This is his second Grout and he is enthusiastic over the car's good points.

The Trojan Hydro-Pneumatic Wheel Company, Watervliet, N. Y., has just completed the installation of a set of their hydro-pneumatic springs to one of the 9,000-pound trucks being run in the service of R. H. Macy & Company, New York City. This is the first truck ever mounted on springs of this kind, and as the latter are the only ones of their class on the market the outcome will be looked forward to with considerable interest.

Announcement is made that there will be at least one, and probably two, of the new Hol-Tan cars in the coming A. A. A. Reliability tour this year. The factory in Massachusetts is making good progress on the series of cars now being turned out

and it is expected that cars will not only be on exhibition at the New York salesrooms very soon, but that the Hol-Tan Company will be in a position to make deliveries on orders.

Negotiations were successfully terminated last week for the exclusive use of the Elmore taxicab at the new terminal station in Washington, D. C., and this is but one of the cities in which the two-cycle cab turned out by the Elmore Manufacturing Company, Clyde, O., is rapidly making headway, as Chicago, New York and Boston are also operating Elmore cabs. Within a few weeks thirty of the Elmore taxis will be shipped to Washington.

As the result of the recent visit of two of the English directors, prominent in the affairs of the home company, the Spare Motor Wheel of America, Limited, has reorganized its selling forces. George S. Morrow, who has been located at the New York office, has been sent to take charge of the Chicago branch, and the headquarters of the company have been removed to attractive salesrooms on the ground floor of 236 Michigan avenue, a car with a Stepney wheel in use and a second on the running board being kept constantly ready for demonstrations. As copies of the Stepney spare wheel have already appeared, the company has begun actions against the infringers.

To demonstrate that the present day automobile is built to withstand any kind of usage, no matter how hard, and to prove that the American car can run indefinitely over all kinds of roads, the Premier Motor Manufacturing Company, makers of the Premier car, which has been the official pathfinder in laying out the Glidden Tour route, will start a Premier on Monday, June 1, making a century each day for 100 consecutive days. The car will be under observation by disinterested people. The run is unique and will prove valuable to motoring circles in general. The itinerary will be announced later. The car will not complete its endurance test until the first week of September.

"I find business quite as active as it was a year ago," said A. Atwater Kent, of the Atwater Kent Manufacturing Company, Philadelphia, Pa., in speaking of business conditions in the West. "Most of the larger factories are working full time and over time, to meet the sudden demand occasioned by the early spring, and those makers who have a practice of finishing their cars early are sold out, while others have found it necessary to put through special lots of cars for summer delivery. So far as I could see, the manufacturers who got scared and thought it necessary to curtail their product, are now sorry for it. Instead of cutting down our schedules, we increased them and are now thankful that we did so. We contemplate doubling our floor space in the near future."

In judging the value of tires for big cars, an important factor is the size and quality of the strip of rubber that, in the best makes, is interposed between the fabric, or envelope, of the outer casing and the tread; it is usually separated from the tread by one or two plies of fabric, called the "breaker." The pad of rubber thus intervening between the tread and envelope is called the "cushion," and its function is well described by E. H. Broadwell, of the Fisk Rubber Company, who says: "The cushion

is a sort of shock absorber and distributor, which prevents the blows from stones, ruts, and other obstacles, when hit by the tire, being borne by one or two threads, which would cause them to break and prepare the way, by cutting fellow threads, for a blow-out. In the Fisk heavy car type of tire, a pure rubber cushion of unprecedented size is used to distribute these shocks, so that the whole fabric shares in sustaining them.

NEW AGENCIES ESTABLISHED.

The Foss-Hughes Motor Car Company, which handles the Pierce-Arrow, Cadillac, and Baker electric cars in Philadelphia, has taken over the agency for the Pope-Hartford from the firm of Noblit & Fassett, which has gone out of business. The Matheson car, which was also handled in the Quaker City by the defunct firm, will for the present remain unrepresented there.

In order to be in a better position to take care of the New York trade, the Hartford Suspension Company, which recently removed its headquarters to 150 Bay street, Jersey City, N. J., has opened a branch office at 212 West Eighty-eighth street, near Broadway, New York City. It will be in charge of Ernest R. Waterman.

PERSONAL TRADE MENTION.

Roy H. Hagerling, formerly connected with the Central Pennsylvania Automobile Company, Harrisburg, Pa., is now identified with the Motor Car Company, Baltimore, Md., agents for the Thomas and Peerless.

F. J. Schafer, until recently with the Utica Motor Car Company, has gone into business for himself and has secured the agency for the Mitchell line. He has opened a garage and salesrooms at 221 Genesee street, Utica, N. Y.

Robert La Porte, for the past 16 years identified as a member of the selling force of the Hartford Rubber Works Company, has just left that concern to join the sales department of the H. H. Franklin Manufacturing Company, Syracuse, N. Y.

Frederick B. Hart, who has been acting as advertising manager for Thomas B. Jeffery & Company, Kenosha, Wis., has just severed his connection with that concern to accept a similar position with the Excelsior Supply Company, Chicago.

Stacy G. Carkhuff, secretary of the Firestone Tire & Rubber Company, Akron, O., has left for an extended business and pleasure trip to the Coast, where he will remain about a month. J. F. Singleton, advertising manager of the company, is now on the Pacific on a two months' leave of absence and the two will doubtless join forces. His place is being filled temporarily by W. G. Slater, of Cleveland.

George F. Kehew, for many years connected with the Pope Manufacturing Company, and up to recently representing the Wayne Automobile Company in New York, has just gone with the National Sales Corporation, 296 Broadway, New York, but will make his headquarters in Detroit, Mich. Mr. Kehew will devote his time particularly to ignition appliances, such as the Connecticut coils, timers, meter and quick detachable terminals; Buffalo mechanically controlled carbureters; Crown dry-cells; Soot-proof plugs and Pirelli cable, for all of which the National Sales Corporation acts as factory sales agents.

THE AUTOMOBILE

Driver Pollard Ready with His Winning Maxwell Crossing the Bridge at the Start.

BRIDGEPORT, CONN., May 30.—Practically every winner above the small car class took a whack at Tracy's record of 1:24 2-5 for Sport Hill, made last year in a Locomobile, and many substantial slices were taken out of it. Al. Poole, Tracy's former mechanic, lowered it to 1:17 flat, thus making a new low-water mark for the year, in his 50-horsepower Isotta, which accordingly was the winner of the Board of Trade Cup. Arthur Bell's Columbia made the next best time in the free-for-all by finishing in 1:19 4-5, while in the event preceding the free-for-all, which was the wind-up of the program, K. W. McNeil, in a 60-horsepower Stearns, took a few seconds off the record by winning in 1:20 3-5, while Harry Tuttle's 36-horsepower Stoddard-Dayton also came under last year's figures by making it in 1:22 3-5. This was event No. 8 on the well-filled entry list, and was for amateur drivers of gasoline cars, the trophy being the Craufurd cup.

Poole was the first to better Tracy's figures, and as he cut 4 2-5 seconds off them without knowing the hill and its winding turns, it was evident that he would do considerably better when it came to the free-for-all, as events later proved. This was in Event No. 7, in which the Isotta was entered as a stock car in the \$4,001-and-over class for the H. D. Miller cup, but upon examination by the technical committee the car was found to have no lamps or mud guards, and was accordingly protested as not being a stock car within the meaning of the regulations. Poole was permitted to make a time trial, however, doing the distance in 1:20. C. F. Alcott's 60-horsepower Stearns negotiated the hill in 1:23 flat, while K. Swain, driving another Stearns of the same power, made it in 1:25.

Unpropitious weather bade fair to spoil the elaborate prepara-

tions made by Chairman Ralph Sperry, of the executive committee of the Automobile Club of Bridgeport, and his numerous assistants, for the second annual climb of Sport Hill, as there was a heavy drizzle that continued up to within a few hours of the start, and that promised to convert the carefully oiled roadway of the hill into a most dangerous slide. But the clouds held off for several hours, and, although continually threatening a downpour, made as fine weather for such an event as could have been had to order. Nor did the overcast sky throw any damper on the popular interest in what is now regarded as Bridgeport's banner automobile event of the year, for the roads from the city were alive with people as early as 6 o'clock, although the climb was not scheduled to start until two hours later. Thousands poured out to line the course from top to bottom, but so well did Captain Hawes' men of the Coast

Artillery do their work that never for a moment was the road encumbered or the spectators allowed to depart from the side lines, for the khaki-clad men with their guns looked very business-like.

The same efficient management characterized the running of the entire event, so that everything was in clockwork order when Referee A. L. Riker gave the word for the start of the little Maxwell in Event No. 1, which was for gasoline cars listing at \$850 or less. People who have been accustomed to associate the diminutive "two-lunged" runabout with a rate of travel that

Isotta Winning Free-for-All and Bridgeport Cup.

Driver K. W. McNeill and His Stearns in the Trial in which that Car Captured the Craufurd Cup.

implied no excess of power for such a thing as overcoming a stiff hill, opened their eyes wide when Pollard dashed over the bridge just before the timer's box, going "all out" and sounding so like the business end of a big racer in the distance that it

Tuttle and His Two-Event Stoddard-Dayton Winner.

only lacked the familiar long drawn out "caar coming" to imagine one's self in attendance at one of the big classics of the year. The lay of the land lends itself admirably to the purpose of a hill-climbing contest, and the various committees in charge

Forbes and Overland Which Won the Second Event.

of the course had taken full advantage of it. The start was located on a level stretch, two or three hundred yards before reaching the elevated stand of the referee and timer, while intervening there was a curve and a sharp dip, ending at the bridge mentioned. This little grade gave the contestants excellent opportunity to get into their best stride in an unusually short distance, so that when they passed under the wire they were in excellent shape to tackle the stiff straightaway grade that stretched up in full view of the starter for fully an eighth of a mile or more.

The course had a natural bank to it on the turn that lay under the wire, and it was evident even to the inexperienced spectator that the driver who negotiated this first turn successfully gained fifths of a second in his getaway. Pollard evidently appreciated this, for he took the little Maxwell around the inside line of the curve as cleanly as if he had not been going more than ten miles an hour, and there was no trace of his passage on the road after he had gone by. Climbing Sport Hill in racing time is no child's play, for it is a big bump—as big and business-like an affair in the shape of a hill as is to be found anywhere in the East, within easy reach of a city, and it has a few singles and a double twist that compel respect and admiration from the man who knows what it is to take a car round them when it is a case of getting there quickly. But Pollard took the Maxwell round them in masterly fashion, and his time of 2:05 2-5 showed what was to be expected of the bigger contestants in the shape of record-breaking. There were originally three entries in this class, but the Buick, entered by H. J. Koehler, had been withdrawn, so the Ford runabout, No. 14, handled by J. G. Hyde, was the second to start. Hyde lost much of the advantage gained on the preliminary spurt by not taking the first curve right, a skid there robbing his attack on the first long grade of much of its ginger, which doubtless accounted for the Ford's poor time of 2:33. This stretch represented a good 10 per cent. grade, culminating in a short sharp rise, followed by a sharp turn to the left, and as the hill is unique in having no "back-dips," every single foot of it being up-grade, the advantage lost there could not be regained during the rest of the climb. With the exception of the dip preceding the start and the straightaway on the level at the top, that lent excitement to the finishes, there is not a foot where speed, once lost, can be regained.

An Overland and Reo were the sole entrants in Event No. 2, for cars listing from \$851 to \$1,250, which made it a second battle of two cylinders versus four, but in this case the result was reversed. T. C. Forbes, driving the 22-horsepower Overland, brought a cheer from the crowd when his time of 1:43 1-5 was announced, Lockwood's 16-horsepower, two-cylinder

Reo not having been able to do better than 2:13 3-5. Forbes had another go at the hill in Event No. 3, but did not do as well, the honors going to Ralph Burman's 30-horsepower Jackson in 1:39 4-5. The 28-horsepower P. & S. Skimabout looked so extremely business-like that great things were predicted for it, but its performance proved a disappointment, Manville not doing better than 1:51.

Harry Tuttle, driving a 30-horsepower Stoddard-Dayton, was the first to make an appreciable inroad into the figures by lowering the time to 1:29 flat in Event No. 5. W. Bogue's Knox was second in 1:32. Tuttle had a second try at the hill in Event No. 6, in which he was the sole starter, C. M. Murphy's Stevens-Duryea "Light Six" having been scratched, but he was several seconds slower. Excitement ran high when C. F. Alcott's 30-60 Stearns proved to be the first to cut under Tracy's record of last year by making the climb in 1:23, while a second Stearns, driven by K. Swain, made it in 1:25.

Then came the event that was expected to furnish an amount of interest, only second to the final free-for-all. The spectators were not disappointed, as K. W. McNeil's Stearns set the lowest official figures so far by making it in 1:20 3-5, while Tuttle bettered his previous efforts in the Stoddard-Dayton by coming home a good second in the contest for the Craufurd cup for amateur drivers, his time being 1:22 3-5. The free-for-all was naturally the crowing event of the day's sport, Poole making the climb in 1:17, the performance of Arthur Bell's Columbia in 1:19 4-5 furnishing considerable of a surprise. The summaries:

GASOLINE CARS, \$850 AND UNDER.				
No.	Car.	H.P.	Driver.	Time.
1.	Maxwell	12	W. Pollard	2:05 2-5
14.	Ford	15	J. G. Hydg.	2:33
GASOLINE CARS, \$851 TO \$1,250.				
3.	Overland	22	T. C. P. Forbes	1:43 1-5
4.	Reo	16	W. Lockwood	2:13 3-5
GASOLINE CARS, \$1,251 TO \$2,000.				
6.	Jackson	30	R. Burman	1:39 4-5
5.	Overland	22	T. C. P. Forbes	1:46
GASOLINE CARS, \$2,001 TO \$2,500.				
10.	Tiley	32	C. B. Tiley	1:54 2-5
GASOLINE CARS, \$2,501 TO \$3,000.				
15.	Stoddard-Dayton	36	Harry Tuttle	1:29
14.	Knox		W. Bogue	1:32
GASOLINE CARS, \$3,001 TO \$4,000.				
16.	Stoddard-Dayton	36	Harry Tuttle	1:36 4-5
GASOLINE CARS, \$4,001 AND OVER; MILLER CUP.				
24.	Stearns	30-60	C. F. Alcott	1:23
19.	Stearns	30-60	K. Swain	1:25
CRAUFURD CUP FOR AMATEUR DRIVERS, GASOLINE CARS.				
33.	Stearns	30-60	K. W. McNeil	1:20 3-5
27.	Stoddard-Dayton	36	Harry Tuttle	1:22 3-5

Jackson Which Won in its Class, and Driver Burman.

FREE-FOR-ALL BRIDGEPORT BOARD OF TRADE CUP.				
26.	Isotta	50	Al. Poole	1:17
51.	Columbia	29	Arthur Bell	1:19 4-5

The event was run under the auspices of the Automobile Club of Bridgeport, the officials being as follows: Referee,

Miller Cup Winner Stearns and Its Owner, C. F. Alcott.

A. L. Riker; executive committee, Ralph M. Sperry, President Frank T. Staples and Secretary F. W. Bolande; clerk of the course, Gregory S. Bryan; starter, J. B. Lyford; timer, A. L. McMurtry, besides which there were half a dozen umpires.

Patronage of the Lemonade Stands Was Generous at the Foot of Sport Hill Before the Start.

FAST TIMES MADE BY AMATEURS AT NEW HAVEN

NEW HAVEN, Conn., May 28.—Although yesterday's races up Shingle Hill were mainly for amateurs, some of the professionals were there to lend excitement to the big car events, though it was noticeable that their performances detracted but little from that of their non-professional brothers. As a venue for a hill-climb, the rise that goes by the name of Shingle Hill is one well calculated to tax the skill and daring of any driver, and that there were no accidents of any moment on the twisting turns was considered remarkable. There were some very close escapes, and the manner in which the cars were handled drew cheers from the crowd. This was noticeable in the case of Thompson Dill's masterly handling of the Apperson, the manner in which the Stearns and Locomobile pilots got around the twists, and the skillful avoidance of a telegraph pole by N. B. Whitfield in the Oldsmobile.

In the first event for cars of 200 cubic inches displacement, T. C. Walker took the Ford up in 1:30 4-5, while in the second class, cars up to 400 cubic inches, W. A. Burke, in a Knox, cut this to 1:12 1-5. Harry Tuttle was second in a Stoddard-Dayton, in 1:17 1-5, and Dill's Apperson was third, in 1:18 1-5. In the class for cars up to 550 cubic inches, inclusive, D. B. Brown's Fiat brought the record down to 1:06 4-5; J. S. Joyce's Locomobile was second, in 1:15 1-5; and W. C. Decker's Thomas third, in 1:15 4-5. W. W. Swan, in the Stearns, figured as a winner in the big car event, those having a cylinder volume in excess of 550 cubic inches, by making the hill in 1:07 3-5, his nearest competitor being Joyce's Locomobile in 1:15 2-5, Rus-

sell Lord's Peerless Six and Prossen's Bianchi tying at 1:15 3-5, while L. G. Hall's Stearns followed in 1:18 2-5.

The free-for-all was looked forward to with considerable interest, but did not equal the times of other events, W. W. Swan's Stearns being an easy winner, in 1:10 flat, Burke's Knox being second in 1:11 3-5, and Egbert Lillie's Itala third, in 1:12 2-5. Silver cups were awarded the winners, and in addition D. B. Brown was awarded a gold medal for the fastest time made by an amateur, while Egbert Lillie received a silver medal for second. F. B. Wittemore received the medal for making the fastest time by a member of the Yale Automobile Club, his time being 1:12 4-5, while J. S. Joyce got the medal for second place. The summaries follow:

GASOLINE CARS UP TO 200 CUBIC INCHES CYL. VOL.		
Ford.....	T. C. Walker.....	1:30 4-5
Bulck.....	Lee.....	1:35 2-6

STEARNS WINS 100-MILE AT BALTIMORE.

BALTIMORE, June 1.—On Decoration Day, at Pimlico, the first races under the auspices of the Motor Car Racing Association of Maryland were held. The feature event was a 100-mile championship race, which was won by the 60-horsepower Stearns car, owned and driven by E. L. Leinbach. His time was 2 hours and 47 seconds. In this event the 45-horsepower Acme car, owned by the Acme Motor Car Company, and driven by Jerry Price, went through a fence near the spot where Cedrino was killed on Friday. The summary of events follow:

FIVE MILES.—STOCK TOURING CARS FROM \$2,000 TO \$3,000.		
1. Oldsmobile.....	36	A. L. McCormick..... 6:21
2. Moon.....	32	E. L. Leinbach.....
TEN MILES.—MARYLAND RUNABOUT CHAMPIONSHIP: STOCK TOURING RUNABOUTS OR TOUR.		
1. Pullman.....	40	Robert Morton..... 11:45 4-5
2. Pullman.....	30	C. B. Kirkman.....
FIVE MILES.—40.1 TO 60-HORSEPOWER, INCLUSIVE.		
1. Stearns.....	60	E. L. Leinbach..... 5:31 2-5
TEN MILES.—PIMLICO FREE-FOR-ALL HANDICAP.		
1. Stearns.....	60	E. L. Leinbach (scratch) 11:07
2. Pullman.....	40	Robert Morton (23 sec.)
3. Oldsmobile.....	36	A. L. McCormick (45 sec.)
HUNDRED MILE CHAMPIONSHIP.—STRIPPED STOCK CARS OR CHASSIS.		
1. Stearns.....	60	E. L. Leinbach..... 2:00:47
2. Pullman.....	40	Robert Morton..... 2:30:47
SPECIAL EVENT.—FIVE-MILE MOTORCYCLE CHAMPIONSHIP.		
1. Indian.....		H. Matthew Gault..... 6:31
2. Indian.....		W. F. Fisher.....
3. Indian.....		Chick Thomas.....
4. Indian.....		A. L. Bear.....
5. Indian.....		George Lewis.....
6. Indian.....		Harry F. Fisher.....
7. Indian.....		William Rasmussen.....

MOTORCYCLEDOM TO HAVE A GLIDDEN TOUR.

Motorcycledom fraternity, after automobiledom, is to have an annual long distance tour on the lines of the Glidden Trophy competition. It will be promoted by the Western District of the Federation of American Motorcyclists, and cover a route of some 1,100 miles, with its start at New York on July 6 and its finish at Chicago. The competition will be by club teams. An economy test and a hill-climb will be held en route.

RECORD ENTRY FOR THE JAMAICA TRIALS.

Indications point to the straightaway time trials on Hillside avenue, Jamaica, to-morrow, being numerically the greatest race meet in the history of the sport in this country. When the entries closed on Tuesday, close to 200 had been made with 51 competing cars. The entrants embrace a large majority of the brands handled in the metropolitan district. The makes represented are as follows: Thomas, Isotta, Mercedes, Fiat, Hotchkiss, Mora, Wolsley, Corbin, B. L. M., Haynes, Ford, Pope-Hartford, Rainier, Allen-Kingston, Pennsylvania, Palmer & Singer, Mitchell, Cadillac, Peerless, Acme, Midland, Meyer, Jackson, Crawford, Stearns, Pullman, Christie, Imperial, Simplex, and the Stevens-Duryea.

The racing will begin at 1 o'clock. There are 24 events carded pretty evenly distributed at a kilometer, a mile, and two miles.

A parade open to all is to precede the racing, participants in which are promised excellent sparking space free.

BAY STATE'S MEET POSTPONED TO JUNE 17.

BOSTON, May 30.—The great crowd of people that assembled at Readville track this afternoon for the annual races of the Bay State Automobile Association was forced to go away disappointed, for after waiting more than an hour for the track to dry out the meeting was postponed to June 17. Everything was in readiness for the races, and the track was in excellent condition, when a sudden shower descended. It lasted only a few minutes but that was sufficient to spoil the track for racing purposes, though more rain fell later.

LONG ISLAND HAS ANOTHER CLUB.

HUNTINGTON, N. Y., June 1.—The large number of autoists resident in this village and vicinity have finally gotten together and have organized the Huntington Automobile Club, of which Daniel M. Gerard has been elected president; F. E. Ruland, secretary, and C. Barclay Ward, treasurer. The club will signalize its existence by holding an automobile carnival July 15.

Willie Haupt in His Great Chadwick Six Climbing "Giant's Despair" in 1:38 2-5.

WILKES-BARRE, PA., May 30.—Unless the American automobile manufacturer and driver cease their efforts to belittle the difficulties of "Giant's Despair," someone will be compelled to put on his thinking cap and suggest a name more in consonance with the facts. To-day's setting sun looked down upon a course strewn with fragments of shattered records. The breaks were none of your puny little chips off here and there, either—they were real damaging fractions, with huge chunks missing, which sadly marred the picturesqueness of the former figures. The course record was thrice maltreated in this way. The first time it was a mere chip—4-5 of a second off the White steamer's 1:49 4-5, made last year. The Stevens-Duryea Big Six, P. J. Robinson up, was the assailant. A few minutes later Willie Haupt, in the Great Chadwick Six, carved off a generous slice of 7 3-5 seconds from the Stevens-Duryea's figures, with a trip up the 6,000 feet of mountain road in 1:41 2-5. And then Haupt, just to show that the Chadwick's performance was not a piece of mere luck, repeated in 1:38 2-5—a three-second chunk this time. When it is recalled that the Chadwick's figures represent a lowering of the best previous gasoline time (Matheson's 1:59 2-5) by an even 21 seconds, and that they are 1 3-5 seconds under the wonderful mark made by Bill Wray on his 6-horsepower Simplex-Peugeot motorcycle last year, Haupt's driving can be characterized as little short of wonderful.

Eight times was the course negotiated under two minutes—thrice by the Chadwick, twice by the Stevens-Duryea, and thrice by a brace of Stanley steamers. There were many regrets expressed that the recent accident to Walter White prevented the White car from competing. Not only did the Wilkes-Barre Automobile Club officials desire to show Mr. White that they were hide-bound sports and harbored no malice as a result of past disagreements, but they wanted him and his cars there, and arranged their program accordingly.

When the first race was called at 8:30, the weather promised rain.

After the Ford had nosed out the Maxwell in the \$850-or-under gasoline class by a matter of three seconds, Jackson's 20-horsepower Mitchell had a walk-over for the \$851-to-\$1,250 gasoline class first prize, just jogging up the mountain in 4:02 3-5. When the third event for \$1,251-to-\$2,000 gasoline cars was finished, it was found that the Type 19 Acme, driven by E. Lenge, with a trip in 2:45 2-5, had made the best time; but the Acme's claim to the first prize has been disputed by W. F. Smith, the Philadelphia Rambler manager, in behalf of his entry, driven by Herbert Bitner, which got to the top with a flat tire in 4:08 1-5. The Ramblerites claim that the Acme Company does not make a \$2,000 car, and that their catalogue fails to show a car at that price. The Committee reserved its decision.

The first real evidence of speed was given in the fourth event, for \$2,001-\$3,000 gasoline cars, when the Stoddard-Dayton "45" negotiated the mountain in 2:14 2-5. The Pennsylvanians endeavored to put in their special Pennsylvania "50," a Vanderbilt Cup car, as a post entry, but the Stoddard-Daytonites, who had made the best time of the day up to that point, put in a most strenuous protest, which was upheld.

After John Dower's Model "O" Corbin "30" had made the trip to the top in 2:45 1-5 in the fifth event—steam or gasoline stock cars selling for \$2,001 to \$3,000—in a sharp shower, time was called to give J. Pluvius a chance to change his mind. Another half hour to allow the course to dry off and to get the tens of thousands of spectators back to their dripping roosts along the side lines, and the game was on once more. As the Corbin had complained of bad skidding on the greasy turns during its wet trip, the officials decided to allow it another trial to equalize matters. But the Corbin stalled just beyond the Mountain House, and first place went to the Thomas-Detroit "40," driven by Oliver Light, with a mark in 2:19 1-5. "Suppose the Thomas-Detroit had done anything slower than 2:45 1-5, the Corbin's first time, who would have been awarded first

Stevens-Duryea Big Six Starting in the Free-for-All on "Giant's Despair."

prize," was a poser handed to an official. "Never cross a bridge until you come to it," was the reply.

A walk-over in the sixth event, for \$3,001-to-\$4,000 gasoline stock cars, was the luck of the Stevens-Duryea Little Six, driven by S. H. Hancock, who sent his car up the mountain in 2:17.

The seventh event witnessed still another walk-over, but it was due to the fact that H. N. Harding, entrant of the Matheson "50," protested his only competitor out of the race for not being equipped with a pan. Referee Morrell read the rules, and reluctantly ordered O. W. Hoffman to take his 30-60 Stearns back to the park. Hoffman said he removed his pan because it rattled, and not to save the trifle in weight. The conditions called for stock equipment, and Morrell could not but decide against the Stearns when the matter had been officially brought to his attention. After the dispute was settled, C. A. Nan jogged the Matheson up the hill in 3:14 2-5, thereby annexing the Wilkes-Barre "Record" trophy.

The real form of the big fellows was first shown in the eighth event, for six-cylinder gasoline stock cars selling for \$2,500 or over. S. H. Hancock led off with the Stevens-Duryea Little Six in 2:08 1-5, and then all of a sudden the huge crowds were electrified by the announcement of a 1:52 flat trip by the Little Six's big brother, driven by P. J. Robinson, from the Chicopec Falls

But this time the car picked up beautifully, and by the time Starter Fred Brand's gun cracked, he was giving those at the start the best exhibition of speed they had seen during the day. Up the first thousand feet of 10 per cent. grade he flew on his second speed (2.6)—he afterward said he had not used his high except in practice—and, rounding the elbow, he threw in this third (3.9), which took hold beautifully without perceptibly lessening his speed, although he was now on a 16 per cent. rise. Without a change, but with his eyes glued to the course, and exerting all his strength to guide his car, he swung around the bad "S" at the Mountain House, and onto the stretch leading up to Prospect Rock, which he passed like a flash. Here he struck the foot of the long 20 per cent. pull to the top—a full 600 yards. But he knew his car and his gears after his toilsome practice of the previous days, and the big Chadwick mounted the stiff slope like a bird and flashed past the finish in 1:41 2-5. When the news of this performance was 'phoned to the start, the huge crowds gave vent to their pleasure in the characteristic American way—they shouted long and loud. The Chadwick was equipped with a full set of Continental tires.

Three additional cars tackled the job before the event was finished, but the glamour of the Chadwick's victory threw their otherwise creditable efforts into the shade. The twin Stanley "30's" both got under the two-minute mark—D. Walter Harper doing 1:59 3-5, and Fred Marriott, of straightaway mile-record fame, two seconds better—but the crowds were hungry for records, and nothing less would satisfy them.

For that reason the tenth event, open to stock chassis, with piston area not exceeding 103.87 inches, and for which Briarcliff models were eligible, fell a trifle flat. In some respects it was the best contest of the day, the cars being more evenly matched than in most of the other events. The fact that possession of one of the three legs of the crack bit of plunder in the prize line—the \$1,000 Hollenback trophy—hung on the result of the race even failed to enthuse the crowds after the wonder-

ful doings in the previous event. The Corbin, the Stevens Little Six and the Stearns all came close to the two-minute mark; the Pennsylvania Vanderbilt candidate, the Thomas-Detroit, and the Pennsylvania stock "50" did nearly as well, while the Matheson kept up the series of poor performances of the native car by a laggy 2:52. The Corbin won out in 2:02 2-5, the Stearns, with 2:04 3-5, nosing out the Little Six for the place by 1-5 of a second.

The crowd set up again when the announcement was 'phoned to the various stations that the Chadwick and a special Matheson would each make a record trial over the course. Haupt was first to face the starter. He asked for and obtained permission to take the Chadwick back of the railroad crossing a hundred yards or so to give the car a chance to gather speed before reaching the ribbon. The scheme worked to perfection, for, taking a terrific bumping as he crossed the double tracks, Haupt had the car at close to the top speed as Starter Brand gave him the gun. Out of sight up the mountain he whisked in a cloud of dust and gasoline vapor. At the successive stations—the Elbow, Mountain House, and finish—'Phoneman Cassidy got reports of his progress, and during the interval which elapsed before announcing the time, a strange stillness fell on the crowd. Although the spectators could not hear what Cassidy said to Announcer Lasher, it knew from his manner that the record had been beaten. "One thirty-eight and three-fifths!" thrilled through the 'phone, and the crowd signalized its appreciation of the unusual achievement in a manner which showed that they fully realized what climbing Giant's Despair in that time meant.

How the Course Was Kept Clear Up the Long Stretch of Wilkes-Barre Mountain.

factory. This smashed the best previous gasoline record by over seven seconds. Willie Haupt followed in the Great Chadwick, but could do no better than 1:59 3-5, due mainly to a much-too-slow start. J. Deatrich finished up the event with a 2:38 1-5 journey in his Matheson, the big Stevens thus capturing the splendid Wilkes-Barre Automobile Club trophy. Robinson came as near as a hair to having a bad accident in this event. Finishing very fast, the crowd beyond the line had not realized how far he would be compelled to go before he could stop. His, it will be remembered, was the first really fast trip of the day. Dashing over the brow of the rise and down the slight decline, the people had to scatter like sheep, and quickly, too, to avoid a bad accident. Robinson worked at his brakes like a madman, and just managed to stop short of the bulk of the jammed-in crowd. It was certainly a close shave, and afterwards, with the assistance of a force of State constabulary, the course was kept clear for quite a distance beyond the finish line.

The event of the day came next—the free-for-all. John Dower and his Model "M" Corbin opened proceedings with a trip in the modest time of 2:11 1-5. The big Stevens Six followed, with the 1:49, which broke the White course record by four-fifths of a second, which announcement woke the crowd to a realization of the possibilities. After the Thomas-Detroit had made the journey in 2:15, "Willie" Haupt got off to a start which opened the eyes of the onlookers. In the previous event he had been unable to attain sufficient speed at the getaway, and his pace when crossing the tape had been comparatively slow.

The Matheson's try resulted disastrously. It threw its left front tire on entering the Elbow and came within an ace of skinning off the outer layers of the ten-deep crowd on the inner side of the course. But Ward got his car under control in time to prevent trouble, and came dejectedly down the mountain with the inner tube spitefully slapping the road at each revolution.

The meet wound up with the event for the Quaker City Motor Club members, which was divided into three sections to give the various classes a chance to win. Fred Marriott again scored over his brother Stanleyite in the steam class—1:56 to 2:01 4-5. Bill Longstreth's Maxwell triumphed over "Tommy" Berher's Oldsmobile—2:49 4-5 to 3:14—in the \$2,000-or-under gasoline class. Haupt tried to score again in the \$2,001-or-more gasoline class, but his Chadwick was ditched when a tire went to the bad on the Devil's Elbow, giving Leonard Zengle a walk-over in his Pennsylvania "50," which reached the summit in 2:10 1-5.

While it is somewhat difficult to give comparative figures showing the improvement in time over last year, owing to the fact that the classes were differently arranged this year, the following will indicate a degree of betterment which argues well for the American manufacturer and the American driver:

Event.	1907.	1908.
Record trials	1:49 4-5	1:38 2-5
Free-for-all	1:59 2-5	1:41 2-5
Six-cylinder, \$2,500 or over.....	2:02 2-5	1:52
Between \$3,000 and \$4,000.....	2:05 4-5	*2:17
Between \$2,000 and \$3,000.....	2:31 3-5	2:14 2-5
Under \$1,000	**2:47	†3:19 2-5

*Walk-over. **22-horsepower Maxwell. †15-horsepower Ford.

Last year the Chadwick had marks of 2:02 2-5, 2:05 3-5 and 2:07; this year it registered 1:38 2-5, 1:41 2-5 and 1:59 3-5. Last year the Stoddard-Dayton made several trips around in 2:45; this year it won the \$2,001-\$3,000 class in 2:14 2-5, and carried an extra man. In almost every instance where comparisons can be made a marked improvement in time is noticeable, despite the fact that experts considered the course somewhat slower this year.

Many expressions of sympathy were heard for Walter White, and all expressed hopes for a speedy recovery from the effects of his recent accident and for another trial at the mountain next year.

Apropos of next year's climb, there was much discussion of the rumored movement to make the affair a national one by handing it over to the A. A. A. With a most liberal municipal government, which recognizes the value to the city of these annual gatherings and with an ideal course, ideally located, the national body might do worse than assume the management of what will be a sure winner and cannot fail to add to its prestige. Even now the event is considered the blue ribbon event in the hill-climbing line, in the East at least, and manufacturers cherish a win on the historic Wilkes-Barre mountain as they appreciate a victor on no other course. It is already in a measure a national fixture. "Why not," say the advocates of the scheme, "make it such in reality by passing it over to the A. A. A.? It would be like finding money." Why not? The summaries:

Time trials for course record (1:49 4-5, in 1907, held by White Steamer; 1:41 2-5, this meet, held by Great Chadwick).
 1. Great Chadwick Six..... 50 W. Haupt 1:38 2-5
 2. Matheson Six..... 50 C. A. Ward... Punctured tire.

FREE-FOR-ALL, STRIPPED AND RACING CARS.

1. Great Chadwick Six..... 50	W. Haupt 1:41 2-5
2. Stevens-Duryea Big Six..... 50	P. J. Robinson..... 1:49
3. Stanley steamer 30	Fred Marriott..... 1:57 3-5
4. Stanley steamer 30	D. Walter Harper... 1:59 3-5
5. Corbin 35	John Dower 2:11 1-5
6. Thomas-Detroit 40	Oliver Light 2:15
7. Matheson 60	C. A. Ward..... 2:18 3-5

GASOLINE STOCK CHASSES NOT EXCEEDING A TOTAL PISTON AREA OF 103.87 SQUARE INCHES.
 (All Briarcliff models eligible.)

1. Corbin 35	John Dower 2:02 2-5
2. Stearns 30-60	O. W. Hoffman..... 2:04 3-5
3. Stevens-Duryea Little Six. 35	S. H. Hancock..... 2:04 4-5
4. *Pennsylvania 50	Alfonso Gentle..... 2:13
5. Thomas-Detroit 40	Oliver Light..... 2:14
6. Pennsylvania 50	Leonard Zengle..... 2:17 1-5
7. Matheson 50	C. A. Ward..... 2:52

*Protested as ineligible, the car having been specially constructed for the Vanderbilt Cup race.

The Corbin That Won the Stock Chassis Trial.

SIX-CYLINDER STOCK CARS SELLING FOR \$2,500 OR OVER.

1. Stevens-Duryea Big Six... 50	P. J. Robinson..... 1:52
2. Great Chadwick Six..... 50	W. Haupt..... 1:59 3-5
3. Stevens-Duryea Little Six. 35	S. H. Hancock..... 2:08 1-5
4. Matheson 50	J. Deatrich 2:38 1-5

FOUR-CYLINDER STOCK CARS SELLING FOR \$4,000 OR OVER.

1. Matheson 50	C. A. Ward..... 3:14 2-5
----------------------	--------------------------

GASOLINE STOCK CARS SELLING FROM \$3,001 TO \$4,000.

1. Stevens-Duryea Little Six. 35	S. H. Hancock..... 2:17
----------------------------------	-------------------------

STEAM OR GASOLINE STOCK CARS, \$2,001 TO \$3,000.

One of the Pennsylvania Cars That Competed.

Trucco in His Winning Isotta Rounding a Bad Turn.

PALERMO, SICILY, May 20.—Trucco, on an Isotta Fraschini, has won the third annual Targa Florio, Europe's first big car race of the season; Lancia is the eternal second, and Nazzaro, for the first time, has been put out of the running by a sharp skid on one of the mountainous turns followed by the overturning and smashing of his car.

With the exception of a French Berliet, Italy had the 379-mile mountain race with its 1,432 sharp turns for each of the three rounds entirely to itself, French constructors preferring to reserve their forces for the series of 155-millimeter races opening with the Grand Prix. As an all-round testing ground of the value of a car, the Sicilian course selected by Vincenzo Florio for the race which he has originated and brought to such popularity is certainly the acme of perfection. The 93

The Berliet on One of the Course's Tortuous Stretches.

miles of road start from the level of the sea, climb around a volcanic mountain, then descend again to the seashore, twisting and winding the whole time at the rate of 15 turns to the mile, giving one sharp swing every 117 yards. No wonder some of the drivers declared they felt seasick.

Trucco, the winner, managed to cut 28 minutes off Nazzaro's last year's record, covering the three rounds in 7:49:25, being an average of 35.5 miles an hour. From beginning to end his 5.1 by 5.9 four-cylinder Isotta Fraschini ran without a stop or attention to its mechanism. It was not the same, however, for the tires, all four of which had to be changed by the winner at the beginning of the third round, owing to the terrible racking effect of the stony mountain road.

Lancia, who started first but finished second, 13 minutes 15 seconds behind the Isotta, really lost his race through bad luck with his tires. On the first round he was running practically dead heat with his companion, Nazzaro; at the end of the second lap he had got first, with Trucco a minute behind and Nazzaro three minutes in the rear. Then the ill luck came along as usual, and the big Italian had to close down his engine three times in succession to change tires. Even with dismountables the operation was not fast enough to catch the speedy and more fortunate Isotta, and Lancia, though the first to cross the finishing line, had again to be registered for second

Signor and Signora Fraschini in the Isotta.

prize. There is perhaps a little satisfaction in having beaten Nazzaro's record by the ample margin of 15 minutes.

Ceirano, another son of Italy, took third place on an S. P. A., seven minutes behind Lancia. Porporata, handicapped on the Berliet by reason of his small power, was fourth place by sheer regularity of running, and fifth, sixth and seventh places were taken by Isotta Fraschini, Junior, and Itala, this last named firm taking part unofficially and having its car handled by an amateur.

The six to drop out in the terrible struggle comprised Nazzaro, disabled by reason of a serious skid; Raggio on the S. P. A., with broken valves; Venezia, on the same make of car with a broken wheel; Minoia, on Isotta Fraschini, as the result of a spill; a Züst and a Franco. The official classification is as follows:

1. Isotta Fraschini, Trucco.....	7:49:25
2. Fiat, Lancia.....	8:20:40
3. S. P. A., Ceirano.....	8:50:13
4. Berliet, Porporato.....	8:22:32
5. Isotta Fraschini, Giovanzini.....	8:38:27
6. Junior, Tamagni.....	9:56:08
7. Itala, Pizzagalli.....	9:58:05
Winner's average, 35.5 miles an hour.	
Previous record, Nazzaro, Fiat, 8:17:36.	

Wagner, who was to have completed the Fiat team, was withdrawn, owing to his engagement in the St. Petersburg-Moscow race at the end of the month.

CONCERNING PETROL AND SOME PETROL TESTS*

By G. H. BAILLIE.

UNTIL 1906, fuel for motor cars seemed a comparatively unimportant subject. Good quality petrol could always be obtained at a reasonable figure, and its cost was much less than the cost of tires. Then came the period when petrol was very expensive, and though it is now cheaper, this period has left behind a certain apprehension that it may again reach famine prices. Then, too, commercial motors came to the fore, and in running these petrol forms a very important item in the costs. The result has been that more attention has been paid of late to the question

much evaporation, and it is probable that a great deal of it is done in the cylinder itself, where the temperature is high. But any fuel reaching the cylinder in a liquid state is liable to give deposits. If it settles on a very hot part, such as the exhaust valve or piston head or any old deposit, or if any remains liquid when combustion takes place, the liquid "cracks" instead of evaporates, and gives rise to a tarry deposit which eventually carbonizes.

It is to get an idea of the quality of a petrol in this respect that hydrometers are used to test the specific gravity, and this specific gravity test has been the only one applied to petrols in practice. The specific gravity test, though, tells very little. Later I will give, as an example of how little it tells, a case which occurred in practice.

Another test is by fractional distillation, and is the only one which gives any real information. It is an indirect test, being really an analysis of the fuel. I have distilled in this way most of the fuels now on the market, and the results are shown in Figs. 1 and 2. Fig. 1 contains the boiling point curves, and Fig 2 the specific gravity curves.

In Fig. 1 the abscissæ represent percentages of the total volume of liquid distilled off, while the ordinates represent the temperatures at which the different portions boil. In Fig. 2 the ordinates represent the specific gravities of the different portions. Fig. 3 contains similar curves for two petrols, A and B, of which A was adopted for the *Circuit des Ardennes* last year. Petrol A is remarkably good, the specific gravity of the last tenth being only .715 and its B.P. only 85 degrees. The specific gravity of the whole petrol was .690. Petrol B had the same specific gravity, and so by the specific gravity test would be reckoned equally good, but the curves show that its composition is very different. The last tenth has a specific gravity of .747, and the mean specific gravity has been brought low by adding or

of fuel, and there are now on the market a variety of fuels, American petrol of heavier grades, Borneo .760 spirit of rather different constitution, mixtures of petrol with heavier oils, and various kinds of benzols.

It is easy enough to formulate what a good fuel should be.

1. It should enable the engine to start easily from cold.
2. It should not smell too bad before or after combustion.
3. It should run the car as many miles as possible to the shilling.
4. It should not lead to deposits in the cylinder or on the valves under any of the various conditions of running.

Conditions 1 and 2 do not require any special test to be formulated for them. Anyone can make both tests for themselves with an engine and a nose. Conditions 3 and 4 are not so easy to test. One may find that a new fuel does not run the car as many miles as does its accustomed fuel, but it does not follow in the least that the new fuel is not so good. Its specific gravity may be different, and require a different weight of float. Its viscosity may be greater, and require, therefore, a larger jet to give sufficient fuel. It may take a larger amount of air for combustion, and, finally, it may be less volatile, and may not be fully evaporated and utilized. The number of miles to be got out of a shilling's worth of fuel depends on three things: First, the price per gallon; secondly, the calorific value per gallon; thirdly, the extent to which the fuel is utilized.

What I propose to discuss now is the extent to which the fuel can be utilized, and condition (4). These both amount to the same thing—the readiness with which the fuel evaporates, or its volatility. The ideal fuel would all vaporize in its passage along the induction pipe from jet to inlet valve. Probably no fuel does it. In an engine running at 600 r.p.m. the time of transit from jet to inlet valve is of the order of 1-100 second, depending, of course, on the diameter and length of the inlet pipe, while the whole time available before compression stroke is 1-20 second.

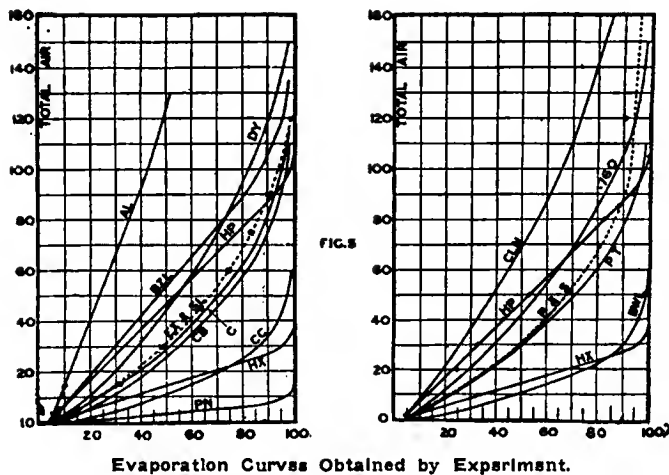

One hundredth of a second is a very short time in which to do

retaining some very light spirit of .650 specific gravity. The ideal spirit would have a constant composition, with the same specific gravity and B.P. for all its fractions, and A approaches this very closely. Petrol B, on the contrary, is a mixture of heavy and light spirit, and, though a good spirit from the English point of view, was regarded as bad in the French book from which I took the curves.

In Figs. 1 and 2 are seven horizontal straight lines. These represent the curves for seven pure fuels—pentane, hexane, heptane, benzene, octane, nonane, and absolute or ethyl alcohol.

*Extract from paper read before the Royal Automobile Club, London, May 14, 1908. Petrol is the English term for gasoline, and paraffin corresponds to kerosene. The letters identifying the curves in Figs. 1, 2 and 5 refer to various brands of fuel on the English market. See Fig. 6.

Evaporation Curves Obtained by Experiment.

Hexane and heptane are the chief constituents of petrol, and octane enters also to a greater or less extent into every petrol. The American petrols consist almost entirely of members of the paraffin or saturated series of hydro carbons. Table I gives the properties of the earlier members of this series:

TABLE I.—Properties of the Principal Constituents of Fuels.

Formula	Density at 15 deg. C.	Boiling point	Lower calorific value per liter
Butane	.600	1	—
Pentane, iso-	.628	31	—
Pentane, normal	.626	36	—
Hexane	.674	68.5	7155
Hexahydrobenzine	.760	69	—
Hexahydrotoluene	.772	97	—
Heptane	.688	98	7380
Octane	.719	120	7660
Octane, normal	.707	125	—
Nonane, a	.740	136	7900
Nonane, normal	.722	150	—
Decane	.738	180	8060
Benzene	.884	80.4	9690
Toluene	.871	111.0	—
Ethyl alcohol	.794	78.3	5270
Methyl alcohol	.797	66.0	—

The petrol hydrocarbons are arranged in the order of their boiling points, and it may be noted that the densities and boiling points increase together only in one and the same series. Of the two naphthenes given, which are found in Eastern petrols, hexahydrobenzine has the same boiling point as hexane, but a density of .760 instead of .674, and hexahydrotoluene, with the same boiling point as heptane, has a density of .772, while that of heptane is .688. The density therefore forms no ground on which to condemn a fuel. Industrial alcohol is composed of 90 per cent. of ethyl alcohol (with some water) and 10 per cent. of methyl alcohol or wood spirit.

The hexane, heptane, and octane lines on Fig. 1 and 2 show roughly the composition of the different fuels represented by the curves. They show it roughly only, because certain fuels contain other hydrocarbons than those of the paraffin series. Paraffin is represented by the extreme right-hand curve in Fig. 1, this curve showing only the lightest fractions. I might here call attention to the confusion that often arises between "benzene" and "benzine." Benzene is a definite hydrocarbon, with formula C_6H_6 , and is a coal-tar product. Benzine is a popular name for a certain class of spirits distilled from petroleum, and both names are frequently used for benzol or a mixture of benzene and other coal-tar spirits.

The petrol curves all show the presence of pentane, hexane, heptane and octane, or hydrocarbons of other series with corresponding boiling points. Several reach a higher boiling point than that of octane, and one, the mixture of petrol and shale oil, contains a thick dark brown residue having a boiling point of 273 deg. Cent.

The first thing to find out is the minimum temperature at which it is possible for a fuel to exist as vapor under normal atmospheric pressure. This is obtained from the vapor-tension curve of the fuel, which is a curve giving the minimum temperature at which the vapor has a certain pressure. As it has been found

that the best results are obtained in an engine when the mixture contains about 30 per cent. more air than the quantity theoretically sufficient to completely burn the fuel, I have worked out the results for four mixtures—that containing the right amount of air theoretically, and those with 20 per cent. less, 20 per cent. more, and 40 per cent. more air. The figures are given in Table II.

TABLE II.—Minimum Temperatures at which Fuel Exists as Vapor.

Air	20 per cent. less	Right amount	20 per cent. more	40 per cent. more
Hexane	-14.2	-17.7	-20.6	-24.2
Heptane	7.3	3.6	0.7	2.0
Octane	22.9	19.0	16.0	13.0
Decane	46.1	42.0	39.0	36.5
Benzene	-0.7	-4.3	-6.9	-8.3
Ethyl alcohol	26.5	23.3	20.7	17.8

From this it appears that octane, decane and alcohol cannot exist as vapor under ordinary atmospheric conditions except in very weak mixtures. The large difference between benzene and alcohol accounts for some of the difficulty in using the latter as compared with the former in an engine.

But if these fuels were mixed with the air in the form of liquid at these temperatures, they would not vaporize completely, for in evaporating they reduce the temperature. The fall in temperature due to evaporation can be calculated from the latent heats of the fuel and the specific heat of the air. Table III gives the drop in temperature for the same fuels.

TABLE III.—Drop in Temperature due to Evaporation.

Air	20 per cent. less	Right amount	20 per cent. more	40 per cent. more
Hexane	23.3	19.0	16.3	14.2
Heptane	22.4	17.9	15.0	12.8
Octane	21.5	17.2	14.3	12.3
Decane	18.5	14.8	12.4	10.6
Benzene	47.3	32.2	23.5	20.9
Ethyl alcohol	95.5	76.3	63.7	54.6

Here, again, alcohol in evaporating lowers the temperature twice as much as benzene does. Benzene, too, which, according to Table II, can vaporize at about the same temperature as heptane, produces twice as big a drop in temperature as heptane does.

If the figures in Tables II and III be added together the result gives the minimum temperature which the air must have before the fuel is evaporated in order to completely evaporate it. Table IV gives these temperatures.

TABLE IV.—Minimum Temperature of Air before Evaporation.

Air	20 per cent. less	Right amount	20 per cent. more	40 per cent. more
Hexane	9.1	1.3	-4.3	-10.0
Heptane	29.7	21.5	15.7	10.8
Octane	44.4	36.2	30.3	25.3
Decane	64.6	56.8	51.4	47.1
Benzene	46.6	27.9	16.6	12.6
Ethyl alcohol	122.0	99.6	84.4	72.4

With the right amount of air none of the fuels except hexane can be evaporated completely in a cold engine, while alcohol requires the air to be at the boiling point of water for complete evaporation. With 20 per cent. more air, heptane and benzene can be vaporized cold.

Another factor, however, enters into the question, and that is the rate of the evaporation. The time available is very short, and not nearly enough to evaporate the fuels at the minimum

Showing Comparative Volatility of Various Fuels.

temperature. The evaporation of liquid goes on at a slower and slower rate as the space into which it evaporates becomes filled with the vapor.

August's approximate law states that the time required for evaporation is proportional to $\log \frac{P}{P-p}$, where P is the maximum and p is the actual vapor pressure at the temperature in question.

The effect of the time required for evaporation can be estimated only by calculating from this expression the different temperatures which will cause the fuels to evaporate in the same time, and by arbitrarily assuming for one fuel, say, hexane, that a certain increase of temperature above the minimum is required to evaporate it sufficiently fast.

I have assumed that for hexane in a theoretically correct mixture the air should be at the normal temperature of 15 degrees Cent.—that is, that 13.7 degrees. must be added to the minimum temperature to evaporate the fuel quickly enough. On this basis I have calculated the additional temperatures to be added in the case of the other fuels to produce evaporation in the same time. Table V gives these temperatures added to those of Table IV.

TABLE V.—Temperatures before Evaporation to Cause Evaporation in the Same Time for each Fuel.

Air	20 per cent. less	Right amount	20 per cent. more	40 per cent. more
Hexane	26.8	15	6.6	-2.8
Heptane	71.4	58.4	48.7	40.2
Octane	104.6	91.4	81.0	72.4
Decane	149.3	136.0	126.4	118.4
Benzene	81.0	57.3	42.8	34.4
Ethyl alcohol....	181.9	154.3	135.4	120.3

The proportion of these temperatures which represents the time element is certainly somewhat arbitrary, but I think that the figures represent as closely as is possible on theoretical grounds the temperatures which would make the different fuels equally volatile under motor car conditions.

In Fig. 4 these fuels, with the right amount of air, are put on a scale of temperature, and since the more volatile the fuel is the lower is the temperature required for evaporation, the scale of temperature may be regarded to some extent as a scale of volatility, or rather a scale of non-volatility.

Why "Flooding" Is Usually Necessary to Start.

Heptane and benzene can, we know from experience, be used readily in engines, even starting from cold. But the temperature of 58 degrees required for their evaporation shows that they do not fully evaporate till the mixture comes in contact with the hot gases in the cylinder. In actual petrols there is always hexane present to facilitate starting, and the fact that it is so often necessary to flood the carbureter to obtain an abnormal quantity of petrol also shows that the evaporation of the heptane is far from complete when there are no hot gases to give the requisite temperature. Anyone who has used a surface carbureter of the old motor bicycle type knows what starting from cold on heptane is like; the "stale" petrol that these carbureters so often produced was simply petrol from which the lighter constituents had been evaporated off.

The benzols of commerce also have certain constituents lighter than benzene, though only in small quantity; but apart from these, starting from cold is comparatively easy, because a much lower temperature is sufficient to give a weaker mixture, but one which will still fire readily. With benzine the temperature diminishes more rapidly as the mixture becomes weaker than it does with heptane, and benzene has the further advantage over heptane that a mixture with 100 per cent. more than the right amount of air is combustible, while heptane is not combustible with more than 75 per cent. more air.

Decane is the lightest constituent of paraffin which is present in any quantity, and from the table appears to be rather more volatile than alcohol. The temperatures of these fuels seem high, but when it is remembered that the residual gases in the cylinder are at 300 or 400 degrees Cent. their evaporation in a hot engine

is explained. All the evaporation though must take place in the cylinder, and there is every chance for the formation of deposit.

Fig. 1 shows that benzene has a higher boiling point than alcohol, while Table V shows that it is far more volatile than alcohol under engine conditions. As we know from experience that it is far more volatile, we may perhaps conclude that the calculations leading up to Table V give a better idea of the volatility than do the boiling points. Unfortunately these calculations are applicable only to pure substances, not to our actual fuels, which are mixtures. A mixture of two hydrocarbons in a certain proportion gives off vapor which also contains the two hydrocarbons in a certain definite but a different proportion, there being more of the lighter constituent in the vapor than in the liquid, and the presence of the lighter constituent enables the heavier to evaporate more readily than it would if alone. A petrol, then, evaporates as a whole, heavier constituents evaporating more slowly than the lighter, but more quickly than they would if not mixed together. The volatility of these complex mixtures is therefore impossible to calculate, even if all the constituents are known, and it can be found only experimentally.

How the Evaporation Tests Were Made.

I have worked out a kind of surface carbureter to act as a testing apparatus measuring the volatility of the fuel. The apparatus consists of a graduated tube terminating below in a stop-cock and above in a large bulb, with an opening to the air. Near the bottom of the tube a side tube is introduced and is connected to a foot-bellows. The tube is filled with the fuel to be tested, the quantity being read on the scale. The bellows is then worked steadily, each stroke driving the fuel into the bulb and thoroughly mixing it with the air. The opening from the bulb is so protected that none of the fuel is carried off mechanically with the air. After, say, ten strokes the height of the fuel is read off, the scale indicating how much has been evaporated. After another ten strokes the loss is again ascertained, and so on, till the whole of the petrol is evaporated. The petrol tube is surrounded by a water bath, so as to maintain the temperature constant.

Fig. 5 shows the curves obtained from this apparatus for all the fuels I could get hold of. The abscissæ represent the percentage of fuel evaporated and the ordinates represent the number of strokes of the bellows, or, what amounts to the same thing, the amount of air blown through the petrol. All the points coincide within the limits of accuracy of the method. Above these come the .760 Spirit, and above this Dynol. In the mixture of petrol and shale oil, the petrol and the shale oil seem to evaporate one after the other. Up to 85 per cent. the curve is much the same as the ordinary petrol, then the shale oil begins to show, and no amount of blowing would get off the last 5 per cent.

Fig. 6 is a series of curves derived from the curves of Fig. 5. The abscissæ are successive twentieths of the total volume, and the ordinates are the strokes of the bellows, or quantity of air required to evaporate each successive twentieth—not, as in Fig. 5, the quantity of air required to evaporate all the volume up to the twentieth considered. The ordinates therefore represent, one may say, the volatility of each twentieth of the fuel; the fuel being less volatile the higher the ordinate. In Fig. 6, therefore, the pure fuels are horizontal straight lines, showing constant volatility throughout, and the curves have the same characteristics as the boiling-point curves of Fig. 1. Benzol and heptane have much the same volatility, alcohol being far less volatile. Of course, the amount of air for evaporation cannot be regarded as a *measure* of the quality of a fuel. In the case of a new fuel being put on the market the evaporation test would enable the volatility to be compared with that of the older petrols of known properties, and a value could be got at once placed on it in this respect. If the test should turn out to be of any practical service different apparatus could be standardized by making an evaporation test of heptane, which can be procured cheaply in a fairly pure state, and by thus establishing a coefficient belonging to each apparatus the readings of different apparatus could be made comparable.

SIMPLIFYING TRANSMISSION OF POWER ON AN AUTO

By L. M. DIETRICH, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

NOTHING short of a ponderous volume would begin to suffice to record half the attempts that have been made in the past few years to simplify the method of transmitting the power from the motor to the rear wheels in an automobile. From them all current practice may be said to have settled down upon a system employing a clutch, a change-speed gear, countershaft and chains, or propeller shaft and bevel gear drive at the rear axle. To reduce the number of these essentials and to simplify the

Shaft *A* is loose in the bearings of the side discs, and the wheel *a*, turning on *o* of the support on *A*, simply revolves on the support and imparts no motion to the shaft as long as the two discs *b* and *c* turn at a uniform rate in opposite directions. If one disc is slowed down, the wheel *a* travels with the faster disc, and turns the shaft *A* just in proportion as the speeds of the two discs vary. But in the Dietrich drive both discs are driven positively by gears or friction, as desired. The change of speed is accomplished by making the driving discs concave and swinging the floating disc *a* on its center *o*, as shown in Fig. 2. With the disc *a* horizontal the shaft *A* receives no motion, but, swinging to either position shown, the shaft *A* turns in the direction of the disc on which *a* runs nearest the circumference. If it tips up to 1 it will run with that disc, and if to 2, it runs with the disc 2. This, then, gives both forward and reverse motions to *A*, or allows it to stand perfectly still if *a* is kept horizontal.

Following the application of this principle in the driving axle in Fig. 3, it will be seen that here the motor drives the gear *A* through the shaft from the motor. To reduce the length of the device the convex discs are not parallel, but angular, and the outer discs *D* are driven through the bevels *B* and *C* to get the right surface speed of both discs. All gears and floating discs run on Hess-Bright ball bearings, and the floating discs are controlled by the linkage system shown, a movement of the speed lever or pedal moving the floating disc into any position for forward or reverse or for stopping the car.

To do away with the differential there is a drive for each half of the axle, as shown in Fig. 3. The linkage system is connected to the speed pedal by the center rod and to the steering mechanism by the rods *S S*, so arranged that the turning of the steering wheel drives the wheels at the proper speed for turning the corner, and, unlike the differential gear, each wheel is driven positively whether on slippery pavements or in soft ground. There is also a simple device at *R* which takes care of different roads and grades when desired by acting through the same links to slow down or accelerate, as the case may be, and so utilize the full power of the motor or such portion of the power as desired at all times when nothing is in the way. The device is very simple and is intended to be used principally on motor trucks, with a constant-speed motor and the device set for, say, 10 miles an hour speed on the level. Then, on coming to a heavy grade the speed would come down to perhaps three miles an hour, and would return to 10 miles when the level was again reached, and no matter how much it slowed down, it would always climb the hill at some speed unless the wheels slipped.

The device depends on the friction of the floating disc and the driving discs on the side, but unless these surfaces slip they are positive as gears except, perhaps, for a slight creeping of the surfaces. Compressed cork has been chosen as the material for the bearing surface of the floating discs. Tests show that the dynamic coefficient of friction is 0.35 for cork on cast iron, as against 0.15 for steel on bronze, while for static friction this rises to 0.89 for polished cork against polished cast iron running in oil under a contact pressure of about 50 pounds. The elasticity of cork gives a surface contact instead of a line contact, as with a harder substance, and the fact that it holds well on cast iron and is not affected by oil is in its favor. Then, too, it will be seen that the peripheral speed of the floating disc is constant, regardless of the speed of the driven shaft, so that the driving power is not impaired by slowing down the surface speed.

Briefly stated, some of the advantages of the Dietrich Universal drive, as compared with both the usual type with clutch and sliding gear, and the friction type, claimed for it by its designer, are its unyielding power transmission up to the point of deformation of the material under low local duty. Noiselessness in operation and simplicity and cheapness of construction.

Fig. 1.

Fig. 2.

Illustrating the floating disc principle and its action.

resultant device has been the aim of countless inventors, but the majority of devices brought forth for the purpose have seldom been worth a second thought, while many involved more complication than they did away with.

The Dietrich Universal Drive axle, which is the invention of L. M. Dietrich, 2507 East Twelfth street, Kansas City, Mo., is quite an exception to the usual attempt along this line and is well worthy of attention. As its name indicates, it is designed to embody all of the essentials in question in a single unit and its range of movement is not confined to a certain definite number of steps, as is the case with the sliding gear, for instance. The basic principle on which it works is neither new nor revolutionary, but the inventor has evolved a plan for applying it to the needs of the purpose in view that is essentially different and that has been very carefully worked out. Before describing the device itself, its principle may be made clear by the small cuts.

Fig. 1 shows a driving device of three discs or bevel gears. *b*, *c* and *d*, *d* being the driver from the motor or other source of power. This will drive discs *b* and *c* in opposite directions.

Fig. 3—Dietrich universal automobile driving axle.

LETTERS INTERESTING AND INSTRUCTIVE

TIMING A MOTOR WITH WORN VALVES.

Editor THE AUTOMOBILE:

[1,390.]—I recently wrote the manufacturers about my four-cylinder car in regard to the timing. They advise me the engine is timed as follows: "Exhaust opens 5-8 inch before bottom center and closes top center. Intake opens top center and closes bottom center. Engine fires a little less than 3-16 inch past center of compression stroke."

I do not thoroughly understand the time given and shall appreciate your advising me if you can tell me how many degrees past center (flywheel measurement) the exhaust opens, also the number of degrees past center when the engine fires. I can readily understand it about the degrees, but not about the timing as given. The push rods and valve stems have been worn down some, but there is as much as a 1-8 inch difference between them; the former is 3-8 inch diameter, and the latter 5-16 inch. I understand they should be just barely separated. Can you advise me of a way to build them up? Under the circumstances the engine does not develop its full power.

J. G. S.

Louisville, Ky.

It is customary to have the exhaust valve begin to open 30 to 35 degrees on the flywheel circle, in advance of the piston reaching the lower point of its stroke. The intake valve should not close at the bottom center, but should remain open until the piston has traveled slightly beyond on the up stroke in order to aspirate as full a charge as possible. This should be 10 to 15 degrees on the flywheel circle. The ignition should take place exactly at the upper dead center, or close of the compression stroke. The nearer this requirement is fulfilled, the greater will be the power of the motor, as it will then comply with Beau de Rochas' principle of firing the charge at the point of maximum compression. Lag of the various essentials of the ignition system is usually the cause of the ignition taking place late, though the amount you mention is, practically speaking, a negligible quantity where everyday service is concerned. Wear of the valve stems and tappets would be apt to bring about late opening and early closing of the valves, which would be detrimental to its efficiency. To correct such a condition, several expedients may be resorted to. Small pieces of rod of the same size may be welded on to the stems, and then ground down until exactly the right size is reached, or the end of the stems may be drilled and tapped and a piece screwed on to them.

DIFFERENCE BETWEEN AN H. T. AND AN L. T.

Editor THE AUTOMOBILE:

[1,391.]—Is there any difference between an H. T. and an L. T. magneto? About what voltage does a magneto give? What is gained by letting water drip on the exhaust pipe and having the air intake so arranged that it will draw in the steam. Could a single-unit coil and high-tension distributor be used with a storage battery? How is "prix," as in the Grand Prix race, pronounced?

San Diego, Cal.

H. B. P.

There is considerable difference between a high-tension and a low-tension magneto, particularly where what is known as the true high-tension type of magneto is concerned. On the armature of the latter, there is both a primary and a secondary winding, as in an induction coil. There is also a condenser to prevent sparking at the contact point, a contact maker, or timer, which runs synchronously with the motor, and a high-tension distributor, also running synchronously with the motor. Thus, the machine is a perfectly self-contained ignition outfit in itself, generating the current at low-tension, transforming it and distributing it. In the low-tension magneto there is only a single winding of heavy wire on the armature, and the current is utilized at the voltage at which it is generated. No transformer or high-tension distributor is thus necessary. The voltage of any generator depends upon its speed, but it is nothing uncommon for a magneto's e. m. f. to exceed 100 volts. Steam thus introduced has a cooling effect, but is little advantage. "Prix" is pronounced as if spelled pree, the x being silent.

IS IT THE GEAR-SET OR THE MOTOR?

Editor THE AUTOMOBILE:

[1,392.]—I have a double-opposed engine in my automobile with planetary transmission, two speeds forward and reverse. The low speed for some time has been very much slower than originally, the present gait being hardly one-half of what was formerly developed; it is so slow that unless on a good smooth road it is hard to shift to high speed. Have tried different adjustments without improvement. Have run car with cover plate off of transmission to be sure the slow speed band don't slip; also examined pinion on shaft and find it tight. The planetary gears are in perfect condition. There is no friction in transmission. Can you offer any suggestions for remedying this trouble?

S. F. ALSTON.

Tuscaloosa, Ala.

Are you not barking up the wrong tree in ascribing the fault to the gear-set? The fact that the low-speed members of the gear-set run very slowly, thus causing the car to do likewise, would not prevent you from shifting to the high if the motor is pulling all right, as it is easily possible to start small runabouts directly on the high speed by taking care in making the engagement, so that as long as the car is moving at all there should be no difficulty in making it pick up on the high speed. If your examination has satisfied you that there is nothing wrong with the gear-set, we think it is time that the motor were examined. None of the pinions in a planetary gear-set could become displaced without interfering with the others and making the fact very audible. You will probably find that the motor is not developing its rated output.

HOW MUCH WILL A PROPELLER PULL?

Editor THE AUTOMOBILE:

[1,393.]—How can you find what a fan will pull, that is, dead weight; its resistance in power of the following size: a wheel 6 feet in diameter with 24 blades, 6 inches at the outer end and 3 inches at the inner or near the center, and set to catch the air at 11-2-inch dip, running at a velocity of 100 revolutions per minute. Weight not to exceed 16 pounds?

SUBSCRIBER.

Antwerp, O.

The only practical way of ascertaining this would be to build an experimental fan and try it on a spring scale. There is more or less data of recent origin on this, but we do not find it available at the moment, earlier data being all of a different nature, i. e., the volume of air that fans of certain dimensions will deliver. We think you have made a mistake in adopting such a number of vanes for the fan, or propeller, as the most successful types have but two or four blades. It is, however, necessary to run them at high speeds, and their efficiency would be practically nil at the speed you mention. Build an experimental four-bladed fan with the vanes so arranged that the pitch may be altered as desired, and run it from 1,000 to 1,500 r.p.m., registering the pull on a spring scale. The weight of the apparatus has no effect on its capacity, but it would be inconvenient to have a heavy propeller on an airship.

EXPLAINING A PUZZLING LOSS OF POWER.

Editor THE AUTOMOBILE:

[1,394.]—I have an Autocar runabout and last fall experienced considerable trouble with it, due, I think, to the carbureter. I could not start it until I put some gasoline in the cylinder, and after the engine started I would open the throttle and the motor would not speed up, it would make carbureter shots and sometimes would almost stop. I adjusted both the air and gasoline, but could not get it to run smooth. I had to run on intermediate gear most of the time, as I could not get power enough to drive it on direct; the coil seemed to be all right, as I could get a good spark on the plugs. Do you think I should change the carbureter? I have a Schebler Model D. The engine worked fine in the summer. I have recently ground the valves, overhauled it with the exception of cleaning the cylinders (by the way, it is a two-cylinder car), but it does not seem to have its old power, running good for a

quarter to half-mile, and then it makes muffler shots and slows down; then, after awhile, it will spurt up and run as before for quarter to half mile. Do you think the trouble is due to the carbon on piston, or is it the carbureter? M. ROBINSON.

Daretown, N. J.

We have known a case, exactly parallel to this, to have been caused by feeding an excess of lubricating oil. The car was an old one and the oiler had degenerated to a point where it no longer fed properly, the vibration causing it to empty very quickly at times. The engine was of the horizontal type and the excess oil worked its way into the combustion chamber and found its way to the spark plug points with the result that the motor acted in exactly the way you describe. Cleaning the cylinders out and regulating the oil supply may prove a remedy for your trouble as it did in the one in question.

ERRATIC ACTION AT SLOW MOTOR SPEEDS.

Editor THE AUTOMOBILE:

[1,395].—I am having some trouble with my motor and would like your opinion as to the cause, and advice as to remedy. The machine runs beautifully, with plenty of power and speed, and with never a miss with the throttle well open, but when I try to run at slow speed it picks up slowly and fires back through the muffler, indicating that mixture is too weak; when I open the needle valve enough to remedy this, I get black smoke at muffler and missing when I open the throttle, and even then I get an occasional explosion through muffler. My diagnosis of the trouble is that the carbureter float is too low, but I do not want to change it until I am sure this is correct. S.

Alton, Ill.

Considered purely from the practical point of view and letting theory aside for the moment, there is not half as much real importance to be attached to the level of the float in the fuel chamber as many of the would-be experts would like to have one believe. Take practically any motor that is in fair running condition, and while it is under way shut off the gasoline. In nine cases out of ten, it will continue to run smoothly, and in fact, will run better toward the last on what fuel is in the float chamber, until the latter is practically exhausted, sometimes almost dry. If the float is about 1-16 inch below the level of the spray nozzle in the carbureter of your car, we should not advise tampering with it. Some of the foreign cars have the stems of the float made so that there is a large range of adjustment for the height of the float, holes being drilled transversely through the stem in different directions, so that the float may be raised or lowered by small fractions of an inch, merely by drawing out and reinserting a small pin. But where the float has been placed anywhere below the level of the spray nozzle, as allowed by the adjustments, we have failed to find any difference in the motor's running regardless of the number of changes that were made one way or the other. In giving more gasoline, you doubtless went to the other extreme, as a very slight fraction of a turn of the needle valve will frequently make a very perceptible difference. With the motor running, shut the gasoline off at the needle valve very slowly, until the motor is just getting sufficient to run steadily without missing. To do this, it will be necessary to cut the supply down to the point where the motor actually does miss. Then open it again, equally slowly, until it will run steadily. The fact that there are explosions in the muffler at low speeds is equally indicative of the fact that the mixture may be too rich. See that the auxiliary air valve is working properly.

INQUIRIES ON A NUMBER OF TOPICS.

Editor THE AUTOMOBILE:

[1,396].—I have a 24-horsepower, two-cylinder, double-opposed, four-cycle, water-cooled, long-stroke engine. Will a weak battery give as much power to the engine as a strong one, fuel being the same, as long as it doesn't misfire; and does a larger amount of lubricating oil tend to heat or cool cylinders (light-feed oilers)? With good care and a mileage of 1,000 miles per year, how long should the above type of engine give good service, subject to repairs as needed (four-passenger car)? Will the ignition system give an engine more power than batteries? Which is the best, high or low tension? I noticed the trouble of M. F. Parrish of Monroe,

Ind., in your issue of April 9; he does not state whether the engine slows down and stops when he throws the friction wheel to the driver or not. I would like to hear from him again, as I have had similar troubles. C. A. GOODRICH.

Argentine, Kan.

The weak battery will cause the time of ignition to be delayed more or less, owing to the greater lag in the ignition system due to the failing strength of the current, but so long as the spark is sufficient to fire the motor regularly, experiments show that the difference in the power will be practically negligible. This is disputed by many authorities, but an exhaustive series of experiments carried out to determine just this question seemed to show pretty conclusively that so long as the spark was sufficient to fire the charge in good time, the heat or size of the latter made little perceptible difference. A larger amount of lubricating oil will tend to keep the cylinders cooler, provided the supply is not in excess of the needs of the moving parts, so that the oil is forced up into the combustion chamber, in which case it will carbonize and sooner or later caused premature firing. The magneto ignition system is generally conceded to be far superior to any using batteries and greater power and speed are obtainable from an engine thus equipped. We call Mr. Parrish's notice to your inquiry.

FIGURING RATIOS OF A FRICTION DRIVE.

Editor THE AUTOMOBILE:

[1,397].—I wish to convert my car to a friction drive. It has a 12-horsepower engine, 28-inch wheels, sprocket on rear axle, 36 teeth; front sprocket on shaft, 9 teeth; weight of car, 1,500 pounds. What diameter shall I make the friction wheel and what should be the diameter and face of the wood fiber wheel to drive the car 25 miles an hour, the engine running 800 to 1,000 r.p.m. Will the car run just as easy with a larger sprocket on the shaft and a smaller wood fiber wheel? I would like the correct proportions for these wheels. J. H. KINDIG.

Huntington, Ind.

We should advise making the friction wheel 18 inches in diameter and the driven wheel 12 inches in diameter by 1-2 inch face. The width of the latter naturally determines the number of speeds available with a friction wheel of a certain diameter. We should also make the forward sprockets on the countershaft, 12 teeth, instead of 9, leaving the rear sprockets as they are. This will give a 3 to 1 reduction on the chains. Assuming a motor speed of 1,000 r.p.m., and with the driven wheel on the countershaft placed 3 inches from the center of the friction disc, the car should have a speed of 13 to 13 1-2 miles per hour; moving the driven wheel out to a point 6 inches from the center should double this speed, causing the car to travel a little over 27 miles an hour, which, with the necessary losses through slippage, not taken into account in the above, should give the desired speed of about 25 miles per hour. The car will run easier with the larger sprocket, but the driven friction wheel cannot be made small, as it would run too fast and would slip more.

ADVANTAGES OF TWIN-CYLINDER CASTINGS.

Editor THE AUTOMOBILE:

[1,398].—I would like to ask a few questions concerning the construction of gasoline motors through "Letters Interesting and Instructive."

1. Why are there more four-cylinder engines (auto type) cast in pairs than separated? What are the advantages and disadvantages?

2. What advantage is claimed of a 3-bearing crankshaft (four-cylinder) over a 5-bearing type?

3. Are there any six-cylinder engines having cranks set at an angle of 60 degrees? M. H. MURPHY.

Powell, Texas.

1 and 2. The twin casting simplifies matters in a great many different ways, and accordingly reduces the cost of manufacture. There are only two castings to a motor, instead of four; with special machinery each pair of cylinders may be machined at once. It is easier to level and line up two large units on the crankcase than it is with four small ones. The engine as a whole may be made shorter and con-

sequently lighter. The three-bearing crankshaft is shorter, lighter and stronger for the same size motor; or, it may be made very much stronger by putting an extra amount of metal in the cheeks without increasing its weight beyond the point necessary in a five-bearing shaft. The expense of machining is considerably reduced in the three-bearing type; it is easier to align and the bearings themselves may be made larger. We do not know that it has any particular disadvantages not present in the five-bearing type.

3. We do not know of any, but if six-cylinder two-cycle engines were built this would be the logical crankshaft arrangement.

AN AUXILIARY AIR VALVE IS REQUIRED.

Editor THE AUTOMOBILE:

[1,399].—I have a (mixer) carbureter that I think is a little out of order. When the car is standing, the engine will run slow and speeds up all right—appears to—but when the car is running and I open the throttle she does not respond, but will miss. Can you help me out? The mixer has no auxiliary air valve for high speeds. The engine also knocks some when I open the throttle on a hill. The bearings are all O. K.

Warren, Mass.

LOWELL S. ELLIS.

Some means of supplying an additional quantity of air to compensate for the extra fuel drawn through the nozzle at higher motor speeds, is necessary in order to run a variable speed motor satisfactorily. Lack of this provision doubtless also accounts for the knock you speak of, as opening the throttle causes the mixer to supply a rich, slow-burning mixture which gives rise to considerable back pressure on the piston. That is, taking your assumption that the bearings are in good order, to be correct. An examination of the latter may reveal a condition that a casual inspection does not suffice to bring to light.

KNOCKING CAUSED BY SLOW-BURNING MIXTURE.

Editor THE AUTOMOBILE:

[1,400].—I have a 1908 Ford, model S; the valves are clean, pistons have no carbon, and connecting rod is tight, yet there is a dull knock somewhere. I find that when the knock is most prominent, if I adjust the needle valve—sometimes giving it more gas, other times less—the knock ceases and the car runs all right. The carbureter is a Kingston. Will you also tell me where there is anything like a carbureter knock? I have often heard this question discussed, but have had all kinds of answers.

SUBSCRIBER.

The noise you mention is often traceable to an improper mixture, and the fact that you can remedy matters by adjusting the needle valve would seem to indicate that this is the case in the present instance. Unless the mixture be approximately correct, *i. e.*, neither too thin nor too rich, combustion is delayed, and in a high-speed motor such as the Ford the valves do not remain open long enough to permit the burning gases to completely escape. The consequence is, there is still considerable pressure remaining in the cylinder after the exhaust valve closes, and the piston has to work against it. Carbureter popping is common, but we have never heard of a "carbureter knock."

WILL A CRANKSHAFT STAND THIS STRAIN?

Editor THE AUTOMOBILE:

[1,401].—Please inform me as to the relative strength or resisting power of a crankshaft, that is, which part is theoretically subjected to the greatest strain, and if theory and practice coincide? I want to know if the torsional strength of a crankshaft is great enough to allow of the cutting of a ball race on the mainshaft bearing, thereby reducing the diameter from, say, two inches to one and a half inches. Would it stand the strain?

Freehold, N. J.

W. H. PORTENS.

We should regard adopting such an expedient as the practical equivalent of ruining the crankshaft, as it would not be likely to have sufficient capacity to stand the strain very long, particularly as the reduction you speak of amounts to fully 25 per cent. The stresses on a crankshaft naturally increase, in the multi-cylinder motor toward the flywheel end, reaching their summation at the point where the flywheel is attached.

FORMULÆ OF VARIOUS AUTO FUELS.

Editor THE AUTOMOBILE:

[1,402].—Can you give me the formulas for alcohol, gasoline, benzol, benzine (if different than benzol), and kerosene? Will you also give me the formulas after each is mixed with air and burned when perfect combustion takes place? Or the formulas for each burning under atmospheric pressure? Also, if more perfect combustion could be gotten by having several pounds air pressure to mix with the vapor?

Have you the formula for the fuel oil used in large explosive engine and sold by Standard Oil?

H. J. EATON.

Nyaack, N. Y.

We regret that the inquiries contained in your letter involve a great deal more research to answer properly than we are able to devote to them. We would refer you to Clerk's and Sorel's works on the subject, the former being the English authority and the latter the French. It may be possible that some subscriber has this data in readily accessible form, and may be willing to supply it for the benefit of the inquirer. Nor do we know the S. O. product's formula, but think it is merely a low grade oil.

AVERAGE SPEEDS OF WINNERS IN BRIARCLIFF.

Editor THE AUTOMOBILE:

[1,403].—Kindly answer this question in "Letters Interesting and Instructive": What was the average speed of the winning car in the Briarcliff race, not counting controls? Different accounts of the race put the speed at from 46 to 49 m. p. h.

Oakdale, L. I.

H. T. CHITTENDEN.

Assuming the course to be 240 miles in length, not including the controls, the average speeds of the first seven to finish in the Briarcliff race were as given on page 598 of THE AUTOMOBILE of April 30. Strang's average, 46.15 miles per hour; Cedrino's, 44.44; Vaughan's Stearns, 43.95; Apperson, 42.24; Seymour's Simplex, 43.37, and Leland's Stearns, 42.85, the last two being unofficial, as the times were not recorded except unofficially. The Bianchi, the fifth car to finish officially, only averaged 40.40 miles per hour. On his best lap, Cedrino in the Fiat made the round at the rate of 49.25, the best Strang did being 47.30 miles per hour.

CHANGING FROM ELECTRIC TO GASOLINE.

Editor THE AUTOMOBILE:

[1,404].—I wish to change power of my Waverley electric to gasoline motor, and am advised you will furnish me with the addresses of firms manufacturing motors.

W. R. SANDERS.

Washington, D. C.

You will not find it advisable to make such a change as you propose, as it involves sufficient work to build a gasoline-driven car complete. Electrics are designed to run at slow speeds and they are very heavy for their size. They are made very high in order to permit of carrying the motors beneath the frame, and the wheelbase is very short—much too short for satisfactory service in a car capable of a speed of more than twenty miles an hour. You will find it much more economical to sell the electric car and invest in new materials. See our advertising columns.

AUTOIST'S EXPERIENCE WITH TIRE PROTECTORS.

Editor THE AUTOMOBILE:

[1,405].—In reply to letter No. 1,352 concerning internal tire protectors, I will give my brief experience. A friend thought he had the tire bogie (?) beaten with just such a band as Mr. Eisemann speaks of—steel discs carefully imbedded in a canvas and rubber belt. I put them in the front wheels (36x3 1-2) with new Michelin shoes and tube that had not gone fifty miles, and had covered about thirty miles when a tire blew out. When I examined it I found a slit wide enough for two fingers and one of the discs protruding. On removing the tube I found many of the discs had chopped out of the belt, and it would have been only a question of a few more miles before the whole tube would have been in shreds. I removed the other tube. It was in pretty bad shape, but not quite as far gone. The "protectors" had been carefully made and carefully inserted, so there were no rough edges to catch, but the action of the wheels had been too much for the tire protectors. The tubes were beyond repair.

H. C. CRESLY.

REEVES FINDS INDUSTRY IN EXCELLENT CONDITION

FULL time in almost all the factories and in many cases night work in special departments of some 25 factories in the West, is the news supplied by Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, following a two-weeks' visit to Western automobile cities.

"While one likes to view his own industry with eyes of optimism, my view of the Western situation was entirely without prejudice," says Mr. Reeves. "It is difficult for the average man to believe that the automobile business is in such splendid shape, whereas other lines of trade show a marked falling off. It indicates beyond argument the fact that the motor vehicle of to-day, while a luxury for a few, is a necessity for the many.

"At Newark, N. Y., the Mora people are in their new factory and working the full force turning out Mora cars. They have entered a car for the Vanderbilt Cup race. At Rochester, the Gearless people are working on a new 24-horsepower car of the small type to go with their 'Big Six' that was made famous by its work in escorting the round-the-world racers. At Buffalo both the Thomas and Pierce factories are keeping up with their reputation for building excellent cars of the larger type. Buffalo with its big club, is a veritable paradise for autoists. As an indication, I am told that the Rochester club will send 100 cars carrying members to the A. A. A. National Good Roads and Legislative Convention.

"No one denies that Michigan is the father State of automobile manufacture, and Detroit the 'Queen City.' The makers there report Eastern trade to have been a little slack for a couple of months during the Winter, but now coming with a rush. The trade in the West has been good for the past year. It is worth noting that in proportion to population, Iowa has led all other States in the purchase of automobiles during the past three months, according to the books of many makers. The Motorcar Company is working until 10 o'clock at night, turning out the friction-drive Cartercar. The Brush runabout people have their new models well under way and are shipping \$500 single-cylinder wagons every day. The Aerocar people are making big plans for 1909, and so are the DeLuxe. I enjoyed seeing the last 1908 Packard driven through the streets of Detroit.

"As might be expected, the Ford plant is a veritable beehive, turning out runabouts and the new 20-horsepower touring cars, which, by the way, will have the steering wheel on the left-hand side. It is a wonderful production and in keeping with the reputation of Henry Ford. The Wayne people are making great plans for next year, and I was told there were plans for a consolidation of the Northern and Wayne plants, with W. E. Metzger as sales manager. The Cadillac company continues to find an excellent market for their single-cylinder car, while the Thomas-Detroit Company are finding difficulty in getting out enough of

their cars to satisfy agents. Messrs. Chalmers, Coffin and Chapin showed me a new 24-horsepower car which they are getting under way very rapidly and it should be a great seller.

"At Jackson, Mich., the makers of the Jackson car have gone into a factory double the size of their old one; they have erected another factory for motors and also a drop-forging plant.

"No one denies that the Reo proposition is a leader in the automobile trade, and the factory at Lansing is the wonder of all who visit that city. While I expected a good deal, I was not prepared for the changes that have been made during the past six months. About 900 men are being worked, and Messrs. Olds and Peer opened the books and showed me where 803 Reos had been shipped in April.

"Another one of the regular manufacturers that is turning out cars in large quantities is the Maxwell-Briscoe Motor Company, whose big plant in Newcastle, Ind., is now in full swing. The greatest difficulty in Newcastle has been to build homes enough for the workmen who came there for the new enterprise. At Anderson, Mr. Louderback told me they were 168 cars behind in orders for the Lambert friction-drive machine.

"Indianapolis is another leading city for automobile manufacture. The American will continue their underslung racy runabout, while the Marion is devoting its factory to a similar type of car. The Nordyke & Marmon company are meeting with great success in their new air-cooled machine, and Howard Marmon, the designer, told me of some sensational plans for next year. The National as one of the leaders in the big car trade, has had its usual steady business, and so has the Premier. Its work laying out the Glidden tour has brought a lot of attention to the Premier car, and on Monday last they began another test that should attract a lot of attention. It is an attempt to travel a century a day for 100 days, or 10,000 miles in all, to prove the reliability of the auto and its low cost of upkeep. The Overland people have outgrown their factory and are assembling cars and doing a lot of general work in circus tents.

"At Pontiac, Mich., the Rapid Motor Vehicle Company have been snowed under with orders for commercial cars. They are the acknowledged leaders in commercial car manufacture, their products being on the streets of almost every prominent city. The Welch Brothers, notwithstanding the rushing orders of agents, are turning out their cars just as carefully as ever. They are built like a watch. I do not know of any factory in the West where more care is given to each car than in the production of the Welch. A. P. Brush, the designer of the Cadillac, is now at Pontiac, associated with Edward M. Murphy, in the Oakland Motor Car Company, producing a car with two vertical cylinders. The unique method of balancing the motor makes it run almost as smooth as any four-cylinder."

AS BRISCOE LOOKS AT THE TREND OF DEMAND AND MAKING

"WITH the season of 1908 began what Darwin would characterize the process of 'reversion to type' in automobiles—to lower powered cars," says Benj. Briscoe. "The fad for excessive power has about run its course, and I believe we have seen the last of the road-racing monster. If other signs were lacking, the mere fact that practically every maker of moderate powered cars is oversold would prove this contention. For our own part we won't have a car left in four weeks from to-day, notwithstanding we built 50 per cent. more Maxwells this year than ever before.

"And it isn't all a matter of price either. I can't see that the recent business depression has had any serious effect on the trade; of course many makers reduced their output in the early days of the panic, but even had they built as many as they orig-

inally planned, they still would have sold all they made of moderate-priced cars. Fact is it took a few years to demonstrate to users that the first cost of a car is not the chief item.

"While the user has been learning his lesson in maintenance cost, designers have been refining and simplifying till the 24-horsepower car of to-day is more efficient than the 60 of two years ago. Of course, being less than half the weight—one-third in many cases—it is more economical of fuel, tires and up-keep generally. In the 60-horsepower roadster type of car we have seen high tide in the craze for power and speed. The ebb has now set in and there will be a steady return to sanity, to moderate-powered, light-weight, low-priced cars capable of lawful (which is to say enjoyable) speeds, and evidences of the general trend are to be seen on every hand at the present moment.

CONSISTENT adherence to features that have been tried out in past models of the same car, rather than radical departures of any nature, characterize the Grout for 1908. The makers—the Grout Automobile Company, Orange, Mass.—have not as yet gone in for building their own motors, but still stick to the Rutenber. This is a four-cylinder, four-cycle type, the dimensions of which are 4 1-2-inch bore by 5-inch stroke, and it is designed to develop its rated output of 35-horsepower at a moderate normal speed. It has given such satisfactory service in the Grout cars turned out in the past that the makers have found no occasion to change. The cylinders are independently cast units with the valve chambers on the left hand side, the inlet and exhaust manifold folds being held in place by common yokes, thus making them easily detachable. The use of separately cast cylinders calls for a five-bearing crank-shaft and the builders of the motor have made unusually liberal provision in this respect, the five bearings totaling 11 inches.

The connecting rods are of the marine type and are made of one-piece drop-forgings of open hearth steel, while the piston pins are also of a special grade of steel and are made of large diameter. The valves are likewise one-piece drop-forgings, while the valve lifts are made adjustable and interchangeable. Drop-forgings are also employed for the timing gears, which are completely enclosed in the aluminum alloy crankcase and run in oil constantly, thus tending to make the motor very silent-running. The cams are made integral with the camshaft and are ground accurately to contour. The pump is of the standard gear type, and is made entirely of bronze, with the exception of the shafts, which are of steel. Every part of the motor is made interchangeable to facilitate replacements and particular attention has been paid to simplifying it to a point where no great amount of experience is required to dismantle or re-assemble its working parts. An instance of this is to be found in the manifolds, mention of which has already been made. Both the inlet and exhaust piping can be entirely removed by loosening four nuts, the motor being distinguished in

this respect by a construction which entirely eliminates the use of gaskets in the joints between the piping and the cylinders.

The synchronous type of high-tension ignition is employed, using a single induction coil mounted on the dash. This simplifies this extremely important essential of the motor to a very great extent, there being but a single coil and vibrator to adjust; while once running satisfactorily, the intensity and timing of the spark are exactly the same in the case of each one of the cylinders. The distributor employed for effecting this is a special type, exclusive with these makers, and consists of a timing device supported at each end by a bronze cap forming a bearing at the top and bottom for the central shaft. There are no frictional surfaces in the secondary member of the distributor, thus eliminating the creation of fine particles of metal, which cause trouble by sticking to the surfaces between the connections and cause short circuits. The entire distributor remains stationary, so that all the wiring is firmly fastened in place, avoiding the tendency to derangement caused by the constant movement of the timer to advance or retard the occurrence of the spark. This is avoided by accomplishing the spark advance through the medium of a sleeve with a spiral slot cut in it and which advances the shaft in the timer ahead of the driving shaft.

It has been developed to a point where it has been found that the motor can be run satisfactorily for long distances without the coil vibrator needing adjustment, and without suffering any damage in the way of burning at the contact points. A much greater mileage is also possible with a single charge of battery.

The essential of lubrication is taken care of by a force-feed oiler located under the bonnet on the right-hand side of the motor and forward, where the oil is kept at a uniform temperature when running. This is an advantage, particularly in cold weather, and it is a feature the adoption of which has been noticeable on a great many of the best-known American cars during the past few years, it no longer being the policy of the best designers to encumber the dash with fittings that are not absolutely needed there.

Showing Crankcase Breathers and Oiler, Grout Motor.

Grout Synchronous High Tension Distributor Showing Advance.

The builders of the Grout are one of the few American concerns that still adhere to the armored wood type of frame, a steel subframe being employed to carry both the motor and gear set. The wheels are of the artillery type running on double ball-bearings, the inside having 10 7-8-inch balls, while the outer bearings carry the same number of 3-4-inch balls. Axles are both single-piece forgings

sis, a seamless pressed steel tank of cylindrical section is employed as a fuel container. This is mounted about midway the length of the chassis so as to come under the front seats and is designed to feed to the carburetor by gravity, its location with regard to the latter being such that the feed is not disturbed by any angle which the car can assume on a grade. It has a capacity of 14 gallons. Control is by means of the usual spark and throttle levers mounted on a stationary sector placed over the steering wheel. Two models are being listed for 1908, the regulation Grout touring car and the Grout four-seated tour-about, an illustration of which is given here.

FRONT DRIVING OF AUTOMOBILES.

Several interesting papers have been read recently before the Institution of Mechanical Engineers (London) on the subject of front driving as applied to electric, steam and petrol vehicles. The main advantage of the front-wheel drive undoubtedly exists in the fact that the dangers of side-slip are reduced to a minimum. A long, narrow, rectangular block of metal, when moved over a raised surface by imposing a single force pushing at its back, is quite uncontrollable as regards the direction it takes. In this case the surface, reacting on the imposed force frictionally, has a greater effect upon the movements of the metal block than the applied force itself. In short, by applying power to the

back of the block, behind the center of gravity, the movements of the block must be erratic. On the contrary, if the block of metal be pulled from the front over the same surface, a straight course is perfectly feasible. In dealing with sharp turns there is not much to choose between pulling and pushing. There is no doubt, however, that for traffic purposes, the front-driven car is much to be commended. Corners are not taken at high speeds in towns, and in every other respect the stability of this type of car on the most greasy surface is unquestionable.

Dr. Hele-Shaw related some very interesting facts dealing with experiments which had been carried out by the Krieger Company at their garage in Gillingham street. It appears that a surface composed of soft soap was prepared, and two electric cars, front and rear driven, were tested on this surface, proving beyond question that the non-skidding properties of the front-driven type were extraordinary. Granted an efficient transmission and correct distribution of weight, the front drive, as applied to public service vehicles, should meet with undoubted success on pleasure vehicles, as well as for commercial use.

For steering, a gear of the worm type is employed, the wheel being a one-piece bronze spider, on which is mounted the wood rim. Spring connections are provided to take up all shock and jar in the steering gear and provision is made for adjustment in the shape of cone bolts used in the connections, so that any back can be immediately corrected. The wheelbase is 115 inches and the tire equipment is of the clincher type, purchasers being given an option on any standard make of tires. As will be apparent from the accompanying illustration of the complete chas-

sis, a seamless pressed steel tank of cylindrical section is employed as a fuel container. This is mounted about midway the length of the chassis so as to come under the front seats and is designed to feed to the carburetor by gravity, its location with regard to the latter being such that the feed is not disturbed by any angle which the car can assume on a grade. It has a capacity of 14 gallons. Control is by means of the usual spark and throttle levers mounted on a stationary sector placed over the steering wheel. Two models are being listed for 1908, the regulation Grout touring car and the Grout four-seated tour-about, an illustration of which is given here.

Plan View of Grout Chassis for 1908, Illustrating Convenient Arrangement of Essentials.

Veteran Duryea's Latest Type of Buggy Auto.

DETAILS OF NEW DURYEYEA "BUGGYAUT."

After seventeen years' experience in building automobiles, Charles E. Duryea, who can well lay claim to being the dean of the profession in this country, has returned to his first love, so to speak, by bringing out a buggy type of automobile with the euphonious title of the "Buggyaut." Although this is really a return to the first principles in many ways, Mr. Duryea's first productions were of the high-wheel type of "horseless carriage," it also embodies a number of radical departures from its first prototype of the early '90's. An air-cooled, two-cylinder, two-cycle motor has been adopted as the power plant, the cylinders being placed almost horizontally under the rear of the body and just slightly forward of the rear axle. The cylinders face forward and are cooled by integrally cast flanges, the flywheel being placed between them. To increase the cooling effect, the motor is inclined at an angle of 15 degrees from the horizontal, and with its two 3 3-4 by 3 3-4-inch cylinders, it is rated at 10-12 horsepower.

A separate muffler is fitted to each cylinder, and as they are large in size and efficient in action, the result is a very quiet-running buggy. The entire power plant is supported on a three-point suspension, and drives by means of extensions of the crankshaft of the motor and small grooved pulleys to large internally grooved rings bolted to the inner faces of the driving wheels. In fact, the method of transmitting the power is one of the most distinctive features of the car. The method is an old one in machine shop practice, having become familiar through long usage on tumbling barrels in foundries, hoisting drums and the like, though for that matter Mr. Duryea states that there is not a single new thing on the car, everything involved in its construction having been thoroughly tried out by usage in other fields.

The driving wheels are mounted directly on a dead axle of square section steel and a differential is dispensed with. To obtain the compensating action of a balance gear, an eccentric is fitted to the steering post. When the latter is turned to send the car round a corner, this eccentric shifts the point of the subframe to the inner side while rounding the corner, thus releasing the inner grooved roller from engagement and permitting the outer wheel alone to drive. These grooved rollers are of hardened steel, while the large driving rings are of soft iron, thus giving a good coefficient of friction and minimizing the wear, owing to the ample surface presented. The whole power plant is strongly trussed, binding it together as a solid unit with a three-point type of suspension.

Ignition is of the high-tension type, by means of coil and batteries, the timer and distributor being located in the flywheel of the motor. Another distinctive feature of the latter is the means of starting, which is accomplished from the seat by

means of a pull-up handle connecting with the flywheel by means of a cable. Pulling the handle quickly as far as it will come serves to turn the motor over several times, and the operation may be repeated as often as desired, by merely letting the device resume its normal position after each trial.

The wheels are 36 inches in front and 42 inches in the rear, and are shod with 1 1-4-inch solid tires. The forward axle is a 1-inch I-beam, while the rear is a 1 1-4-inch square axle, the wheels running on ball-bearings. The wheelbase is 80 inches, and the tread standard, though the latter will be varied to order. Steering is by cross-lever and post supported on side bar, the steering pivots being inclined and all points made adjustable. The brakes consist of grooved iron shoes making engagement with the driving rings. They are operated by a pedal, and the latter, together with the change pedal, located at the rear of the footboard instead of forward, as customary, constitute the only pedals employed. The car is usually designed to make a maximum speed of 20 miles an hour, though this may be varied by altering the size of the grooved rollers. The weight, all on, is 850 pounds, 60 per cent. of which comes on the rear wheels. The body equipment is of the regular buggy type, as will be apparent from the accompanying photograph, although a jump seat in the rear is also provided, the price with this equipment being \$750. Full elliptic springs fore and aft are employed and they have been made of ample size to carry the weight. It will be noted that the specifications of the car meet the ideas of many who wish to see a two-cycle, friction-driven combination.

NEW MODEL ADDED TO THE MOON LINE.

What may be most appropriately termed a between seasons' model has just been added to its line by the Moon Motor Car Company, St. Louis, Mo. It is officially known as "Model D," and is a seven-passenger car on a 121-inch wheelbase. The construction and design throughout follow the same standards as those which characterize the Moon product this year. The neat and attractive lines of the new model are strikingly apparent in the head-on view presented by the accompanying photograph.

Head-on View of Moon Model D.

Specially Designed Berliet for Long Distance Tour.

BERLIET SPECIAL THREE SEATER FOR TOURING.

Runabouts are not generally looked upon as the ideal type of car for a long tour, although what has come to be known as the "touring runabout" has come into vogue within the past two years and has become deservedly popular, owing to its light weight as compared with the regulation type of touring car, as well as the greater ease with which it can be handled. S. L. Schoonmaker, well-known through his connection with the steel industry, has just designed a special body for this type of car. It is intended for the accommodation of himself and Mrs. Schoonmaker, and will be used on a tour of Europe. This special body has been designed for an American Locomotive Auto Company's standard 40-horsepower chassis, on which it is shown mounted in the accompanying photograph. One of its most striking features only becomes apparent upon a little investigation, and that is the unusual amount of storage room provided, as well as the ingenious type of hood that has been designed for the forward seats. There are large drawers under these seats, while under the rumble is a capacious storage box, and yet there is room enough for a trunk back of the rumble seat, without the necessity of employing a trunk rack. It should be an ideal two-person touring outfit.

PEERLESS BRINGS OUT CLOSE-COUPLED SIX.

Body design would appear to be much the same regardless of the type of car, and even the owner of the big six-cylinder who has power and to spare is not overanxious to tote around with him any more weight in the shape of a body than is actually necessary to accommodate the number he had in view when becoming the owner of the machine. This probably accounts for the Peerless "close-coupled" six-cylinder car shown in the accompanying illustration and which recently became the property of a prominent resident of Akron, O., the "tire city." The use of this type of body on a large car has the great advantage of bringing its entire seating capacity well between the axles and quite a distance forward of the rear axle, which contributes very largely to the comfort of the passengers in the tonneau. This is also possible without giving the car an unusually long wheelbase.

"Close Coupled" Body on a Peerless Six-cylinder.

FEATURES OF THE CLARK STEAMER FOR 1908.

In numerous ways the Clark steamer is distinguished from others of its class in the steam field, although, as will be seen from the accompanying illustration, its external appearance has been made to conform to that of the standard type of car, whether its power be steam or gasoline. The Clark has been on the market for several years and is manufactured by Edward S. Clark, 242 Freeport street, Boston, Mass. The power-plant consists of a four-cylinder opposed, horizontal, high-pressure steam engine located transversely underneath the frame, so that all valves and other parts are very accessible. All the working parts of the engine are thoroughly protected against the dust and dirt of the road. Lubrication is positive and plentiful, and with the large bearing surfaces provided wear is reduced to a minimum and but little attention is required under ordinary running conditions.

Owing to the high temperature at which the superheated steam is used, poppet valves are employed, a great advantage of this type being found in the fact that where the cylinder becomes

Four-seated Runabout Type of Clark Steamer for 1908.

flooded through carelessness or otherwise, the valves will be lifted from their seats, thus protecting the working parts of the engine from damage. Valve operation is exactly the same as on a gasoline motor, the camshaft and its cams being designed to give all changes of cut-off and reverse, and insuring better economy of fuel than is possible with the slide valve. The generator, which is of the flash type, is placed forward under the hood, while just forward of it is the condenser, in the same location as the radiator of a gasoline car, this arrangement being original with the Clark.

All changes of speed are controlled by the throttle, which is placed above the steering wheel, while the adjustment of the combined fuel and water pump is controlled by a wheel placed below the steering wheel. This allows the operator to make all necessary changes in the amount of water fed to the boiler, in order to meet varying conditions of roads and grades, the generator only making steam as fast as it is used. The adjustable water pump is placed on the footboard, where it is easily accessible, and the valves can be readily removed. The pump plungers have a varying stroke ranging from zero to full capacity, but all the fuel and water are displaced from the body of the pump every time, preventing air from accumulating there and deranging it. The varying stroke of the pump is effected by moving a block on a quadrant operated by a worm, the position of which is easily controlled by the hand wheel on the steering column. The steering wheel can be thrown into a vertical position, thus locking the throttle valve and making the seat more accessible.

Two change-speed gears running on Hess-Bright ball-bearings are provided, the pinions being of chrome nickel steel, a bevel gear drive by propeller shaft connecting the engine and rear axle. The wheelbase is 110 inches, and the tread standard, while the tire equipment consists of 36 by 4-inch tires on all four wheels. The tonneau is large and roomy and the car will carry seven. It lists at \$3,500, while a roadster model with either two or four-seated body lists at \$2,500.

PREVENTS UNAUTHORIZED USE OF A CAR.

One of the earliest abuses that sprung up in connection with the keeping of automobiles in garages has been their unauthorized use by the chauffeur, and it is safe to say that this abuse is still very frequent to-day, and is, moreover, responsible for a very large percentage of the accidents that happen. In fact, it is safe to say that a majority of the automobile disasters have happened in cases where the chauffeur has had the car out surreptitiously with a few friends of his own choosing, before

Time Recording System Designed for Garage Use.

whom he found it necessary to indulge in reckless driving. The result is that the car owner is given considerable undesirable publicity in the newspapers, beside which he has to foot the repair bill and the garage keeper has an unpleasant quarter of an hour explaining why the car was out.

To avoid such a state of affairs, numerous systems of checking the movements of cars in a garage have been devised, but with few exceptions they have been found lacking in one respect or another. To overcome such faults, the International Time Recording Company, Endicott, N. Y., has perfected a system whereby a car cannot be taken out of the garage without an automatic record of the exact time being recorded. An International card recorder is placed in the most convenient location overlooking the exit and entrance, while alongside it, two card racks, numbered from 1 to 200, are placed, respectively labeled "In" and "Out." Cards with from 6 to 18 registration columns for each day are placed in the "In" rack, each car being given a recorder number. When all the cars are in the garage, all the cards are in their respective pockets on the "In" rack.

Whenever a driver presents an order to take a car out, the foreman of the garage receives the order, and when the car comes to the exit, the numbered card of the automobile is taken from its rack, the time recorded in an "Out" column, and the card placed in the "Out" rack by someone authorized to allow cars to go out. On its return, its time is recorded in an "In" column, and the card transferred to that rack, a copy of this record being furnished the owner each week so that he knows exactly when his car has been taken out of the garage and when it has been returned. In the garage itself a glance at the rack shows at once exactly what cars are in or out.

Many of the large garages in cities have installed this system of checking cars, and in addition use an International card recorder to register

the arrival and departure of employees and to record the exact amount of time spent on repair jobs, this latter system being a great preventive of disputes over the time expended on this work. Each man is given a job card when he begins work on a car, and he rings "In" the moment he begins work, and "Out" when he finishes. The card is a voucher of the time spent and is also a guarantee to the garage keeper that the time was actually put in on that job, for as soon as one is ended the mechanic must report to the foreman for work on the next, and if there be nothing ready the repairman is given a card marked "waiting time," this card being used in the same manner as the others. This feature of the system forces the foreman to plan his work ahead so there will be as few "waiting time" cards as possible.

This garage card recorder system has proved its worth on numerous occasions by showing that a car was in the garage, when its owner has been accused of having been the cause of some serious accident, or other offense. Its chief value naturally lies in the check it keeps on the owner's employee so that the latter cannot use the car at night.

STUDEBAKER GASOLINE-DRIVEN AMBULANCE.

One of the first gasoline-driven ambulances to be used in this part of the country has just been delivered to the Kings County Hospital, Brooklyn, by the New York branch of the Studebaker Company. It is built on the standard Studebaker 30-35-horsepower chassis, with a 136-inch wheelbase, and represents a new type, of which several are now under construction for hospital use. Four collapsible berths are provided, so arranged that they can be folded up out of the way when not in use. Access to the interior is gained both from the rear and from the side, just behind the driver's seat. The smooth and quiet running of the gasoline motor and the great ease with which it can be controlled, as well as its far greater speed and unlimited radius of action make the gasoline ambulance far superior to the electric for emergency service, and the wonder is that its unlimited possibilities in this direction have not been realized much sooner than has been the case, for next to getting to fires promptly there is nothing in which speed is so often a matter of life and death as the numerous calls for an ambulance which are a daily part of life in every large center of population. The panting and galloping horse with the clanging wagon behind him is a familiar sight in every city, and the fuss he makes in covering the ground gives an impression of great speed, but the manner in which runabouts and touring cars on pleasure bent swiftly glide by and still keep within the legal speed limit shows more plainly than words that the ambulance horse's speed is as much vertical as it is horizontal, which accounts for the poor progress made.

New Studebaker Ambulance Put Into Service by the Kings County Hospital.

A Charming Quintette of Stevens-Duryea Girls.

The ladies of the office force of the Stevens-Duryea Company, of Chicopee Falls, Mass., occasionally take a little time from their office duties and enjoy the pleasures of a short trip in a Light Six Model U Stevens-Duryea Touring Car. The illustration shows them returning from one of the runs.

EFFICIENCY OF THE "BLUE BOOKS."

Every year these "Blue Books" demonstrate more and more ingenuity in construction and draughtsmanship. Especially is this the case with the general maps of the New England issue, placed rightly, at the very beginning of the volume.

Every city which is the center of a section is identified by a number within a circle, which corresponds to the page on which the information relating to all the routes radiating from that city is to be found, while intermediate and terminal points are taken further care of in the general index; and a new and original feature has been added in special diagrams, showing the entrances to and exits from all the principal places.

It might be thought that this multiplicity of directions and minute details would tend toward confusion, but it does not. Its interpretation indeed may, when en route, be left to any member of the party, down to the youngest capable of reading, and, furthermore, it is a bound book, and not a book just glued together at the back. It will, with moderate protection from the rain, stand the wear and tear of a long season.

It will no doubt interest users of the present "Blue Books" to know that the publishers have in preparation an additional volume (No. 4), covering the main-traveled automobile routes in the Middle West. Broadly speaking, the new work will deal with the important territory between Cleveland, Toledo, Chicago and Milwaukee on the north and the Ohio River on the south, with various extension and connecting routes.

A. Y. Bartholomew in His Glide, and His Bride-Elect.

Mr. Bartholomew, who is vice-president of the Bartholomew Company, of Peoria, Ill., is at the wheel, and sitting beside him is his fiancée, Miss Lucy Hubinger, of Peoria. The happy event is to occur in the middle of the summer. The bridegroom-elect is the son of J. B. Bartholomew, president of the company.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
- Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
- January, 1909.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
- February, 1909.....—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Races, Hill-Climbs, Etc.

- June 5.....—Jamaica, L. I., Straightaway Time Trials, Long Island Subway Celebration Committee, Assisted by Long Island Automobile Club.
- June 6.....—Worcester, Mass., Dead Horee Hill Climb, Worcester Automobile Club.
- June 9.....—New York City, Orphans' Day, Committee of Fifty of the Local Trade.
- June 10.....—Baltimore, Orphans' Day Automobile Outing, Automobile Club of Maryland.
- June 13.....—Hartford, Conn., Orphan's Day, Automobile Club of Hartford.
- June 17.....—Buffalo, N. Y., Orphans' Day, Automobile Club of Buffalo.
- June 24-27.....—New York and Philadelphia, Double-Head Endurance Run to Delaware Water Gap, under the auspices of the "Public Ledger" of Philadelphia.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- June 27.....—Norristown, Pa., Skippack Hill Climb, Norristown Automobile Club.
- July 4.....—Lowell, Mass., 250-mile Road Race, Lowell Automobile Club.
- July 4.....—Wildwood-by-the-Sea, N. J., Annual Speed Tournament, Motor Club of Wildwood.
- July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
- July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
- Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.
- October.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.

FOREIGN.

Shows.

- October 11-18.....—Paris, International Congress and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.
- December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill-Climbs, Etc.

- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
- June 14.....—Mount Cenis Hill Climb, for Voltorettes.
- June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial A. C.
- June 15-19.....—Scotland, Annual Scottish Reliability Trials.
- July 6.....—Volturette Grand Prix, Dieppe Circuit (Automobile Club of France.)
- July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- Aug. 12.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
- Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
- Sept. 1-8.....—French Volturette Contest, Aueplces "L'Auto."
- Sept. 6.....—Bologna, Italy, Florio Cup Race, Automobile Club of Bologna.
- Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

PUBLIC UTILITY OF HIGH-ROAD TRAINS ON FRENCH HIGHWAYS

THE following information concerning the running of passenger and freight trains on the highways of France is furnished by Consul-General Robert P. Skinner, of Marseilles:

There recently passed this consulate a "Train Renard," composed of a locomotive, two passenger cars, and one baggage car, which had just arrived from Paris under its own power and over the ordinary roads, thus supplying to the public a demonstration of its own efficiency. The trains mentioned are composed of elements, each receiving the energy of a vehicle called the locomotor, which being placed at the head of the train distributes the necessary power to the following elements by means of a transmission shaft extending from one end of the train to the other, thus enabling each car to utilize its own adhesion to the road surface as a means of advancement.

The locomotor—that is to say, the creator of the energy—is therefore lighter than any of the cars. Trains of this type completely loaded are able to maintain a speed of 21 kilometers (13.05 miles) per hour in case of passenger trains on levels and of from 15 to 16 kilometers (9.32 to 9.94 miles) per hour in the case of freight trains. It is said that freight trains of this type are able to maintain an average of from 10 to 12 kilometers (6.21 to 7.45 miles), fully loaded, in any kind of country.

It would be useless to enter into further details regarding

these high-road trains, as far as the United States is concerned, inasmuch as we are without a road system sufficiently advanced to make their application possible. On the other hand, the adoption of passenger and freight trains over railless roads in France has become not only a possibility but a fact. Already hundreds of inaccessible hamlets hitherto served by slow-going diligences, are kept in constant contact with the outside world by means of large auto-omnibuses, moving at an average rate of 15 miles an hour, transporting both passengers and express parcels; and now, following this development, comes the explosive engine motor, drawing full trains of cars, which it is claimed can be operated on level or mountainous roads at an exceedingly moderate expense. In other words, if all that is claimed for these trains is realized, it will be possible to give 25,000 communes in France, which do not at present enjoy railroad facilities, approximately the same advantages with respect to transportation as the more populous and highly favored centers.

This illustrates how much the creation of a better highway system would benefit the rural populations of the United States, who are at a great disadvantage in regard to transportation as compared with foreign communities, and deprived of the various kinds of satisfaction resulting from the existence of modern highways.

THE WORLD'S AUTOMOBILE TRADING ACCOUNT WITH FRANCE

PARIS, May 25.—Though the total exports for January, February, March, and April of the present year are lower than the corresponding periods of 1907 and 1906, there has been a sufficient increase during the past month to give ground to the belief that 1908, as a whole, will not be such a slack year as was expected some time ago. With the total automobile exports for the first four months of 1908 standing at \$8,376,400, the deficit on the same period of 1906 is only \$863,200. Compared with 1907 the deficit is \$2,011,200, the figures for the first four months of 1906-7-8 being: \$9,239,600, \$10,387,600 and \$8,376,400. These figures include automobile exports only, motorcycles and their parts being classified separately.

The United States, Russia, Algeria, Turkey and Spain are the only countries having increased their trading account with France during the first four months of the current year. England, the best customer, has taken automobiles to the value of \$118,000 during the month of April alone, bringing the total up to \$3,782,000 for the first four months of the year, this amount being a trifle higher than that of 1906. Nine other countries have cut down their automobile trading accounts with France.

During these four initial months the United States has taken in French cars to the value of \$846,800, an amount which is higher than both 1906 and 1907. The trading account per nation, as shown by the Government returns is as follows:

French Automobile Exports for First Four Months of 1906-7-8.

Country	1906	1907	1908
Great Britain.....	\$3,722,000	\$4,687,600	\$3,782,000
United States.....	819,400	789,000	846,800
Germany.....	1,335,800	1,001,200	723,200
Belgium.....	1,066,000	1,056,600	624,200
Algeria.....	245,000	257,400	357,600
Argentine Republic....	533,200	609,200	299,600
Spain.....	116,800	150,000	242,200
Russia.....	78,600	65,600	226,000
Brazil.....	52,400	342,400	163,600
Italy.....	633,600	339,400	147,400
Switzerland.....	174,000	299,600	107,800
Turkey.....	22,600	10,800	41,600
Austria.....	35,600	45,200	19,800

Of the four nations sending automobiles into France, England alone has increased her trade during the four months under review, the amount having risen from \$18,000 in 1907 to \$21,200 during the first four months of 1908. America's trade dropped from \$7,800 to \$3,800; Germany's business shows a drop from \$180,000 to \$149,400.

FRANCE PROMINENT IN MOSCOW SHOW.

Moscow, May 20.—A religious ceremony, followed by an elegant luncheon, marked the opening of the Moscow automobile show, presided over by the Military Governor of the city and assisted by the consuls of America, England, France, Germany, and other European countries. France believes there is good business to be done with Russia, now that the effects of the war are practically over, and has made every effort to be first in the new field. She has so well succeeded that French cars occupy almost all the stands, the only exception being Fiat, from Italy, Germain and Pipe from Belgium, Mercedes from Germany, and Humber from England. Touring cars, as well as commercial vehicles, are shown and are attracting attention. American firms, though having previously done business with Russia, are not represented at the exhibition.

INCREASE OF TAXICABS IN LONDON.

Consul-General Robert J. Wynne reports that taxicabs have become such popular street vehicles in London that the demand for them is much greater than the supply. He adds:

"The taxicabs are used by all classes of people, day and night, at the uniform rate of 16 cents a mile, and they represent a most attractive appearance in chocolate, blue, yellow, red and green hues, with chauffeurs in the brightest and smartest liveries. Although scarcely a year has passed since these swift-moving electric and petrol carriages appeared, the capital already invested in London taxicabs is \$10,000,000. There are 758 taxicabs on the streets, 2,600 taxicabs on order, 1,700 licensed drivers, an average of 55 certificates granted each week. There are eight London taxicab companies, their average day's takings of a taxicab being \$11.20.

THEN, LET'S HAVE AN AMERICAN RACE.

When one applies the uncompromising rules of logic he is unable to supply reasons why the automobile manufacturers of the United States, who consider racing a commensurate advertisement for the money expended, have not the same right as the European makers to decide as to what rules shall govern them in so doing.

When the American maker goes abroad to race he always has accepted as a part of the contract the existing foreign regulations, even when it has cost him considerable expense and effort to comply therewith. Until this year of our Lord 1908 the racing visitors to this side of the ocean have been subjected to no greater inconvenience than the voyage itself.

But this year for the classic Vanderbilt Cup race the committee having the event in charge, and containing representatives of the American manufacturers, have had the temerity to establish rules which do not this time coincide exactly with the foreign regulations which annually receive an overhauling. It is even known that the American committee took into consideration the fact that certain prominent American makers had gone to no small outlay in preparing for a 1907 race, which did not take place because a properly guarded course could not be secured and Mr. Vanderbilt and his associates were averse to repeating the experiences of 1906, marred by one fatality and scores of narrow escapes of various kinds.

It was then that the Long Island Motor Parkway was

born, and its dedication will be the 1908 Vanderbilt race, the rules for which say that every part of a car must be manufactured in the country from which it is entered. Furthermore, a maker is told that his car must weigh at least so much—thus preventing skeleton construction—and is also informed that it must not weigh more than a certain figure—thus barring monster road locomotives. Surely these ideas are not so very reprehensible, even from an engineering standpoint.

And, now, just a few words about the international rules, so called—though it would not seem that they are entirely international when the country making more automobiles than any two European countries combined had nothing to say in their adoption. In the first place, nothing is said about the entire car being made in the country from which it is entered, which would appear to be the first requisite of an industrial competition—and that is exactly what automobile racing has become. Granted that it is only just that the race governing body of a country should take into reckoning the wishes of the home makers, certainly this is thoroughly done in France, where its club turns racing over to a committee which is dominated by the makers, and one of them is even the chairman. Please keep this in mind when passing upon the merits of the French objections to the 1908 Vanderbilt conditions; also connect with the British kick the fact that that country has never had a car in the American race, and at the same time it might be well to recollect that the leading British firm—Napier, to be specific—is not taking part in the French Grand Prix because it does not like the rules.

These rules say that a car must weigh at least so much, and the figures are identical with the Vanderbilt minimum weight. But instead of establishing a maximum weight, the rules limit the amount of piston displacement; last year the fuel was the limit used to prevent the building of abnormal cars. Despite the fact that the piston displacement is limited, four-fifths of the cars in the Grand Prix exceeded 100 horsepower, and it is safe to predict that measured by the same dynamometer the top horsepower of the Vanderbilt list will not exceed the most powerful Grand Prix car. In the opinion of the experts, 100 horsepower is sufficient to travel at the greatest possible speed on any highway that now exists. But the Europeans, mayhap fearful of defeat, say that they will not compete in the Vanderbilt race unless the rules coincide; nor will they relieve their fears by substituting another engine with greater piston area, though they have months in which to do so. In other words, you must play always according to their rules, or it will be a case of getting into another yard—if one is supplied. Therein comes the other part of the story.

At Chicago, in March, 1902, the American Automobile Association was formed. The following year, in the club book of the Automobile Club of America, there appeared the following:

The American Automobile Association, embracing in its membership the principal automobile clubs of the United States, was formed in March, 1902, one of its functions being to regulate and control automobile racing in the United States.

All authorized race meets in the United States are now held upon sanction from and under the racing rules of that association, of which the Automobile Club of America is a member.

In view of the fact that the A. C. A. "corresponded" with the foreign clubs previous to the organization of the A. A. A., that arrangement was not disturbed, and pos-

sibly might have continued indefinitely if recent events had not transpired. It is pertinent to know, however, that no authority has ever been invested in the A. C. A. by the A. A. A., whereby the club could obligate the national body in international affairs. The club acted as "correspondent"; there its function ended.

And it would appear that occasionally its manner of transmitting this correspondence was open to the charge of neglect, for at such an important affair as the Ostend meeting, in July last, no delegate from the club attended, and consequently did not participate in the discussion of the much-referred-to racing rules. It is a fact of record that the secretary of the A. C. A. did send to the secretary of the A. A. A., in September last, a copy of the rules which had been adopted at Ostend, but unaccompanied by any comment whatever. There was no reference to any assumption on the part of the A. C. A. that it considered the A. A. A. holden to the acceptance of the rules, and certainly there could not have been any assumption of authority on the part of the club to bind the American race-controlling body, for the particular reason that the club did not even have a delegate present. At a subsequent session of the international gathering in Paris the club delegate did attend, and now states that he accepted the rules in behalf of the club, though the club never sent any notification to this same effect to the A. A. A., nor did the examination of its records betray any evidence that any such authority had been assumed.

But the impression has existed in Europe, apparently, owing to the similarity of names, that the club was the "whole thing," and that it even conducted the Vanderbilt race. Thus the confusion of the situation by the foreign clubs, which, for the present purposes of the A. C. A., is contorted into a demand that the club supply the foreign makers with a race under the so-called international rules. True it is that these same foreign clubs have practically

ignored the Vanderbilt race in recent years, the French club after its killing of the Gordon-Bennett declining to assist in the selection of a team from that country. And one can accept the statement that what the French club says is as good as the verdict that will be agreed upon ultimately, even though slightly modified.

Then we reach that part of the story where it is necessary to ask as to where the American manufacturer gets off in the premises. It would seem a plain matter of common sense and justice that he compete in the American race, in the drawing up of the rules for which he had a voice. As to why he should now build other cars for the sole purpose of assisting the club in giving the foreigners a race, according to their rules of this year—which may change again next year—is something that finds him in a rather diffident mood, for it costs the American maker more to build a racing car than it does the European, labor being cheaper on the other side.

When the recently-elected president of the A. C. A., who is a busy man and a business man, brand new in automobiling, gains a thorough knowledge of the situation, it is not unreasonable to surmise that there will be some change of the mushroom policy of the expensively-run and heavily-bonded clubhouse in West Fifty-fourth street, the support of which does not devolve upon the industry, nor upon automobilists generally, for each city should supply the revenue for its local club. The New York City club should be content to be a part of the whole, and not try to be the whole thing, for this is a very big country, and the people in it—automobilists as well as others—have not yet placed the seat of government in New York City, even if it is the metropolis.

The Vanderbilt Cup race deserves the support of the American makers, which it will get. As to any other race—well, the future will tell as to what degree of representative American support it will receive.

N. A. A. M. AFFIRMS POLICY OF SUPPORTING A. A. A.

AT the meeting of the National Association of Automobile Manufacturers, held at the association's headquarters, 7 East Forty-second street, New York City, Wednesday afternoon, June 3, President Henderson called attention to the existing situation as regards the position of the American Automobile Association in national affairs in this country, but stated that as the N. A. A. M. had placed itself on record some time previous as being in due accord with the aims and policies of the three A.'s, there was no necessity for further formal action.

President Henderson says: "We shall uphold the American Automobile Association and the policies which it has outlined as

represented through its Central Conference Committee, which is representative of the entire American automobile industry."

An election was held to fill existing vacancies, W. C. Leland taking office as the representative of the Cadillac Motor Car Company, vice W. E. Metzger, resigned; Marcus I. Brock was elected to represent the Autocar Company, and Edwin R. Thomas was elected to represent the E. R. Thomas Motor Company, Buffalo. The following were present: Thomas J. Henderson, A. L. Pope, W. E. Metzger, Charles C. Clifton, H. B. Joy as proxy for S. D. Waldron, H. L. Smith, Benjamin Briscoe and Windsor T. White.

AN UNBIASED VIEW OF THE SITUATION.

The *New York Times* is one of the several New York dailies which prints impartially the news of the Automobile racing controversy. Here is what it commented on Monday last:

What policy may be pursued with respect to uniform regulations for international races in America remains for the American manufacturers who compete to decide. It is true, nevertheless, that the Ostend conference is dominated by the Automobile Club of France, and that the Automobile Club of France is dominated by the French manufacturers. In fact, the head of the club Contest Committee is the managing director of the Panhard Company. If the rules dictated by the Automobile Club of France are proper rules, they will undoubtedly in the end prevail, but the American manufacturers have expressed by their action their resentment of French dictation.

RHODE ISLAND PASSES HORSEPOWER TAX LAW.

PROVIDENCE, R. I., June 1.—After having undergone numerous slight amendments for which members of the Senate and House stood out for, a compromise was finally reached and the bill passed both houses unanimously. The chief departure from precedent in this and other States is the adoption of a horsepower tax, which is \$5 per annum up to and including cars of 20 horsepower; \$10 for 20 to 30 horsepower; \$15 for 30 to 40 horsepower and \$25 for cars of over 40 horsepower. Dealers' licenses will cost \$50, and drivers' licenses will cost \$1 in the case of a car and 50 cents for motorcycle riders. The amendment prohibiting tire chains was killed and they may be used on slippery roads under the law as it now stands.

CEDRINO MEETS TRAGIC DEATH.

BALTIMORE, May 29.—Emanuel Cadrino, while practicing on the Pimlico course for to-morrow's meet, met instant death. He was working out the Fiat *Cyclone*, a well-known racing car, when the accident occurred. He had made three rounds of the mile circuit. The first he covered in 56, the second in 53 2-5, and the third in 51 seconds. Again he started with 50 seconds, and the gasoline track record in view. As the flyer turned into the backstretch, the right front tire gave way, and the wheel collapsed. The car turned a complete somersault. Cadrino was picked up dead.

Emanuel Cadrino.

Emanuel Cadrino came to this country four years ago direct from the factory of the Fiat Company in Milan, to enter the employ of Hollander & Tangeman, the American agents. Cadrino had had charge of the mechanical force of the Fiat

team for the Gordon-Bennett races in France and Germany.

Soon after arriving here he continued his racing career, which had been begun by participation in the Mont Cenis hill-climb and other Italian contests, making his first appearance at Elkwood Park in 1905. On this occasion he established a new 50-mile track record. Cadrino drove one of the Fiat cars in the Vanderbilt race of 1905, but did not take part in the race of the following year, owing to a trio having been sent from Italy to man the cars. He was second in the Briarcliff race this spring.

With the rising popularity of 24-hour track racing, Cadrino once more took up competition and evolved the winner of the last race of this character held at Morris Park at the close of last season. His most remarkable feat, however, was his driving the Fiat *Cyclone* on Ormond beach 300 miles at the rate of 77 miles an hour. He was confident at the Baltimore meet he would beat Christie's mile record of 51 2-5 seconds for gasoline cars. In fact, he had just scored 51 seconds in practice before the fatal round wherein he met his death.

His widow will take back to Italy with her on Saturday, when she sails in company with the body of her late husband, close to \$7,000, made up of insurance, bank savings, gifts by friends, of the Fiat Company, and smaller tributes, including one from the Flat Tire Club.

The funeral services took place to-day at the Italian Catholic Church, on Thirty-sixth street, between Ninth and Tenth avenues, and was largely attended by the trade and racing fraternity, with whom the deceased was deservedly popular.

FLORIO CUP RACE ON SEPTEMBER 6.

PARIS, May 20.—Italy will hold its most important high speed test under the international rules decided upon at the Ostend conference, the date of the meeting for the Florio Cup being Sunday, September 6, and the place the circuit of Bologne. Originally it had been intended to close the entries on May 31, but the decision has just been taken to postpone this until July 31. It is practically certain, however, that all the important French firms will take part in the Italian race. Owing to the importance of the event to French manufacturers. Victor Breyer, representative of the American Automobile Association in Paris, has been appointed special commissioner in France for the Florio Cup race.

GERMAN CLUBS ASK CONCESSIONS FOR TOURIS

BERLIN, May 15.—At the last meeting of the delegates of the Imperial Automobile Club and the affiliated clubs, the resolution was passed to petition the government to relieve foreign motor cars touring in Germany from all taxes for a period of sixty days. It will be interesting to see whether or not the clubs will have any success.

PROGRESS IN JERSEY TEST CASE.

TRENTON, N. J., May 29.—As was generally anticipated, the hearing in the case of R. H. Johnston, who is testing the constitutionality of the Jersey law on behalf of the touring bureau of the White Company, resulted in his conviction by Police Justice Harris, and a fine of \$100 was imposed. The White Company was represented by X. P. Huddy and Peter Backes, while Assistant Attorney-General Nelson Gaskill and Theodore Backes appeared for the State. Before judgment was rendered, Mr. Huddy made a motion to dismiss the complaint, basing it upon the following grounds:

First—That the required tax of \$10 per year which the New Jersey law demands of a non-resident owner of an automobile is a revenue tax and not a license fee imposed under the police power; that this revenue tax imposes an unconstitutional restriction upon the privilege of a non-resident citizen to enter the State of New Jersey, thereby infringing his liberty as guaranteed by the Federal constitution.

Second—That the New Jersey tax of \$10, for the non-payment of which this defendant was arrested, constitutes an unconstitutional tax on interstate commerce, violating the Federal constitution which places interstate commerce within the exclusive jurisdiction of the United States government.

Third—That this court has no power to impose a fine as directed by the New Jersey statute, since the New Jersey tax in question is a revenue tax, this proceeding being non-criminal in its nature, and this court here to-day, if it imposes a penalty under the revenue tax, will be exercising the power of taxation, which is exclusively delegated to the legislative department of the government to the exclusion of the judicial.

Fourth—That this court has no power to impose a fine because the penalty, as prescribed in the New Jersey law, is discretionary with this court up to the sum of \$100, and that in order for the law to be valid, the exact and precise fine must be determined by the law imposing the tax, and the power of the legislature to impose a tax cannot be delegated to this court.

Justice Harris overruled this motion, whereupon an exception was taken. The defendant was then convicted and sentenced to pay a fine of \$100. Mr. Johnston's counsel immediately gave notice of an appeal to the Court of Common Pleas, where the constitutional questions involved will be determined.

MORA "SIX" FIRST VANDERBILT ENTRY.

Although there have been rumors and statements of more weight than usually attach to the latter, that several cars had already been actually entered for the Vanderbilt Cup race this fall, Chairman Jefferson De Mont Thompson's letter of a few days ago to W. W. Burke of the New York branch of the Mora Company, Newark, N. Y., places a very different light on the matter. To S. H. Mora belongs the honor of having actually made the first entry for the American classic, and his company will be represented by a six-cylinder car which is now under construction at the new Mora factory.

MAY HAVE TWO CARS IN THE VANDERBILT.

It is said that Harry Levey, a New York sportsman, has pretty well made up his mind to make a double entry for the Vanderbilt Cup race through the nomination of his Hotchkiss and Woolsley racers. The Hotchkiss to be entered is the 130-horsepower car which Elliot T. Shephard drove in the last international race on Long Island.

Mr. Levey is an enthusiast with money to back his new hobby. His first entrance into the racing game was made at Ormond last winter with this same Hotchkiss.

TO START BUILDING PARKWAY SATURDAY.

Much enthusiasm has been evinced by the fraternities of sport and trade in the formal beginning of the Long Island Motor Parkway work at Central Park, Long Island, on Saturday, when at half past three in the afternoon, W. K. Vanderbilt, Jr., will cast the first spadeful of dirt. A big, spontaneous outpouring of automobilists is expected at the ceremony, which will take place on the Barnes tract, Jerusalem road.

VANDERBILT CUP RACE TO BE HELD OCT. 24

THE Vanderbilt Cup Commission has set Saturday, October 24, as the date for the next international race in this country. The course will be announced at least thirty days before the race. The distance will not be less than 250 nor more than 300 miles. Entries will close on September 1. Deferred entries will be accepted up to October 1 at a double fee of \$2,000.

The national automobile clubs of France, Germany, Belgium and Great Britain have shown their appreciation of the Automobile Club of America's proposal to run a road race under European rules by casting their American racing lot with the New York Club, and giving it formal recognition as their representative in this country. At a meeting of the club's board of governors on Tuesday the following telegrams were presented:

Paris, June 2, 1908.

The Automobile Club of America, New York:

The Commission Sportive has decided to-day to recognize as official the Grand Prize race, organized by the Automobile Club of America, which is to be run under rules adopted at Ostend, and to disqualify all French cars taking part in the Vanderbilt Cup race; and, furthermore, the Automobile Club of France will continue to recognize no one but the Automobile Club of America as its official representative.

[Signed] BARON DE ZUYLON.

London, May 30, 1908.

The Automobile Club of America, New York:

Your position as our representative will be upheld. Congratulate you on organizing Grand Prize race. Will endeavor to induce entries from this side.

[Signed] J. W. ORDE, Secretary.

Brussels, June 2, 1908.

The Automobile Club of America, New York:

We will maintain and respect the agreements and rules adopted at the congress of Ostend in 1907.

[Signed] AUTOMOBILE CLUB DE BELGIQUE.

Berlin, May 29, 1908.

The Automobile Club of America, New York:

Imperial German Club has joined by letter, dated May 25, the protests of the French and English clubs, and has enjoined German automobile factories not to participate in Vanderbilt Cup race. We endorse the projected Grand Prize race of the Automobile Club of America.

KAISERLICHER (IMPERIAL) AUTOMOBILE CLUB.

Another cable was also presented, which is more interesting and somewhat sensational. It was from W. S. Hogan, one of the club's foreign representatives, and was as follows:

Paris, May 31, 1908.

The Automobile Club of America, New York:

French club much interested in your Grand Prize race. Holding extraordinary meeting Tuesday. Will then cable fully.

French club has also received cable from American Automobile Association offering to amend Vanderbilt conditions, if proposals sent direct to them.

[Signed] HOGAN.

"No cable was ever sent to the French or any other European club that could be contorted into an offer to amend the Vander-

bilt Cup rules," said Chairman Thompson, of the Vanderbilt Cup Commission. "The only cable transmitted was that directed by the Racing Board at its last meeting to be sent notifying the Automobile Club of France and the Royal Automobile Club of Great Britain that the A. C. A. was merely a local club, and that any communications sent direct to the American Automobile Association would receive courteous attention." The contents of this cable embraced solely a copy of the following resolution, which has already been widely published:

RESOLVED: That Jefferson deMont Thompson, the chairman of this Board and of the Vanderbilt Cup Commission, be instructed to notify the corresponding boards or committees of the representative automobile associations and clubs of foreign countries that the Automobile Club of America is a local club situated in the city of New York without national functions or jurisdiction, and

That all communications concerning national or international affairs must be addressed to the American Automobile Association at its headquarters, No. 437 Fifth avenue, New York City, or to the chairmen of its respective boards; and

That so far as the rules of the Vanderbilt Cup race for 1908 are concerned, on receiving a communication direct from any foreign association or club concerning such rules, this board will give such communication prompt and courteous consideration.

A press dispatch from Savannah, under date of Tuesday, states that at a meeting of the local club held that day, the terms of a contract with the New York club for a race in November were accepted, that the action was telegraphed to the New York club's contest committee chairman, and that his acknowledgment had been received. The dispatch further stated that the Savannah Automobile Club would resign its membership in the A. A. A.

President Hotchkiss, of the A. A. A., makes the following comment on the action of the French club:

If the French manufacturers who compose the majority of the Committee Sportive of the French club, and one of whom is also the chairman, decline to compete under American rules, then the loss will be theirs, not ours. Although this feature concerns us but slightly, we are already assured of a sufficient number of foreign entries to give an international flavor, and are able to promise the automobile public that the 1908 Vanderbilt Cup race will be the banner event in its classic history. This race will be held October 24, over a stretch of the new Long Island Motor Parkway and necessary adjoining roads to complete the most perfect course ever supplied for such a race. William K. Vanderbilt, Jr., president of the Parkway, on Saturday next will turn the first spadeful of earth, and 1,500 laborers will be at work two days later.

It is perhaps pertinent to inquire why it is that a local American club in New York City is so anxious to assist a few disgruntled French manufacturers to compete with each other in a race in the United States. As for the American Automobile Association, it believes in America for Americans, and in the international supremacy of the American automobile through American contests conducted under American rules. If the French club does not want to compete under such rules, the loss is, I regret, theirs, not ours.

WILL GIVE FOREIGNERS A RACE TO SUIT.

The directors of the Automobile Club of America, of New York City, met last week and adopted the following resolutions:

"Resolved, That the Automobile Club of America hold in the fall of 1908 a road race under the rules of the International Association of Recognized Automobile Clubs as adopted at Ostend, July 14, 1907, and that the contest committee of the club be empowered to organize and carry out such a race.

"Resolved, That the Automobile Club of America give a gold cup, to be known as 'The Grand Prize of the Automobile Club of America,' to be competed for annually in a road race to be conducted under the auspices of the Automobile Club of America under the rules adopted each year by the International Association of Recognized Automobile Clubs.

Resolved, That the Automobile Club of America organize and conduct each year the following events:

"1. The international road race for the grand prize of the Automobile Club of America under the rules of the International Association of Recognized Automobile Clubs as may be adopted.

"2. An international stock car race for the Briarcliff trophy.

"3. A long distance touring car contest.

"4. A hill climbing contest.

"Resolved, That the secretary of the club be instructed to communicate these resolutions to all of the clubs and organizations with whom it is affiliated."

LOOKING FOR VANDERBILT COURSE LOOPS.

Jefferson deMont Thompson, chairman of the A. A. A. Racing Board, and A. R. Pardington, manager of the Long Island Motor Parkway, Inc., in company with different members of the Board of Supervisors of Nassau county, have made several trips over the highways of that county during the past fortnight with the object of discovering what roads might be available for combination with the parkway stretch for use for the Vanderbilt Cup race next October. They intimate that their pilgrimages have not been in vain, but withhold for the present any hint of the route they have in view.

Mount Vernon (N. Y.) Automobile Club Ready for the Start of Its First Parade and Run.

MICHIGAN'S STATE BODY ELECTS OFFICERS.

GRAND RAPIDS, MICH., May 29.—The annual meeting of the Michigan State Automobile Association was held in this city today. Officers were elected, a good roads committee appointed, and a banquet was held in the evening at the Grand River Auto Club, at which President George was the guest of honor.

The new officers elected for the ensuing year are: President, Edwin S. George; first vice-president, A. A. Barber; second vice-president, J. R. Jackson; third vice-president, James G. Hatfield; secretary, Dr. D. Emmet Welsh; treasurer, Sidney D. Waldron. The following chairmen were named for committees: Good roads, Edwin S. George; tours and contests, Sidney D. Waldron; membership, J. R. Jackson; law, Dexter M. Ferry.

The association decided to make good roads the principal field of its endeavor this year, and the good roads committee will outline a plan which will be followed by the clubs belonging to the association. The association includes clubs at Detroit, Grand Rapids, Kalamazoo, Hart, Flint, Battle Creek and Cadillac.

DAVIS AND RIKER WILL GO TO BUFFALO.

BRIDGEPORT, CONN., June 2.—President F. T. Staples, of the Automobile Club of Bridgeport, has appointed the standing committees. They and their chairmen are: Membership, H. D. Gates; road signs, Arthur K. L. Watson; contests, Ralph M. Sperry; road repairs, H. E. French; tours and runs, H. D. Gates; legislative, Goodwin Stoddard; public safety, Jonathan Godfrey.

S. T. Davis, Jr., and A. L. Riker were appointed to represent the club at the Buffalo convention.

MOUNT VERNON CLUB HAS INITIAL PARADE.

MOUNT VERNON, N. Y., June 1.—The parade and run of the Automobile Club of Mount Vernon on Saturday afternoon, May 23, was a marked success. The interest shown in the initial appearance of the club in an event of this sort and the large number of cars in line argues well for a continuance of the enthusiasm which the organization manifests. All Mount Vernon turned out to do honor to the occasion.

GENEVA CLUB CHOOSES OFFICERS.

GENEVA, N. Y., June 2.—At the annual election of the Geneva Automobile Club, the following officers were chosen: President, F. W. Herendeem; vice-president, M. F. Blaine; secretary and treasurer, C. W. Fairfax. It was voted to send delegates to the Buffalo convention.

MONTREAL'S CLUB REELECTS M'DONALD.

MONTREAL, QUE., June 1.—A year of prosperity, with a considerable growth in membership and a healthy increase in funds, were reported at the annual meeting of the Automobile Club of Canada, held at the Windsor Hotel, the vice-president, U. H. Dandurand, presiding in the absence of President McDonald.

The work done to secure good roads, especially the competition for \$200 cash prizes offered for farmers who did the best work to improve the roads in front of their places, was the main feature of the report.

As a result of the work done by the club to suppress any breaches of the motor vehicle law, the report showed that there had been very few serious motor accidents during the past year, while not one of these could be attributed to reckless driving.

For the coming year the directors' program was to continue the good roads propaganda to the utmost limit. They intend to take the matter up with the Provincial Government, and will also spend as much money as they can to interest the proprietors on the Island of Montreal in improving their roadways. In addition to this, a series of route and caution signs will be tacked up on leading roads, showing the way to and from Montreal, and warning against dangerous pieces of road. The club also decided to take active steps to run down any motorists who break the laws by any kind of reckless driving.

The following officers were elected: President, Duncan McDonald; vice-president, U. H. Dandurand; directors, F. H. Anson, A. J. Dawes, Eugene Tarte, Wm. Caruthers, A. Berthiaume and Clarence Smith; secretary-treasurer, G. A. McNamee.

STRONG ARGUMENTS FOR JOINING CLUBS.

PITTSBURG, June 2.—In Paul C. Wolff, its secretary, the Automobile Club of Pittsburg has a live wire full of effective electricity. In the club's monthly publication he puts up arguments for automobilists joining the club, which may well be read and might well be used by other clubs in their canvass for members. The appeal says in part:

"The real reason for this club's existence is the work it is doing for the benefit of every user of a motor car in this vicinity, all of whom should certainly be interested in having the roads of the county properly maintained and marked by legible signs, in having a place where maps can be consulted and touring information secured, in the existence of a strong organization willing to protect them in case of unjust arrest, to endeavor to defeat any unfair legislation or local ordinances that may be introduced, and to work for the enactment of more liberal, up-to-date laws.

"This, the Automobile Club of Pittsburg is doing and in this it should have your support. As a member you also become a member of the State organization and of the American Automobile

Association, the National body. As a member of the former you aid in carrying on the work in Pennsylvania—of the latter in Federal legislation where the motorist must have recognition. You also benefit directly, having at your service valuable touring information.

"There are, of course, many men to whom this means nothing. The main objects for which club, State and national organizations are working, look to the advantage or benefit of all motorists alike, members or non-members, and there will always be individuals so small that knowing that this work will go on whether they contribute or not, and if successful that they will share the benefits, will keep their money in their pockets. The work can and will be done without their help, for there fortunately is a larger class, who, if they see efforts being put forth in directions which will benefit them, are perfectly willing to do their part toward supplying the sinews of war. These we wish to add to our membership list."

NEW YORK CLUB URGES SOME DON'TS.

NEW YORK, June 3.—The Automobile Club of America's committee of safety, in a circular to the press, repeats its recommendations of a year ago as to certain desirable reforms as follows: "We urge upon motorists the wisdom of not using acetylene lights on ferries or in closely built-up and well-lighted portions of cities and towns; also not to cut out the muffler, except in places where the noise of the exhaust cannot annoy or offend other users of the highway; also to avoid flooding the engine with oil, thus creating offensive smoke and odor."

BUFFALO CLUB TO ENTERTAIN ORPHANS.

BUFFALO, June 2.—The Automobile Club of Buffalo has designated Wednesday, June 17, as Orphans' Day, and as there are few organizations in the country in which the appeal for a worthy charity meets with a more generous response, it is a foregone conclusion that none of the youngsters will be forgotten. The total membership of the club is now 1,243.

HARTFORD'S CLUB CONTINUES TO GROW.

HARTFORD, CONN., June 1.—Now that the endurance run is off the slate, the Automobile Club of Hartford is making ready for Orphans' Day on June 13. Needless to say, the orphans throughout the city anticipate the day with longing.

The membership of the club continues to increase, and it is safe to assume that if things hold out the way they have been going for some weeks past, the membership will touch the 300 mark by autumn. There is much demand for a hill climb this fall, and one will be held, though it is doubtful if the same course will be selected, which, to the minds of many, is far too dangerous.

PENNSYLVANIA FEDERATION NOW HAS 24 CLUBS.

PITTSBURG, PA., June 2.—There are now twenty-four clubs in the Pennsylvania Motor Federation, the Monroe County Automobile Association, the Johnstown Automobile Association, and the Beaver Falls Automobile Club having made applications for membership. An active campaign is also being made for individual members to add weight and recruits to the Federation's influence and fight for more reasonable local and State legislation.

TO BANQUET BROOKLYN'S BENEFACTORS.

BROOKLYN, N. Y., June 3.—By way of formal recognition of their untiring and successful efforts in securing the passage of the Cypress Hills bill, the Long Island Automobile Club on Friday evening will give Senator Eugene M. Travis and Assemblyman William A. DeGroot a dinner at the Crescent Club's country clubhouse on the Shore Drive. The bill provides for a boulevard connecting Highland Park with Forest Park, and continuing out to the good roads of Long Island.

FARMAN WANTS TO COMPETE WITH WRIGHT BROTHERS

PARIS, May 20.—There are hundreds of sportsmen in France who would readily put their name to a big check if by so doing they could fathom the Wright Brothers' mystery. France would like to believe that she leads the world in aeronautics, and at the bottom does believe it; but her peace of mind is troubled at too frequent intervals by reports from across the Atlantic of the doings of the two brothers from Dayton. Just when Delagrangé or Farman have made a magnificent performance in the presence of thousands of spectators and on a ground as accessible to Parisians as Central Park is to New Yorkers, just when she is ready to shriek with excitement at the prospect of wresting the secret of the feathered world, a blunt message comes from the West announcing a performance that makes the French flight look like the scurry of a scared hen. So often have they come that the Frenchman who at first scoffed and still calls them *vols de canards*, has begun to doubt, and has finally reached such a state that he would give his hard cash to know the truth.

Henry Farman, the Frenchman of British origin who has nothing of the bluffer in his make-up, has endeavored to solve the mystery by a public challenge, and now comes forth with \$5,000 stakes and the promise of a much larger amount if the Wright brothers will meet him in open competition in France for both time and distance flights. In his letter to the press the ex-automobile racing driver writes as follows:

"For some time I have seen in the newspapers that the Wright brothers have established numerous records, and that the next day everything connected with them has been denied. Personally I believe that the Wright brothers are very expert in aeronautics and capable of executing good flights. However, my small experience allows me to affirm that at any rate the published accounts of both recent and old flights are absolutely inexact. Among other examples I may mention the state-

ment in one account that three or four miles had been covered in 15 minutes, or something approaching this. Now it is absolutely impossible to fly as slowly as this. I am ready, however, to issue a challenge for speed and distance to be run in France.

"I can offer immediately stakes of \$5,000 and am certain of being able to get together a much larger sum if the Wright brothers accept the challenge. I propose this match with every confidence, for I have made more than 400 flights and covered a distance of about five kilometers, remaining in the air five minutes over a ground much too small, which obliged me to make numerous turns, and in addition was handicapped by the public. My present apparatus, in its actual condition, can remain 24 minutes in the air at a speed of 50 miles an hour, and with the improvements that I shall make I am certain in a short space of time not to be far from establishing an hour's record, but of course not on the Issy-les-Moulineaux ground." Farman is now busy packing up his apparatus for shipment to Ghent in Belgium, where he is under engagement to attempt flights on an open ground admirably suited for record breaking. Delagrangé has left for Turin, Italy, in the hope of winning a pile of money for a fifteen-minute flight. Both Farman and Delagrangé are using their Voisin apparatus with which they have made all their flights in the neighborhood of Paris. Farman has the intention of modifying his cooling system so as to carry a much larger quantity of water, the small amount now carried boiling away in a few minutes, whenever the engine is not running satisfactorily. During the summer he should take possession of the Flying Fish, also built by Voisin, but engined by Renault, with which he believes something sensational can be done, owing to the great improvement in its capacity for staying aloft gained by the new motor.

WM. E. METZGER'S CAT IS OUT OF THE BAG AT LAST

THE curtain has been raised on the "Metzger Mystery." It disclosed the Everitt-Metzger-Flanders Company, a million-dollar Detroit corporation, with B. F. Everitt, general manager of the Wayne Automobile Company, for its president; William E. Metzger, formerly of the Cadillac Motor Car Company, and still a large stockholder in the Northern Automobile Company, for its sales manager; and W. E. Flanders, once the Ford Motor Company's factory manager, now with the Wayne Automobile Company in the same capacity, at his old job of running the shop.

To give an idea of the financial strength of the new concern and at the same time let in some additional light on its genesis, it is to be noted that C. L. Palms, Dr. J. B. Book, W. T. Barber, Allen T. Bennett, of Port Huron, Thomas Walburn and E. Le Roy Pelletier are associated with the "big three," who lend their hyphenated names to Detroit's latest big automobile building enterprise. One may get a hint of the pushing policy to be pursued from Mr. Pelletier's being put in charge of the publicity, he having retired from the Maxwell-Briscoe Motor Car Company's advertising desk to assume it. Pelletier, by the way, is a considerable stockholder in the new company.

The campaign which will be inaugurated by the company calls for the production next season of 12,000 four-cylinder 30-horsepower cars. They will bear the nameplate "Everitt" and sell at not over \$1,200. The chassis will have a 103-inch wheel-base be fitted with a magneto, and have three or four styles of body equipment. Later other models are in contemplation. The Everitt will be a licensed car.

This deal, says Metzger, has so long been in contemplation

that a car of the proposed construction has already been built and so far tried out that sample machines will be ready by July 1 and shipments will begin in October.

The Everitt will be built at the factory of the Wayne company, which has been absorbed by the "big three," and probably at other big factories, in which Mr. Metzger is a large stockholder.

Fair Women Guests at Trade Banquet.

By way of celebrating its birth, the Everitt-Metzger-Flanders Company, of Detroit, gave a dinner Tuesday night at the Café des Beaux Arts, New York. B. F. Everitt, president; W. E. Metzger, sales manager, and E. LeRoy Pelletier, publicity engineer, were present on behalf of the company, to personally extend its hospitality. A novel innovation for a trade banquet was the invitation to the guests to bring their wives or sweethearts. Many took the hosts at their word, and, accordingly, the banquet was graced by the presence of Mrs. E. LeRoy Pelletier, Mrs. E. P. Chalfont, Mrs. F. J. Wagner, Mrs. R. G. Betts, Mrs. R. B. Johnson, Mrs. R. A. Field, Mrs. E. W. Merrihew, Mrs. Joseph Gilbert, Mrs. John H. Gerrie, Mrs. Alfred Reeves, Mrs. Ward, Mrs. Roy McCardell, Mrs. A. B. Tucker and Miss Lasker. Gold hand mirrors were given the ladies as souvenirs.

The piece de resistance of the menu was frogs' legs, personally conducted from Detroit by Messrs. Everitt and Metzger. Benjamin Briscoe acted as toastmaster, and Messrs. Chalfont, Reeves, Everitt, Pelletier, Metzger, McCardell, Schwarzkopf, Gilbert and DeLisser were among those called upon for speeches. The guests numbered close to fifty.

EVELAND TO HEAD TRADE ASSOCIATION.

NEW YORK, June 1.—The annual meeting of the stockholders of the New York Automobile Trade Association, Inc., was held at its headquarters in the Bryant Park Building this morning, and the following were elected as officers for the coming year: President, Frank Eveland, A. G. Spalding Brothers Company; first vice-president, General John T. Cutting, Oldsmobile Company of New York; second vice-president, E. C. Partridge, Wyckoff, Church & Partridge; treasurer, B. Blumenthal, West End Auto Palace; secretary and manager, Walter R. Lee. An amendment to the by-laws providing that all officers except the secretary shall be chosen from the members of the board of directors was unanimously carried, thereby increasing the latter from nine to twelve. The directorate, which was unanimously elected, consists of the following: C. Andrade, Jr., R. M. Owen Company; W. Harradon Victor Auto Storage Company; Richard Newton, Atlantic Motor Car Company; C. P. Skinner, Mitchell Motor Company; R. B. Van Dyke, American Locomotive Auto Company; Peter Fogarty; S. B. Bowman, S. B. Bowman Auto Company; and George Bennet, the White Company. The treasurer's report showed the association to be in a very prosperous condition.

WALTER WHITE'S INJURIES NOT SERIOUS.

Walter White's injuries, received on the occasion of the hill-climb at Cincinnati last week, are proving not to be as serious as was at first reported, although they will keep him confined to the hospital for several weeks to come. Of the many conflicting stories that got abroad concerning the cause of Mr. White's mishap, none was entirely correct. It seems that in his practice spins, the driver of the White received a wrong impression as to where the finish line of the climb was to be, and did not discover his mistake, until coming up at better than a mile a minute, he saw the spectators banked where he expected to find the finish line. He managed to get across the line all right, but the turn beyond the car skidded and turned turtle.

BOSTON DEALERS ELECT NEW OFFICERS.

BOSTON, June 1.—The annual meeting of the Boston Automobile Dealers' Association, Inc., was held to-day at the offices of the association, 5 Park square, and as there was much interest in the choice of officers the attendance was large. Reports were presented by the secretary and manager of the annual show, Chester I. Campbell; by Treasurer F. A. Hinchcliffe, and other officers and committees, after which the members proceeded to ballot for officers, the result being as follows: President, John H. MacAlman, agent for the Columbia; vice-president, J. S. Hathaway, manager the White Company; treasurer, F. A. Hinchcliffe, manager of the Winton Motor Carriage Company; clerk, Chester I. Campbell; directors, John H. MacAlman, J. S. Hathaway, F. A. Hinchcliffe, J. W. Maguire, of the J. W. Maguire Company, agents for the Pierce; A. P. Underhill, of the Reed-Underhill Company, agents for the Knox; Charles E. Fay, manager the Ford Company; C. F. Whitney, manager of the Park Square Auto Station, agents for the Berliet and the Stoddard-Dayton; E. A. Gilmore, of the Whitten-Gilmore Company, agents for the Thomas; and George H. Lowe, of the Lowe-Crawford Company, agents for the Crawford; secretary, Chester I. Campbell. Mr. Hathaway succeeds Mr. Lowe as vice-president. Messrs. Whitney and Gilmore are new members of the board of directors. At a meeting of the directors following the stockholders' meeting Chester I. Campbell was unanimously elected as manager of the Boston Automobile Show to be held in 1909.

A CENTURY A DAY FOR ONE HUNDRED DAYS.

INDIANAPOLIS, IND., June 1.—With a century a day for one hundred consecutive days as its object in view, a Premier car started to-day on a brand new variety of long distance stunts. From to-day until September 8, the Premier Motor Manufacturing Company proposes to have its crew keep the car running, good weather or bad. The Premier will carry a full quota of passengers.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

A petition has been circulated among the Hartford, Conn., workmen to the effect that the city patronize home industry and purchase a Pope-Hartford ambulance, even though another maker would do the work for nearly 25 per cent. less.

Michigan's municipal executives are evidently very much taken with the merits of the Franklin, as within the last fortnight no less than three of them became owners of 1908 Franklin models. They are Mayor C. C. Green, of Battle Creek; the Mayor of Traverse City, and the Mayor of Muskegon, Mich.

As illustrating the longevity of Winton cars it is interesting to note that Charles Gorndt, of Cleveland, owns a 1900 single-cylinder Winton that outspeeds and outclimbs everything under 30 horsepower that he has encountered in his travels. Gorndt's single-cylinder measures 5 3-8 x 5 3-8 and is rated at less than 12 horsepower.

In making mention of the changes in the sales management of the Spare Motor Wheel of America, Ltd., in THE AUTOMOBILE last week, it was inadvertently stated that the sales department at 237 Michigan avenue, Chicago, was a branch house, while as a matter of fact, it is the main office of the company. The factory is located at St. Anne, Ill.

That the creditors of the Toledo Motor Car Company are in no wise in a hurry to realize on their claims against that company is shown in the fact that they authorized the receivers to reject an offer of \$500,000 for the plant as it now stands. F. A. Scott, of Cleveland, who was appointed receiver some time ago at the request of the creditors, is now making a complete inventory of the assets of the concern and his present judgment is that it ought not to be disposed of for less than \$800,000.

Even the claims of his constituents and the popular prejudice of the rural voter against having his representative in Congress mixed up with them "durned otto-mobeels," could not deter Speaker Joe Cannon from accepting the invitation of Congressman Landers to accompany him in a 40-horsepower Studebaker from Washington to Indiana. Others in the party who will participate in the two weeks' outing are Senator Hemingway, Mr. Buzby, secretary to the Speaker, an official cabinet photographer, and C. F. Redden, manager of the New York branch of the Studebaker Automobile Company. Refreshments for the party are being carried in a 30-horsepower Studebaker, which doubtless will not be lost sight of during the trip.

Just to show that the Detroit Electric could do it, George Bacon, chief engineer of the Anderson Company, Detroit, Mich., builders of the car, and P. Driscoll, of Harrisburg, Pa., the company's eastern sales manager, drove one of the Detroit cars from Washington to Baltimore under its own power. The distance is about 56 miles by road, but the achievement lies not so much in the distance covered as in the nature of the road, which is hilly and has a poor surface. The run was made on Monday and was repeated in the opposite direction the next day. The handy way in which the Detroit car did the trick resulted in the Dupont Company taking the agency for it in Washington. An attempt will be made on the Philadelphia-Atlantic City run later.

NEW AGENCIES ESTABLISHED.

The Goodyear Tire & Rubber Company has just opened a new branch store at 2005 Euclid avenue, Cleveland, O., under the management of C. C. Hamerle, formerly connected with the New York office.

Michelin tires will soon be represented in Cleveland, the Michelin company having decided to open a branch store at 2001 Euclid avenue, next door to the new quarters of the Goodyear company. Richard Tracy will be in charge.

The Lancaster Automobile Company, Lancaster, Pa., agents for the Pope-Waverley and the Buick, have added the Franklin to their line, while the Kentucky Automobile Company, Louisville, Ky., has done likewise in its territory, and the De Long Machine Company, Shreveport, La., has made arrangements to handle the Franklin line exclusively.

A. A. Lederman, for the past four years assistant engineer of the George N. Pierce Company, Buffalo, N. Y., has just been appointed agent for the Pierce cars in central New York. Mr. Lederman has opened temporary offices in the Steward building, Utica, N. Y., pending the erection of a garage. The new agency will be known as the A. A. Lederman Company.

The Foss-Hughes Motor Car Company, Broad and Race streets, Philadelphia, Pa., has taken over the business of the Noblitt & Fassett Company, and in future will act as agents for the Pope-Hartford car. John H. Fassett, who was president of the latter concern, will be identified with the Foss-Hughes company, with which he severed his connections a few months previous, to take charge of the other concern.

RECENT TRADE REMOVALS.

The Swinehart Clincher Tire Company's New York branch is now located in its new quarters at 875 Seventh avenue, near Fifty-ninth street, New York City. The entire building at the address in question has been leased by the Swinehart interests, thus permitting of the installation of much superior facilities than those available at the old place.

PERSONAL TRADE MENTION.

Burt Morley, formerly with Hayden Eames and the Ferro Foundry & Machine Company, of Cleveland, O., has just been appointed manager of the Diamond Rubber Company's branch at Detroit, Mich.

W. N. Booth has just been appointed assistant manager of the Oldsmobile Company of Cleveland, the branch house of the Olds Motor Works, of Lansing, Mich. Ralph R. Owen is the branch manager.

E. B. Gallaher, manager of the American branch of the Maja Company, Ltd., returned last week from a flying trip to the other side, where he has been for the past three weeks on business connected with the Maja Company and the affairs of its American branch.

H. N. Anderson, formerly with the Dayton Motor Car Company, Dayton, O., has just joined the engineering forces of the Speedwell Motor Car Company, also of the same city. The latter concern now has a large new plant in the course of construction and its business is growing rapidly.

NEW TRADE PUBLICATIONS.

Hartford-Suspension Company, Jersey City, N. J.—"Auto Comfort" is the latest comer to the field of automobile trade house organs. As its name implies, its mission is to tell of the comfort and safety derived from the use of the Truffault-Hartford shock absorbers, although it will naturally contain much other matter of interest to the autoist and driver. Copies will be forwarded for the asking.

Warnor Instruments Company, Beloit, Wis.—A pamphlet on the speed-indicator question that will be found of considerable value and interest by autoists generally has just been issued by this firm, under the title of "The Final Truth About Speed Indicators." It is written in a plain, everyday, common-sense manner, and there are no unintelligible technical terms to confuse the layman, although the subject is one that is difficult to explain without the use of such aids. Copies will be forwarded gratis to autoists and drivers upon request.

Boston Gear Works, Norfolk Downs, Mass.—In addition to describing and illustrating the full line of gears of every description made by this firm, its catalogue, for 1908, which is more on the style of a handbook, also contains a number of handy tables of engineering data. It is an 88-page pamphlet in paper cover and contains a great deal of information concerning gears of every type in condensed form. In addition to gears, this firm also makes cast-iron grooved pulleys, star escape wheels, standard brass ratchets, heavy clock and motor springs, auto steering gears, chains, universal joints and the like.

Empire Metal Company, Syracuse, N. Y.—"Bearing on the Question" is the title of a booklet that has to do with bearing metals and particularly with "Empire" bearing metals. This concern has been in the business of making bearing metals for the past 28 years, so that its statement that no one alloy can be proper for all kinds of service may well be taken as the result of ripe experience. The numerous brands manufactured, such as "Genuine," "Silver Bronze," "Samson," "Motor," "Imperial," "Copper Hardened," "Triumph," and others, are described and the service they are intended for outlined. Another booklet from the same concern describes its silver metal galvanizing flux. It makes improved galvanizing possible at a decreased cost.

Oakland Motor Car Company, Pontiac, Mich.—One of the most interesting things in the catalogue of this concern, to the seeker after a car, is the little diagram to be found near its close. It is a simple affair, and not much space is given to it, but it shows better than several pages of argument could, how the annoying vibration of the two-cylinder vertical motor has been overcome in the Oakland power plant. Rather a novel and unusual feature of this catalogue are some reproductions of blueprints in natural tints, showing different views of the chassis and chief essentials of the car, drawn to scale. It is a 32-page pamphlet in buff covers, with the name Oakland embossed on them, and is an attractive piece of catalogue work, from the typographical point of view, as well as that of the man who is seeking information about the Oakland cars.

Stewart & Clark Manufacturing Company, Chicago.—One of the first things to greet the eye on opening the very attractive 1908 messenger of this concern is the ironclad five-year guarantee which the makers of the Stewart and American instruments give with every instrument they manufacture. This guarantee covers materials, mechanical construction and accurate operation of the instrument, flexible shaft and all connections, any instrument falling to give proper satisfaction or proving defective in material or construction during that period being repaired or replaced free of charge. Throughout the remaining 56 pages of the attractively illustrated catalogue the Stewart & Clark Company show the painstaking manner in which the instruments that can be covered by such a guarantee as this are made. There are no secrets about the Stewart and American speedometers, as every part is illustrated and its functions described. The book is printed on heavy surfaced paper in a most attractive style, while the illustrations, made from photographs, are unusually well executed. Nothing is left untold that those in search of speedometer information would wish to know.

INFORMATION FOR AUTO USERS

Volta High-Tension Magneto.—This is an extremely simple type of high-tension magneto of the self-contained type that is now being put on the market by the Witherbee Igniter Company. As will be seen from the accompanying illustration, the Volta is of the usual permanent magnet type and is equipped with

DISTRIBUTOR END, VOLTA MAGNETO.

a synchronous distributor. Both the armature and the distributor shafts are mounted on annular ball bearings so that even the small amount of attention ordinarily required for lubrication on such a machine has been further reduced, only two or three drops of oil per bearing being required each month. The construction throughout is of the most simple and durable kind. The same concern is also placing on the market the Wico storage battery charger, the Witherbee Igniter Company having procured the rights to manufacture and sell this

NEW WICO STORAGE BATTERY CHARGER.

charger from the inventor, M. R. Hutchinson. The illustrations show the charger connected to an electric light socket and a storage battery, the jar shown containing the alternating current rectifier. This changes an alternating current to a direct current, while the lamps cut the current down to the proper rate for charging. The small lamp shown is a pilot light to enable the state of the charge of the battery to be determined. By reversing the spring controlled switch forming part of the set, this five-ampere lamp is lighted and unless it burns brightly the battery is not fully charged. The entire outfit is designed to be carried on the car in the pressed steel containing case provided. It is extremely convenient for touring, and more than one set can be charged at a time.

Rubberized Leather.—This is a new departure in chrome tanned leather, insuring great strength and extra wearing qualities. It is being manufactured and marketed by the Gloversville Rubberized Leather Tire Company, Gloversville, N. Y., and is the result of a new secret process, which makes the material water resisting, as well as soft and pliable, always retaining its shape after wetting. It is especially adapted for the manufacture of leather tire and leather treads. This firm was one of the first to take advantage of the growing demand for a specially prepared chrome leather for automobile use, and the universal favor with which this has met from all tire, tread and casing manufacturers shows the step to have been well taken.

Kinsler-Bennet Pin Universal.—The Kinsler-Bennet Company, Hartford, Conn., have just placed a new universal joint of the pin type, designed especially for automobile use, on the market. It is composed of two yokes, four pins and an outer ring, it being possible to mount or take down all these parts without the aid of tools, as no screws or bolts are employed in the construction of this new universal joint. The yokes are held by the plate in such a manner that it is impossible for them to

ASSEMBLY KINSLER-BENNET UNIVERSAL.

spread, while the outer ring holds the pins in position, and is itself held by two shouldered steel spring plugs, which also provide a means of oiling. In the center of the joint is a chamber holding a considerable quantity of oil. From this, the oil is fed through a hole in each pin connecting with outlets to all of the bearings so as to provide effective lubrication. All the working parts are of hardened steel, the yokes being drop forgings. This joint has been designed particularly with a view to use on automobiles where the service conditions are unusually severe, but it is also being marketed for machine tool use.

"Long Arm System" Parts.—The latest addition to its line of automobile parts, recently made by the Long Arm System Company, Cleveland, O., is a new set of steering reaches of the ball-socket and buffer type, which are now on the market.

DETAILS OF THE NEW BALL-SOCKET AND BUFFER "LONG ARM" STEERING REACHES.

They are furnished in three sizes, suitable for 1, 1 1/8 and 1 1/4-inch balls, and are of interest chiefly for their simplicity which should make for great reliability in service. The accompanying sketch serves to show the general construction. The ball is securely held in the socket by the plug screwed in the end, and its retaining cotter pin. To avoid the fine pitch threads ordinarily used for similar plugs, requiring a more or less secure clamp to keep them from wearing loose with the constant pounding, and at the same time to provide a close adjustment for wear, a 12-pitch thread, tightly fitted, is used and close adjustment provided by an extra cotter pin hole in the socket case, as shown. This allows an adjustment of 1-12 turn, or 1-144 inch. The sockets are hardened and the buffer springs jappedanned to prevent rusting. Heavy wrought iron pipe, pinned and brazed to the ends, is used for the center member. The reaches are furnished in any desired length.

India Auto Oilstone.—This is the latest addition to the very extensive range of oilstones for special purposes that is marketed by the Pike Manufacturing Company, Pike, N. H. It is intended particularly to replace the use of the file for keeping vibrator contact points in good shape, and as the makers put it, "the advantage of the new automobile oilstone over the file is the same as that derived in the use of an oilstone in the sharpening of a knife, instead of rasping it away with a file, the result, in the case of the file, leaving a rough surface, while the stone leaves the points polished and gives a very smooth contact." Another disadvantage of the file that will occur, even to the most inexperienced autoist, is the unnecessarily large amount of the costly platinum that is filed away, particularly when the points have been allowed to go for such a length of time without proper attention that they have become "pitted." A little regular attention with an India oilstone will keep them brightly polished and in the highest state of efficient working, as much of the skipping and missing of an engine is due to the poor condition of the vibrator contact points, although this is not always the cause that is suspected.

INDIA AUTO OILSTONE AND CASE.

THE AUTOMOBILE

Finishing the Burst of Speed that Proclaimed the Hotchkiss the Star Performer of the Day.

STRAIGHTAWAY sprinting on an average American macadam highway had a renaissance on Hillside avenue, Jamaica, Long Island, Friday, June 5, in connection with the subway opening celebration, that might more properly be termed the inauguration of a new form of road racing in this country. Away back in 1901—November 26, to be exact—Henri Fournier made the first officially timed mile trial in a Mors machine, and set up a record of 51.4-5 seconds. That same day there were other trials by other classes of cars, including, by the way, a run by A. L. Riker in an electric racer. Old timers will remember standing in close lines as Fournier flashed by, missing the ignorant, foolhardy spectators and newspaper men almost by inches. Those trials on the Coney Island boulevard were the forerunners of another sprint meet, which took place on Staten Island on May 30, 1902, over a curved and ungraded course. The fatalities that were the outcome are a part of motor racing history, and resulted in sprint racing in this country being transferred to Ormond Beach. Since the Staten Island races there have been no sprint races to speak of on the public road beyond occasional minor attempts like those at Long Branch, Wildwood and Lowell. It is to be noted that that 51.4-5 seconds mile of Fournier's remained unbeaten until W. K. Vanderbilt, Jr., startled the world with his "39" at Ormond.

There have been annual sprint meets at Nice and Ostend, in

France, and several of lesser note in England, but not until Friday last had any series of straightaway short distance races been attempted in this country. It is a gratifying sign of the times that road contest promoters now look first to public safety, and that it is so generally admitted that the highways must not be used for racing, except when due precaution has been taken to guard the course by soldiers in long distance and by police in sprinting events.

The Long Island Automobile Club, which cooperated with the subway committee in the promotion of the affair and managed outright the racing itself, saw to it that due protective precaution was taken, and the city of Brooklyn backed them up with over 500 policemen and cycle cops, who knew just what they had to do. Enough said. So well did the guards do their work that 20,000 people saw the races with safety, pleasure, and convincing profit.

The course was a three-mile stretch, which was well oiled and rolled. It had two turns, but so gentle as to slow down the cars almost inappreciably. The mile racers had but a single curve to negotiate, and the kilometer sprinters none.

The outcome of the trials was not only a convincing demonstration of the speed possibilities of stock cars, but also an eye-opener to the progress that since Fournier's time has been made in the development of automobile speed. Even though the course, be it repeated, was but an average stone highway, figures

Isotta, Winner of the Stock Car Chassis Event.

Scarcely a Vacancy in the Huge Grand Stand.

were set up that will compare favorably even with those achieved over the famous stretch of sand between Ormond and Daytona.

The king pin of the speeders proved to be the 120-horsepower Hotchkiss, which Elliot F. Shepard drove in the last Vanderbilt race, now owned by Harry Levey, an enthusiastic amateur, who came into the racing game at the last Ormond Beach race. With H. Kilpatrick at the wheel it scored 24 3-5 seconds for the kilo-

Part of the Decorated Parade That Was of Interest.

meter (90.93 miles per hour), 38 3-5 seconds for the mile (93.26 miles), and 1:19 1-5 for the two miles (90.90 miles).

The 20 seconds for the kilometer made by Guinness with a Darracq in France was not touched, nor was Demogeot's 58 2-5 seconds, made with the 200-horsepower Darracq on Ormond Beach, touched, but W. K. Vanderbilt, Jr's beach record of 39 seconds for the mile was beaten on this Long Island road, and

A Bunch of Hard-Working "Scribes" Looking Pleasant.

this best sets an estimate on the value of Friday's performance on Hillside avenue, Jamaica. This gives to Mr. Levey's car and driver American road records at all three distances and world's road records for the mile and two miles. The Ormond steam records for the mile and kilometer, 28 1-5 and 18 2-5, were naturally not approached.

In every event new stock car road racing records were set up to furnish standard marks, to be striven against at the future road sprint meets, which are bound to become popular and run in all parts of the country under adequate military or police protection.

The Isotta followed up its successes at Savannah and Westchester by evolving as the runner up to the Hotchkiss, the latter

The Acme, Winner of the \$1,251 to \$2,000 Class.

a specially built racing car, with a kilometer in 27 3-5, a mile in 42 4-5, and two miles in 1:28 4-5. It is to be noted that both the Hotchkiss and the Isotta were shod with Michelin tires.

The Fiat Cyclone sadly missed the pilotage of the late Emanuel Cedrino. George Robertson essayed the task and secured 30 4-5

Pennsylvania Car That Took Honors in Its Class.

for the kilometer and 46 2-5 for the mile. G. P. Parker, in a stock Fiat, attained a speed of 1:34 for two miles.

The class for four-cylinder cars over \$4,000 attracted much attention. In it the Stearns duplicated its recent Fort George hill climb success by landing four machines over the tape, one, two, three, four, in almost equally fast time.

Jefferson deMont Thompson, the referee, was forced to disqualify quite a bunch of cars in this class for not meeting entry blank requirements, but generously and happily cut the Gordian knot by offering special cups for those he had had to put outside the mast works. The Hotchkiss, Isotta and Fiat finished one, two, three.

The six-cylinder Mora, a make to be seen in the Vanderbilt Cup race, signalized its racing debut by winning the \$3,001 to

\$4,000 class. The Pennsylvania, whose speed was tipped so confidently at Savannah, made good by carrying off the \$2,001 to \$3,000 event. The Acme, another speedy Savannah contender, captured the \$1,251 to \$2,000 sprints. Among the little fellows under \$1,250 there was nothing to it but the Mitchell, which finished first and second. The six-cylinder race went to a Stearns, driven by a private owner, with 1:36 2-5, 45 seconds, and 28 4-5 seconds as its highly creditable string of performances. A Thomas "Six" was at its heels. The stock chassis (301 to 550 cubic inches piston displacement) was a merry scrap, the two miles going to the Isotta, and the kilometer and mile to the Simplex.

Records Might Have Gone to Christie, But—

A car with a record of 35 seconds for a mile made on Atlantic City beach was on hand. Walter Christie had entered his meteoric direct-drive racer in all the free-for-all events, with a very reasonable expectation of gathering with his American-made car the record honors of the day. But Christie is often unlucky at such critical times as these. He was this time. The day before Morton J. Seymour, who made a most noteworthy debut as a racing driver in the Briarcliff Cup contest, and had been engaged to pilot the car, met with an upset 24 hours previous, resulting in the demolition of the radiator.

Stearns That Triumphed in the Six-cylinder Trials.

avenue developed speeds that were entirely unlooked for even by the old-timers, who had in mind all prior performances, and who realized how much more capable of getting over the ground modern cars are than their predecessors of several years ago. Seldom has such a crowd graced what was, after all, a purely

How They Patiently Waited Back of the Line for the Crack of the Starter's Gun.

Though Christie worked all night at the job he was unable to replace it, and so decided to console himself with a waterless try at the kilometer. In a cloud of smoke, and spurting great sheets of flame from the exhausts, the crippled car bore down the stretch in an effort to overcome its handicap and snatch a cup and a record also, perhaps. It was a game try, under a big handicap, and netted Seymour 26 3-5 seconds.

Long Island Automobile Club Manages the Meet Well.

With A. R. Pardington and his associates of the Long Island Automobile Club's contest committee at the helm, the details, as might be expected, were carried out with perfection. The timing was done by Alden L. McMurtry's electric machine, the cars crossing wires connected with it at both start and finish, automatically starting and stopping the watches. S. M. Butler, Charlie Dieges and other members of the New York Timers' Club were on duty.

Fred J. Wagner, as usual, made a good job of the starting. With Harry Clinton, Mortimer C. Reeves and Tom Moon to help him, the cars were sent away so promptly that, despite the prophecy that the great number of contestants would not admit of a trial for all of them at all distances, the races were finished before seven o'clock.

It is safe to say that the Jamaica time trials will go down in history as one of the most successful events of the kind, and there is little doubt but that the numerous new records established on Friday last will require considerable beating before they go down before something faster, as the macadam of Hillside

local event, and chiefly of interest to Jamaica and its environs, and seldom indeed has a gathering of this size, for it was very conservatively estimated that there were at least 20,000 people in attendance along the course, been so well kept within bounds. As the photographs show, the racers had the entire road to themselves, and as it is a broad, level stretch, there was nothing whatever to hinder their progress in the slightest. There was an entire absence of that crowding out upon the course that has become a familiarly objectionable feature at most road events.

Mora Winning the \$3,001 to \$4,000 Class Event.

Vice-President and General Manager Pardington Turns the First Spadeful of Earth.

WITH the turning of the first spadeful of earth at Central Park on Saturday by A. R. Pardington, general manager of the Long Island Motor Parkway, Inc., acting for its president, W. K. Vanderbilt, Jr., who was kept by illness in his family from participating in the formal start of the work on the project so near to his heart, the long dream of automobilism for a stretch of road of its own on which cars may be driven at their utmost speed without danger to the general public is assured of realization.

A simple yet impressive and appropriate ceremonial had been arranged in celebration of an event so momentous to the motor car world, not only of New York but of the country at large. There were a few speeches by men who were well entitled to make them, and then following the tossing of the first spadeful of earth carts invaded the spot, a score of laborers attacked the soil with pick and shovel, and a stick of dynamite blew high in the air an impeding tree. An epoch in automobilism was inaugurated. An example was set which it is safe to predict other cities and populative centers will not be long in following.

Despite the fact that the place chosen to begin the work on the parkway was remote—a spot on the Jerusalem road near Central Park, some 30 miles from Long Island City and five miles from Jericho, on the previous Vanderbilt Cup courses—fully a score of automobilists from New York and surrounding towns were on hand with their cars to participate in the celebration. On a raised platform was a full band, which, previous to the ceremonies, gave a concert. The historic spot was roped in. Fringing the ropes were the automobiles and crowding them were several hundred Long Islanders, who had come afoot to witness the start of a work that will mean much to their prosperity.

Sharp at 3:30 o'clock, the time set for the beginning of the ceremonies, Mr. Pardington stepped to the front of the platform, and in an address all too modest gave more than the lion's share of the glory of the parkway achievement to Mr. Vanderbilt, expressed with emotion his regret that the president of the company had been kept away by serious illness in his family, and begged leave to read a brief address prepared by Mr. Vanderbilt, by way of expressing his feelings on the occasion:

We are here to-day to celebrate the commencement of work on a road, which, when completed, will give to the world one more mode of transportation. There have been in the past highways for all kinds of vehicular traffic, canals for the movement of freight, railroads for the transportation of passengers and trolleys for the convenience of those living in the suburbs of our larger cities, but in no case has the motorist been considered.

Although but a few years in existence, the automobile has come

into such prominence that it has revolutionized all modes of travel. Distance has been eliminated, highways improved, unknown districts opened up, and pleasure given to thousands.

And now the day of the automobile has come. A highway is about to be constructed for its use, free from all grade crossings, dust and police surveillance, and a country opened up whose variegated charms are hard to equal in any part of the world.

We have encountered in our preliminary work of raising funds and procuring right of way many unforeseen obstacles. But land owners in almost every case, seeing what a benefit a road of this character would be to their property, gladly came forward with help, enabling us to complete a forty-five mile right of way.

Then came the panic. Hard times were ahead, and it looked serious for the undertaking. Discouraging reports were circulated, and other difficulties appeared. Nevertheless, with all these trials and tribulations, money slowly came into the treasury, and one obstacle after another was set aside.

So that here we are, eighteen months from the time the company was incorporated, ready to turn over

the first spadeful of dirt, and this fall will see ready for use ten miles of the motor parkway.

Judge William H. Hotchkiss, president of the American Automobile Association, was next introduced as one who had been a great friend of the enterprise from its inception. The judge dilated eloquently on the value of organization, and on the benefits the building of such parkways would be, not only to automobilism, but to the general public as well. He said:

On behalf of the militant motorists of the nation, the twenty thousand who have organized that they might the better combat prejudice and the sooner compel fair treatment, on behalf of yet other thousands to whom a road restricted to automobiles is like a glimpse of paradise, on behalf of all the men who recognize in works like these the seven-leagued boots of Giant Progress, I congratulate you—I congratulate Mr. Vanderbilt, who conceived this enterprise, and you, gentlemen of the Parkway Company, who have assisted in carrying it through; and not the least, believe me, our old friend Pardington, who, six years ago, was in

President Hotchkiss of the A. A. A. Making His Address.

To pierce the ether's high unknown dominions,
To reach new spheres of motor activity."

his time must bide our time. The motor vehicle will remain terrestrial throughout our generation.

So, hail, the first motor parkway! And all hail, those pioneers—Mr. Vanderbilt and his associates—who, for the motorists of America and the world generally, are here blazing the trail for the motor roads, the motor streets and the motor bridges of the present motor age.

The next speaker was August Hecksher, a director of the parkway, also a highway commissioner of Huntington. Mr. Hecksher's theme embraced the wonderful progress in transportation during the past year, notably the building of the East river bridges and the completion of the tunnel all the way from City Hall, New York, to Jamaica. He characterized the parkway as an innovation which would prove almost as valuable to Long Island and New York as the bridges and tunnels themselves.

Milton L'Ecluse, a director of the Long Island Real Estate Exchange, dwelt on the great benefits the parkway would bring to Long Island in the way of attracting not only visitors but permanent residents along its line.

John C. Wetmore, speaking for the New York automobile writers, congratulated automobilism and Long Island that their dream was at last to come true and prophesied that some day the fraternity and Long Islanders would erect a monument on the parkway to its promoters, and that high up on it would be the names of Vanderbilt and Pardington.

The speechmaking was brought to a close by Russell A. Field, secretary of the Long Island Automobile Club, who spoke eloquently of the interest of the club in the parkway, and concluded with a glowing tribute of congratulation to the directors that they had secured one of their members, A. R. Pardington, to manage the enterprise. He said in part:

The beginning of this great boon to the motor-driven vehicle is certainly a welcome day to the Long Island Automobile Club and the newspapers in this vicinity. It will, from the turning of the first shovel of earth, give both something to talk and write about for generations to come.

This is no ordinary project, the inaugural of which we are here to honor and to witness. It is a most extraordinary and stupendous undertaking, the first private and exclusive automobile roadway to be built in the world. The engineers who, after months of research and thought, have worked out the details of this great motor highway, have written a text-book, the coming of which half the nations of the earth, who realize the necessity of such roads, have been waiting.

Before the races for the Vanderbilt Cup Long Island was to many people but a strip of land extending eastward from Brooklyn to Montauk point a hundred miles or more. The International struggles among the best cars Europe and America could produce, brought people to this island, revealed the multitude of its beauty spots, called attention to its advantages, brought desirable purchasers of its lands and good money into the pockets of its citizens. How much more then will the coming of this specially built highway redound to the lasting benefit and good of Long Island. Sixty-five miles of unexcelled going, stretching snake-like from Garden City to Riverhead, over hill and down dale, by lake and river, where the power possibilities and the requirements of safety are the only limitations to speed.

The mind breaks all records in contemplating this scene of motor contentment. Speed is one of the assets of the motor car, of the same relative value as are its other superiorities over all other means of transportation. It is as natural for an owner to want occasionally to speed his machine and perhaps to match it

A Part of the Big Crowd that Witnessed the Ceremonies.

at the birthing of that now thriving body for which I particularly speak, the American Automobile Association.

The occasion is epochal. When, long years ago, the mounted traveler on the public ways gave place to the stage coach, the first English turnpike was constructed—the stage coach road of our great-grandfather's great-grandfather. Then came the primitive steam car, and the man of 1830 thought to build a road to fit the new conveyance. They tried, and failed; the steam car took to the rails, and it now has rail-roads of its own. The roads of the stage coach remain stage coach roads still.

But now comes another self-propelled vehicle, a steam car in miniature, light, easily operated, reasonably safe in mature hands, but capable of great speed. It, too, has taken to the stage coach roads, but, unlike the steam car, it intends to stay there. It needs no rails; the stage coach road, brought up to date, is enough.

Enough, did I say? Not everywhere. In territories such as this—the neighborhoods of great cities and the districts of vast country estates and popular resorts—motor roads, limited to the new vehicle, especially constructed for it, like the railroads' private enterprises of a public nature, have become necessary, and the Long Island Motor Parkway is the first of such roads anywhere in the world. Here, to-day, then, the motor vehicle, as it were, takes to its rails, this parkway becomes the younger brother of the railroad, and the men back of it are as truly pioneers as those who stage-coached on rails behind the "DeWitt Clinton" from Schenectady to Albany nearly one hundred years ago.

The occasion is epochal in another sense. It is prophetic. If motor roads are necessary—and who here will deny it—how soon will it be before we need motor streets? Nay, do you not need them in New York now? And, if streets, bridges; and, if bridges, tunnels and subways? Indeed, the day seems not far distant when our great cities, particularly the metropolis, yielding to the demands of a majority of the people—for, before many years have elapsed, a majority will drive motor cars—will build elevated steel pavements up and down and across their main thoroughfares, over the necessary bridges, and connecting up at their termini with roads like this.

If such be the ultimate of this occasion, not a man here but will look back upon it with pride and gladness that he was present. Yes, even though, peering into the future through the binoculars of the Aero Club, and paraphrasing Faust, he boasts:

"A fiery chariot, borne on buoyant pinions,
Sweeps near me now. I soon shall ready be

Workmen Getting Busy After the Speechmaking Ceased.

Racing Board Chairman Thompson Was Attentive.

against that of his neighbor as it is for a boy to run a race with his playmate, or the horseman brush with his fellow admirer of equine beauty on the speedway.

Users of the public highways have been traveling for centuries in a machine-like, mechanical sort of way, undisturbed, careless and oftentimes stupid in their driving, and it will take some time for them to awaken to the quick thought and keen perception necessary for the successful handling of any vehicle in this era of the motor. Until the time when they shall be so educated automobiles must have special parkways like this where the average owner may drive unhaunted by the specter of hidden speed traps, where the maker may thoroughly try out his creations to determine what points should be improved, where the dealer may demonstrate the stamina and speed boasted in the highly executed catalogues. We shall then realize the difference between 65 and 75 miles an hour. The Parkway may become a missionary of truth. If so, then so much the better.

There is another important phase of this great motor highway on which actual work is being started to-day, that is the practicability as a means of every-day travel from country home to business and back again in cleaner manner and faster time than existing railroads can furnish. The value of the real estate which will be in demand as home sites with the coming of the Parkway cannot be estimated.

The Long Island Automobile Club takes a warm and rather personal interest in the Parkway because the general manager so wisely selected by you is one of the men responsible for the formation of that club. We know A. R. Pardington to be a man among men, with unbounded energy, an unusual capacity for handling details, a beautiful sense of fairness and right, in short, the king pin for such an organization as yours.

It is a pleasure to state that during the preparatory period of the Parkway, when little news of progress was given out, not one of the Brooklyn newspapers ever thought or intimated that

the road would not be built. A. R. Pardington was the general manager. He stated the project would certainly be carried through to completion, and, although readers were periodically served the same initial story with different garnishes, we were confident that such a day as this would come, when the result of his efforts and your efforts would burst into blossom and bear fruit.

The Long Island Automobile Club is as anxious and restless as you gentlemen for the completion of the Parkway. On the minutes of the organization month after month have been spread many questions regarding its progress. The members who have come here to-day will take great pleasure in seeing recorded the fact that the great project has actually been begun.

The Long Island Automobile Club wishes you godspeed in this work, it prays that neither commercial nor financial troubles may interrupt its progress, it sincerely hopes that accidents during and after its completion may be unknown, that success shall crown the efforts of those men who have believed in and loved Long Island enough to make the Parkway possible. These sentiments are, I know, not only echoed by the newspapers, but by every resident of Long Island.

Then once more expressing his regret that the one who should rightly have had the honor was absent, Mr. Pardington drove a nicked spade deep into the sod, the band played, the crowd cheered, and the parkway was started. A rush of carts and laborers within the roped enclosure followed. Picks swung, shovels waved, and a Niagara of dirt fell into the wagons. A loud explosion of dynamite, a cloud of dirt and chips, and a tree had been blown from the parkway's path.

The place of beginning is about the center of an eleven-mile stretch, whose completion is guaranteed by contract in October, in ample time for practice for the Vanderbilt Cup race.

FIRST VANDERBILT RACE FOREIGN ENTRY A MERCEDES

THE first formal entry of a foreign car for the Vanderbilt Cup race has been made. It is a 90-horsepower Mercedes. In fact, it is the same car which Janatzy drove in the last international race on Long Island. Its entrant is Robert Graves, a member of the Racing Board, who has made former entries of Mercedes to these races. The making of the entry was a feature of the visit of the newspaper men and others to Mr. Graves' automobile lodge at Mineola, following the motor parkway inaugural ceremonies on Saturday. At the conclusion of the

Automobile Lodge of Robert Graves at Mineola, Long Island

luncheon the host of the occasion handed to Jefferson deMont Thompson the entry, accompanied by a check for \$1,000 for the entry fee. "I have not named a driver," said Mr. Graves, "but I am going over to the Grand Prix to secure one." I have a bug in my bonnet, by the way, to also enter an American car, for I can see nothing in the rules to prevent making more than one."

Mr. Graves in building this private garage has set an example which may be a precedent among enthusiastic followers of the sport. It is more than a mere garage. It is an exclusive automobile lodge for the entertainment of motoring parties. It will also be a garage for the big stable of racing cars he is to establish at this convenient point, which is less than a quarter of a

mile from the beginning of the parkway.

Reposing against a background of stately green cedars the soft gray concrete walls of this restful retreat are livened up here and there by heavy tile roofs of rich red. The dainty proportions and clean outline of the structure, which is purest Spanish Colonial in design, suggests to the eye of the beholder a gem of pearl in a sea of velvety emerald lawn. Two wings, each a complete building in itself, with sloping tile roofs over their three stories and with further dashes of the same rich deep blood-red in the tile roofs of their gracefully arched porches, are connected by a long stretch of columnar façade, making a spacious car room, with machine room behind.

The west wing of the building is used as living quarters by the owner and his guests, and in the east wing are numerous rooms for employees, a complete stable, and carriage room on the ground floor for casual visitors from across country.

For beauty of design and convenience of arrangement the building surpasses any structure heretofore erected for an owner's private use. The owner's desire was to provide numerous original contrivances which his own ingenuity and extensive familiarity with the machine convinced him as being essential.

From extensive glass skylights over the large car room and machine room the entire garage is bathed in floods of beautiful golden light. There is installed an electric clock, with adjustable time set and switches in the owner's quarters, controlling simultaneously in each guest's and chauffeur's bedroom electric lights and alarm bells for arousing the slumberers to the fray.

CHADWICK SIX FOR THE VANDERBILT CUP RACE

PHILADELPHIA, June 9.—Although it is stated that the makers of the Chadwick car, the Chadwick Engineering Works, had decided to be represented in the Vanderbilt some months ago, official announcement to that effect is just made public. H. B. Larzelere, the company's sales manager, states that the announcement was deferred until an opportunity could be had to show what the Great Chadwick Six could do, this being presented by the recent Giant's Despair and Dead Horse Hill climbs, in which it triumphed in no uncertain manner.

ORPHANS' DAY'S FOUNDERS CELEBRATE

THANKS to the institution of Orphans' Day by the New York Motor Club, the hustling promotion of the affair by Automobile Row dealers, and the added liberality of owners in also contributing cars and money, this greatest of motor car charities was celebrated in this city on Tuesday, with as much success as ever. Fifteen hundred boys and girls from ten of the city's orphanages were given a ride in 150 automobiles and motor

Where the Parade Started on Broadway at 54th Street.

trucks to Coney Island and a whole day of revel at Luna Park.

With the New York Motor Club, the originator of the idea in this country, in a temporary and perhaps transitory trance and Sam Miles, who has been stepfather and head nurse to the little ones at former celebrations, touring in Europe, it looked pretty dark for an Orphans' Day outing in this city this year. "Senator" Morgan, in whose fertile brain this charitable function originated, however, came to the rescue, and, with characteristic hustle, soon had a Committee of Fifty signed to his promotion pledge and a resultant meeting called. The good fellows of Automobile Row responded very generally and promptly put the necessary committees to work in charge of Alec Schwalbach.

Some of the leaders thought it would be an efficient policy, in view of the eleventh hour rush, to put through the affair on a "bluff," based on the number of cars the tradesmen thought they could recruit among their customers. As the day drew near both money and cars were alarmingly lacking, and then appeals and personal canvasses were tried. The old method proved effective and saved the day.

Up to the eve of Orphans' Day, however, though Automobile Row had contributed its cash as well as cars liberally, the food

problem faced the committee. Who was to supply the luncheon, as Sir Thomas Dewar, George Kessler and Col. Clifton had done at the three previous celebrations?

Late Monday afternoon, however, a Baron Bountiful was forthcoming. Ray M. Owen, sales agent for the Reo and Premier, called up headquarters, inquired into the finances, and offered to stand treat himself to the 1,500 little ones.

At ten o'clock the four streets from 54th to 57th west of Broadway were filled with automobiles and motor trucks filled with happy, laughing boys and girls, packed away like sardines in a box, so that as few as possible would have to be left at home. In fact, 150 larger children were sent down to Luna Park by the subway and elevated lines. Half an hour later the parade got under way down Broadway, across 48th street to Fifth avenue, and thence to the Bowery. At Mott street ten cars bearing 150 Italian orphans joined the procession and went with it across Williamsburg Bridge, through Prospect Park and down the

At Coney Island the Youngsters Had a Glorious Time.

Coney Island Boulevard to Luna Park, whose management threw open its gates free to the children.

After a hearty luncheon the orphans stormed the many shows, shot the chutes, slid the slides, and saw the sights of the wonderland of which for weeks they had dreamed.

And yet there were close to ten thousand of the little ones left at home because but 150 of the 10,000 automobile owners of New York thought it worth while to give the city's orphans a ride in a motor car and a day at Coney Island. Ask the 150 whether they got their reward.

THOMAS PROTESTS PROTOS AND DEMANDS THE CUP

ALTHOUGH matters have been considered as settled by the decision of the French committee to allow the German car to continue with a 30 days' penalization, no objection to the decision of the committee having been made at the time it was promulgated, the Thomas company has filed a further protest against the German car, on the ground that, in view of the much greater mileage covered by the Thomas, it is not fair for it to compete against the German alone. A formal demand for the cup is accordingly made by E. R. Thomas.

Late advices from Pograditch, via Nikol'sk, Siberia, received by the *New York Times*, show both of the remaining competitors to be having a pretty strenuous time of it. The

Protos was wrong side up at the bottom of a gully after it had taken to the road, through being forbidden to further use of the railroad right of way, and the Thomas was proceeding on the tracks with a railroad official, followed by a hand car carrying a telegrapher, a crew of coolies and a supply of planks to bridge unballasted stretches. This was after a three-day delay caused by the Thomas stripping its driving gears through running over unballasted ties, Schuster having to take the train to Harbin for replacement parts. Grand Duke Serge Nicholovitch, one of the Russian committee, has just been through the territory now being traversed by the cars, and has ordered that every assistance be given them.

LUBRICATION ON THE MODERN AUTOMOBILE

By ARTHUR H. DENISON.

IN the modern gas engine there are moving parts subject to very high temperatures and pressures, and this has naturally brought about the development of lubricants suitable for these conditions. Lubricating oils are one of the products of crude oil or petroleum, either volatilized by the action of heat or separated by other methods. The operator of a car does not need to know the chemical composition of oils or the refining operations necessary to their manufacture, yet knowledge of the necessity for oils, and the many places where they are needed is

Fig. 1—Section of crankshaft for four-cylinder motor, having five main bearings, and showing one method of drilling shaft to lubricate connecting rod bearings.

absolutely necessary to insure the auto's successful operation.

The primary value of an oil is its ability to keep the two surfaces it is intended to lubricate separated, thus reducing friction. Friction is present in all moving objects and in machinery is due to minute irregularities in both surfaces, which, when viewed under a microscope, seem rough like files. Extracts from the laws of friction that need to be considered here are, "Friction varies with pressures, increases with the roughness of the surfaces, and is diminished by polishing or lubricating the surfaces. Considering the law—"Friction is diminished by lubricating the surfaces;" a suitable oil will both fill the minute irregularities and maintain a film between the two surfaces, preventing them from actually coming in contact. There is always pressure on a bearing, and the effect is a tendency to separate the molecules of the lubricant, forcing enough out from between the surfaces to allow the metals to come in contact. The value of an oil, therefore, is its ability to resist the tendency to be forced out of the bearing. In opposition to this tendency to separate the molecules is the force termed cohesion, or in oils, viscosity, meaning the attraction of one molecule for another; consequently the higher the viscosity of an oil the more suitable it is in bearings subject to heavy loads.

Friction always generates heat and an increase of one degree causes a proportionate increase in volume, the molecules of the substance being driven further apart and the force of cohesion lessened. If the temperature is raised sufficiently and the substance vaporized, the force of cohesion is overcome entirely. The manufacturer of oils to-day provides different grades for almost each class of work. Oils intended for use in machinery, such as sewing machines, bicycles, guns, etc., are not subject to heavy loads or heat, therefore, the composition of the oil is determined with regard for these conditions. Oils for steam engines must withstand the temperatures and pressures of steam, that of saturated steam, or of steam in contact with water, is about 225 degrees F. The flashing point of these oils is so low that when subject to the temperatures of the gas engine they would be readily decomposed.

Oils of High Flash Point Are Required.

The temperature of the burning gas, during the time combustion is in progress, is estimated at 2,500 degrees F. and upward. The melting point of cast iron such as the material in the cylinders is between 2,200 and 2,300 degrees F. On the other hand, the oil and cylinder walls are subject to these temperatures for a very short period of time, in a motor of 5-inch stroke, running

at a speed of 600 r.p.m., the length of time the maximum temperature would be maintained is approximately 1-40 of a second.

Taking into consideration the cooling influence of the water jacket, also that of the gas introduced on the suction stroke, the average temperature of the cylinder walls is estimated at about 500 degrees F. Fluids are poor conductors of heat, consequently the oil film on the cylinder walls protects the cylinders to a certain extent. The best temperature of the water, in water-cooled engines has been ascertained to be about 210 degrees F., and this would leave the mean temperature of the cylinder walls about 350 degrees. The fire test of a good lubricating oil should be at least 400 degrees F., so there is a reasonable margin of safety. The water-cooling system is not intended to keep the motor cold, merely cool enough to preserve effective lubrication, and any surplus oil is burnt off and passes out with the exhaust gases, becoming visible as white smoke on being discharged into the atmosphere. The expansion of pistons and cylinders due to friction is not taken into serious consideration, the pistons being machined small enough to allow for expansion due to the temperature during combustion, and the elasticity of the piston rings is sufficient to take care of anything short of overheating.

Carbon, which enters largely into the composition of oils, is separated by the action of the intense heat and is deposited on the walls of the combustion chamber, plugs, etc., therefore, using an excess of oil causes various forms of trouble. The carbon becoming incandescent, may fire a charge of gas prematurely, causing excessive strains on the piston, piston pin and crankshaft. The motor will also pound, giving a sound similar to that when the spark is advanced too far with the motor running slowly, and under a heavy load. The ignition plugs will be fouled or short-circuited and the motor is liable to overheat. Considering, finally, the length of time needed to make proper adjustments, and that of clearing the cylinders of the carbon deposits, there is no reason or excuse for having a car in every day use smoking like a locomotive. To insure sufficient oil reaching the cylinders, a groove is usually turned in the cylinder walls, at a point low enough to prevent oil being taken directly into the combustion chamber. Shallow oil grooves, turned in the piston, or a ring placed below the piston pin, pass this every stroke and carry up a certain amount of oil, depositing it on the cylinder walls, the upper rings then collecting and carrying it to the top of the cylinder.

Poor Lubrication Affects the Compression.

The oil working into the minute irregularities between the piston rings, their grooves and the cylinder walls, has much to

Fig. 2—Section of crankshaft for four-cylinder motor, having three main bearings, and showing method of drilling crankshaft to lubricate connecting rod and bearings.

do with the ability of the piston to hold compression, especially if the rings or cylinder are somewhat worn. This will be noticed by the driver who has given the cylinders a bath of kerosene to clean them. It will be found that the compression will leak out very much quicker than when the cylinders have plenty of oil. Some manufacturers using quantities of oil in the oil-pan have found it necessary to put baffle plates at the bottom

of the cylinders, leaving room for the movement of the connecting rod, and yet found that plenty of oil reached the cylinder walls. Without the baffle plate so much oil was taken into the combustion chamber that the motors constantly emitted a dense smoke, and were bothered a great deal with carbon deposits. The usual location of the camshaft is in the crankcase so that oil is splashed on it by the connecting rods. If placed there it never needs attention so far as oiling is concerned. Some designers place it in a separate compartment and fill this with oil or grease but this system has no particular advantage.

The connecting rod and crankshaft bearings must be provided with plenty of lubricating oil and it is common practice to use one grade of oil in the engines. There is a pressure on the piston and transmitted directly to the crank shaft, at the beginning of the power impulse, of between 10 and 18 atmospheres, depending on the amount of throttle opening, and the oil must have sufficient viscosity to maintain a film between the bearings and crank pins that will cushion the sudden force of the explosion. Here the expansion due to friction is very important and the design must provide for sufficient lubrication, also sufficient bearing surface so that the heat generated may be readily dissipated. If the bearings run hot, the crankshaft becoming heated must expand, likewise the bearings, and the two expanding uniformly in all directions, will grip each other much tighter, using much more power and either shaft or bearing will be badly cut. If the heat is increased to the danger point the bearings will be burnt and connecting rod or crankshaft is very liable to be broken.

How the Lubricant Reaches the Bearings.

Figs. 1 and 2 show two different methods of drilling the crankshaft to convey the oil to the crank pins, and it will be noticed that the oil holes discharge at the highest point of the revolution, corresponding to the position of the piston at the beginning of the power or firing stroke. The supply is received by the main bearings from the oil pump and the oil hole in the shaft, coinciding with that from the oiler has a little oil forced in each revolution, and generating centrifugal force throws it rapidly through the passages. The majority of modern motors are equipped with splash lubrication and have the connecting rods dip into the oil each revolution and splash it all over the inside of the crankcase. Some types are equipped with a scoop pointing in the direction of rotation, at the lower end of a passage connecting with the crankpin. The oil is sent into these passages with considerable force, owing to speed of rotation, thus assuring sufficient oil to the connecting rod bearings.

This is worked to the ends of the bearing and thrown off in the shape of a fine mist that penetrates to every part of the crankcase. The oil splashed onto the lower cylinder walls and not carried up by the piston is caught in little troughs, cast in the crankcase and drilled so that the oil runs down to the main bearings. In addition to the pipe from the oiler, the better designs provide an oil wick or an oil ring or chain, all types carrying oil from a shallow pocket corded in the bearing cap, the wick by capillary attraction and the ring or chain, revolving with the shaft, their lower ends immersed in the oil will carry up a considerable quantity that will spread over the shaft. This oil ring system is used very successfully in electrical machinery. With a splash lubrication it is advisable to drain the crankcase at frequent intervals, and put in a fresh supply of oil.

The modern ball-bearing gear box requires but little attention. Periodic filling with suitable lubricants is sufficient. On chain-driven cars the gears and differential are usually exposed by lifting one cover. On shaft-driven cars the differential and rear axle system requires a certain amount of attention, as too much oil in the differential is liable to leak through the axle sleeve and hub, usually getting on the brake drums. If this happens, the best thing to do is to jack the wheel up and squirt gasoline on the drum, slowly revolving it meanwhile. Manufacturers usually put a plug in the differential case showing the proper height at which to keep the oil level. The gear box

should be kept a little less than half full. If too much is put in, the oil will be thrown out of the shaft and bearing housings, but a little leakage does no harm as there is always dust present and the oil leaking will serve to fill the crevices and make the case dust tight. In regard to the wheels, universal joints, clutch, and many little places about the car, all need attention occasionally.

Care in Oiling Is a Prime Necessity.

The wheels should be cleaned and packed with grease once or twice a season. Universal joints at intervals necessarily shorter. Latest designs provide for their lubrication through the shaft from the gear box. Earlier types are best packed in grease and enclosed in a leather boot. On many shaft-driven cars, where the shaft runs through a sleeve, daily attention should be given. The lack of a few drops of oil may rob the car of 50 per cent. of its power. Multiple disc clutches use oil or an oil and kerosene mixture, and the tendency seems to be for the oil to gum. Their action when slipping or dragging is sufficient indication as to when they are in need of attention. Leather-faced clutches will work much better when cleaned with kerosene and given a dose of neatsfoot or castor oil. The oil should be spread over the surface of the leather by using a long knife blade, or by running the motor for a few moments with the clutch released. When treating the clutch leather this way it is

Fig. 3—Continuous circulation oiling system of Pierce Arrow. The oil flows from the crankshaft into the oil well B, and is pumped from there into the tank A, at the cylinder heads. It flows by gravity to the main bearings, and oilways drilled in the crankshaft to the connecting rod bearings. The oil pump, not shown, is at C. D is a glass showing height of oil in the reservoir.

better to let it stand over night if possible, and with the emergency brake lever, or a block of wood against the pedal hold the clutch disengaged. A hand oil can with a long spout is almost indispensable, and the starting crank, the steering pivots and connections and the spark and throttle connections, gear control and emergency brake levers, clutch and brake pedals, shafts and connections and the fan bearings will all work much quieter and sweeter for a few drops of oil regularly. It is the practice of drivers to fill the oil can from the cylinder oil supply and this practice is to be commended, as many lower grade oils contain acids strong enough to etch steel.

Here is a quick and simple method of oiling driving chains when touring, or in a hurry. Fill an oil gun with oil and direct the stream of oil out of its spout so it will fall on that section of the chain stretched between the top of the sprockets, and so the oil will reach each link. This is easily accomplished by varying the pressure on the piston of the oil gun. The links on the sprockets may be reached later and the oil on the free links will drip off and in falling will strike the lower section of the chain, thus lubricating its links. Driving chains when dry will make a disagreeable noise and often cause a jerky motion of the car that may be easily misunderstood as something serious.

The best method of lubricating chains is to clean them thoroughly in kerosene, then boil in a preparation of graphite and tallow that can be bought for this purpose. By this method, the grease is driven into all joints and will last longer, and by keeping the dirt out, will reduce the wear. After removing the chain from the lubricant the surplus should be removed with a cloth. The timer should be cleaned with kerosene or gasoline at regular intervals, and a little oil or thing grease put in. Graphite, which is not affected by temperatures of 2,000 degrees F., may be used to good advantage in many places, though it must be handled carefully, as there is danger of clogging the passages. It is very beneficial in the cylinders, filling the pores of the iron, and it preserves its lubricating qualities indefinitely. When using it the manufacturers' instructions should be followed closely.

Various Methods Employed on Automobiles.

The history of lubricating devices shows the use of many different types—individual oil cups with gravity feed, reservoirs with the oil flowing by gravity through sight feeds to the motor, some controlled by hand—and the operator's memory—others interconnected with the switch. Exhaust pressure has been used quite extensively in four-cylinder vertical motors, and crankcase pressure in the two-cylinder horizontal opposed type. Current practice now indicates a tendency among designers to use systems that may be trusted absolutely and to that end many of the better cars have force-feed oilers with either gear or flexible shaft drive. The steel spring belt and leather belt drives seem popular, but chains do not seem to be used very much. The latest system coming into general use is a continual circulation system. An oil level in a crankcase is maintained by means of bores drilled at a certain height, the extra oil flowing through these holes to an oil well.

It is drawn from here by an oil pump and forced to the cylinders or main bearings, and the unused oil dripping to the oil pan and from there to the oil well serves to keep up a continual circulation. Another design somewhat similar, pumps the oil to a tank near the cylinder heads, and it flows from there by gravity to the main bearings. These systems are very reliable and are usually provided with some means of ascertaining the amount of oil in the reservoir. The oil circulated practically similar to the water in the water-cooling system does not require the daily attention and filling of tanks that the other systems require. The oil gradually loses its lubricating qualities and after running some time it is advisable to drain the old oil off and put a fresh supply in. The makers' instructions will give necessary information in regard to the mileage on one filling. Splash lubrication is provided for on all but a very small percentage of American cars, without regard to the system used—whether force-feed or continual circulation. Many high-powered cars are fitted with a reserve oil tank holding from one to three gallons, and on some cars the tank and the method of raising the oil to the oiler could be greatly improved.

American Cars Show Great Diversity of System.

There are no fixed rules in laying out a lubrication system. One American car, with a motor developing nearly 60 horsepower, has two sight feeds, feeding the crankcase only and depending on splash lubrication altogether. Another high-grade car, rated 50 horsepower, has a gear-driven oiler on the dash with ten feeds, four to the cylinders, five to the main bearings and the tenth to the timing gears. The majority of cars seem to use from four to eight feeds. Fig. 4 shows a method of oiling the cylinders from one feed and distributor and insuring an even supply of oil to each cylinder. The same system may be applied successfully to the main bearings and the maze of pipes seen on some cars thus done away with. This method would not preserve the value of the pressure feed to each point, though the pressure from the pump would be present to the discharge point.

Designs have shown both extremes. One high-grade car ap-

Fig. 4—Diagram showing distributor to oil cylinders. The oil pump forces the oil into the long tube, and from there it rises vertically an inch in order to insure equal pressure on the connections to each cylinder. Placing check valves at the top of this short vertical pipe would be good practice, but it is not absolutely necessary.

peared on the market with oil pipes, sight feeds, reservoirs, pumps, in short everything pertaining to the oiling system that could be placed on the dash was there, then other models have been brought out with only a button for stopping the motor by short circuiting the ignition current. It will be noticed that the majority of cars with an oiler on the dash show plainly the effects of the oil leaking, rotting the rubber mats and soiling anything and everything it comes in contact with. Modern oilers have been developed to such a stage that they may be almost absolutely relied upon, and there is no reasonable excuse for their presence on the dash. It is of interest to no one but the driver and he has plenty of opportunities to test or watch its working if placed in its proper place—under the hood. Compression grease cups are used to advantage on many cars with the camshaft, and rocker arms at the cylinder heads, but the grease cups employed have usually been of small sizes, either 3/4 or 1/2 inches in diameter. The smaller sizes in particular are very inconvenient to handle, as they are built with a flat head, and the edge knurled to allow the fingers to grip it. Were the manufacturers to design these plain types so that the head was slotted to allow the use of a screw driver, it would be quite a big improvement.

Conversation with the foreman of the assembling and repair department in a factory recently brought forth the following: "Most of the steering gears we have overhauled were in a condition that seemed to indicate that they had not received oil or grease since they were assembled in the factory. Lubrication is always provided for, a small plug or screw closing the oil hole. The steering gear (worm and sector casing) should be filled with grease at short intervals. Ball-and-socket joints on the steering connections will give best results if enclosed in leather boots, filled with grease."

Detecting the Poorly Lubricated Motor.

Oil leads should be cleaned out occasionally with gasoline, compressed air or steam, the latter being the best. A motor properly lubricated will not stop at once when the ignition is cut off. It should turn over several times, depending on the energy stored in the flywheel, and after the last complete revolution has ended the flywheel should swing backward and forward a few times before coming to rest. Were the cylinders taken off the pistons would be found on the same horizontal

Fig. 5—Principle of oil ring. A, shaft; B, bearing; C, oil ring; D, oil. The oil chain is very similar, the flexible links conforming to the contour of the shaft for the upper half of its circumference.

plane (or very nearly so). If the motor stops quickly with a slight jerk, it is either very stiff or dry; stiff if the bearings have been taken up very recently. To get the best results the oilers should be adjusted so that when the motor is running at medium speeds, very faint traces of smoke should appear, vanishing at a distance of six to twelve inches from the end of the muffler discharge pipe. This adjustment will be readily found after a few trials. If in any doubt as to whether the motor is getting enough oil or not "open" the oil pumps so that more oil is fed. Better too much than too little always, and with modern systems it is hard to get an excessive amount for the reason that the speed of the oiler is in the proper proportion for the motor.

Many oils contain acids that will etch steels readily. The following is recommended as a test: Soak a piece of waste in the oil and wrap around a piece of polished steel, and place in the sun. If there are acids present the face of the steel will reveal their work in an interval of from a couple of days to a week, depending, of course, on the strength of the acids. This is another reason why only the best oils should be purchased, whether used in the cylinder or the oil can.

The manufacturer of your car has used plenty of oil in running the motors in, and the shop and road tests. He is constantly experimenting with new oils that are sent him by the refiners to be thoroughly tried before they are placed on the market as suitable to his motor. He issues an instruction book that contains explicit directions in regard to the amount of oil to be used, also information about oiling the wheels, transmission system, etc., in some cases going as far as to paste a copy of oiling instructions on the framework of the body where it must be seen every time that the gasoline tank is filled. This also recommends the use of well-known oils, all perfectly adapted to the places they are intended to lubricate. When touring carry a spare gallon along with you, and if you should run short and cannot get your usual grades, insist on being furnished with a standard make of oil as near like your regular grades as possible. Buy the best you can get. You may save a few cents per gallon by using a cheaper grade of oil, but it would take the savings on a great many gallons to cover the expense of having your cylinders rebored and pistons or rings replaced.

AN INSTANCE OF ACCURACY REQUIRED IN CONSTRUCTION

By J. T. GRIMSHAW.

It is only those who are engaged in the most important positions in an automobile factory who understand and appreciate the mechanical refinements necessary to the production of duplicate parts. The proverbial hair's breadth is no fit simile for

as to hold sixteen $\frac{5}{16}$ -inch steel balls with $\frac{3}{32}$ -inch to spare for clearance; that is $\frac{3}{32}$ -inch divided by sixteen (the number of the balls) equals about $\frac{1}{10,000}$ in an inch clearance for each ball, permitting its free running in the race.

Fig. 3 shows an indicator with the front plate or guard left off. It consists of two $\frac{5}{16}$ -inch steel balls, same as used in the bearings fitted and soldered with soft solder (so as not to draw temper from the balls) to two sheet metal pieces, one of which is fixed rigidly to the back or main plate; the other is hinged onto a taper pin screwed into the same plate with a jam nut in the back. The pointer of the indicator is hinged in the same manner, the movement of the pointer on the graduated scale being approximately 63 times as great as any existing error in the ball races.

Figs. 1 and 2—Section and plan views of ball thrust bearing.

the accuracy commonly required. The average diameter of a hair from a human head is about one and three-quarter thousandths of an inch, and there are a multitude of automobile parts which if finished that much too small would be consigned to the scrap heap, or if that much too large, would have to be gone over again and brought to size.

Below are shown drawings of a device used in a large automobile factory for the production of absolutely duplicate ball thrust bearing races. Fig. 1 is a section, and Fig. 2 is a plan view of one-half of a ball thrust bearing. In such bearings it is absolutely necessary that the ball races be as near alike as mechanical skill and ingenuity can make them. That is to say, suppose the discs A and B were laid separately with their races uppermost and a set of balls placed in each, the distance from the center of any ball to the center of the ball diametrically opposite to it must be the same in A as in B, as shown in Fig. 1. The discs are tool steel hardened and ground to size, and the size of the races such

Fig. 3—Instrument for detecting errors in ball races.

It will be seen, therefore, that these races will be remarkably accurate, when it is remembered that the operator is allowed no leeway, but must finish exactly to size with the indicator at zero, representing almost mechanical perfection, and this is only one of the many instances where the same accuracy is required.

LETTERS INTERESTING AND INSTRUCTIVE

WHAT IS BAD PRACTICE ON THESE TWO POINTS?

Editor THE AUTOMOBILE:

[1,406.]—There seems to be a diversity of opinion among intelligent autoists as to the advisability of the use of graphite in the crankcase. Some advise mixing a teaspoonful of flake graphite with every quart of cylinder oil put into the crankcase for the purpose of lubricating the cylinders, saying it will give a fine surface to the inside of the cylinders if so used. Others say it is a very bad practice, as it will cause the pistons to bind. (See Automobile Catechism, Sec. 189.)

Again, in case the chain breaks on a chain-driven car, the "Automobile Catechism" says: "Fasten the sprocket at the end of the countershaft from which the chain is gone. The car then can be driven home by the other chain. (See Catechism, Sec. 274.) To this some say it is bad practice; better draw your car home, as the strain on the differential gears is too severe.

Meriden, Conn.

GEORGE A. FAY.

We understand that graphite is very successfully employed as a lubricant on the automobile and tests have shown it to be highly effective for some of the numerous special conditions to be found on the power-driven vehicle, but, like everything else, this is something about which many of the experts and "near experts" hold entirely opposite opinions. The experience of a few autoists who have used it in this manner should go further toward settling the matter than a great deal of theory, and we invite those who had occasion to use this lubricant to give their opinions as to its value for the purpose.

Driving the car by a single chain naturally imposes a very severe strain on the differential, but if properly carried out there is no reason why it cannot be done without causing any injury to the car, particularly where a long tow home is the only alternative. Flood the differential with oil before attempting to subject it to the extra strain and drive slowly. A little care will avoid any chance of injury as well as the tow. Where some distance is to be covered it would be well to examine the differential from time to time and keep the supply of oil replenished, as this will save it.

GEAR RATIO FOR A LIGHT FRICTION DRIVE.

Editor THE AUTOMOBILE:

[1,407.]—I am rebuilding a small automobile which will be driven by a "one-lunger," 3 1-2 bore and 3 1-4 stroke, making from fourteen to eighteen hundred r.p.m. Transmission is to be through a friction drive by a single chain to the periphery of the differential. The friction disc and driven wheel of the transmission are each twelve inches, and the wheels of the car are twenty-six inches.

Will you kindly advise me what size sprocket to use on the jack shaft, and also on the differential. I find your department "Letters Interesting and Instructive" of great assistance to me.
New York City.

J. HALLOCK WARING.

As your motor will naturally have to run very fast when developing its normal power, and as the friction driving gear you mention permits of the driven wheel being revolved at a very high speed, it will be necessary to use an extremely low gear ratio. For instance, with sprockets of the same size on both countershaft and differential, the latter would be turning at the rate of 1,800 r.p.m. when the motor was running at the same speed, assuming that the percentage of slip in the friction gear is practically negligible at this high speed. As a 26-inch wheel covers 6.8 feet per revolution, this would mean a speed of better than two miles per minute, again assuming the motor and transmission to be capable of driving the car at that rate. We should advise making the forward sprocket either 5 or 6 tooth and the rear sprocket 36 tooth, making a reduction of 6 to 1 in the latter case or 7.2 to 1 in the former. This would give the car a maximum speed of slightly over twenty miles per hour with the 6 to 1 gear and about eighteen miles an hour with the lower gear; the motor will probably not be capable of more.

ELIMINATING THE NECESSITY FOR POLISHING.

Editor THE AUTOMOBILE:

[1,408.]—Kindly advise me through "Letters Interesting and Instructive" if there is some substance known to coat brass on a car, so you won't have to polish it.

I have a 1908 four-cylinder Model 10 Buick. Would a magneto give satisfaction on such a car, do you think?

Gordon, Neb.

L. H. JORDON.

An attractive green finish may be given the lamps by the use of a solution of acetate of copper, or carbonate of copper, or by using a mixture of the two, according to the tint desired. The chemicals, familiarly known as "verdigris," are mixed with a light varnish and applied with a brush. While still wet the high parts are wiped off with a rag dipped in the solvent of the varnish, which will probably be found to be alcohol. After the process of applying this color has been finished, it must be allowed to dry hard and then a coat or two of transparent lacquer is put on for protection. This will give a finish that does not require any polishing as long as it lasts, which will depend upon the amount of rubbing the lamp is given to remove mud, etc., as well as the weather. There are a great many variations of the process described, but none of them are absolutely permanent where subjected to the weather. To obtain a permanent finish for such conditions electro-plating is required.

LENGTHENED WHEELBASE IS AN IMPROVEMENT.

Editor THE AUTOMOBILE:

[1,409.]—In letter No. 1,383, a writer inquires about a Darracq car with a lengthened wheelbase. I have used a car of the same make and possibly the same model for three years. After getting thoroughly tired of using a car when the rear wheels carry the entire passenger load, I lengthened the body 10 inches, and the wheelbase 18 inches, and changed it to side entrance. It is not yet completed, but it is a sure improvement.

Wakefield, Mass.

E. I. PURRINGTON.

As stated in the answer to the letter referred to above, the short wheelbase was one of the most radical defects in the designs of cars that appeared prior to 1904. The car with a very short wheelbase is almost unmanageable above a certain speed, and does not steer well at speeds as low as twenty-five miles an hour, while it has a most disconcerting habit of "spinning" around on the road when the brakes are applied suddenly while moving at a good rate of speed. The way some of the old cars would "cavort" under such circumstances, particularly if the road happened to be at all slippery, was enough to make the driver's and passengers' hair stand on end, and doubtless such conditions often led to the car's overturning. Apart from the extra comfort of the side entrance tonneau, lengthening the wheelbase is an improvement that is highly appreciated by anyone who has had experience in handling a short car.

SOME INTERESTING FIGURES FROM ABROAD.

Editor THE AUTOMOBILE:

[1,410.]—"Another Illusion Gone" is the heading of an article in a well-known motor trade paper, and refers to the fact that the French, the pioneers of the pleasure motor car, are, from a motor manufacturer's point of view, in a very bad way, with their exports rapidly declining, and their faults too long glossed over by their early reputation now exposed to public view, with the result that most French cars have fallen in reputation and orders.

The reasons for the collapse of French motor cars are various, but may be set under the following headings:

1. Lack of knowledge of foreign trade requirements, and inattention to customers' complaints and orders.
2. French manufacturers under-estimated the strength of the motor movement in countries other than France.

They believed themselves the leaders, whereas statistics recently published show that Great Britain has the greatest number of motor cars in use, viz., 79,000. Germany over 36,000, and France only

about 34,000; as a matter of fact, if the world was taken, I find France would only be fourth and not third, as America has certainly nearly as many in use as Great Britain, if not more, so that France, from being the pioneer in the manufacture and use of motor cars, has now fallen into the fourth position, and Great Britain as a user of motor cars has left France far behind.

The net result of this is that French manufacturers have much fewer orders than usual this year, and as far as I can find from inquiries there are only one or two French firms that have increased their British business at all, and probably the reason why one of them, namely, De Dion, has done so is because the manufacturers of the De Dion cars have had the advantage of an English company to advise them, and considering the multitude of their orders, British advice was apparently worth following. On the other hand we see some British firms, even in this year of financial crisis, increasing their business and actually selling more cars than ever before.

In powerful motor cars the British six-cylinder principle initiated by Mr. Napier shows a progress this year greater than ever before.

The number of six-cylinder cars sold since October 1, 1907, to April 20, 1908, being 37.6 per cent. greater than last year, and the orders still in hand to be executed within the next two or three months show 98.3 per cent. in advance of the same period last year.

The whole matter interests me greatly because at a dinner held on February 28, 1906, I set out clearly that the French motor car trade was on the decline; since then it has looked better than it really is, by reason of the imports to this country of French motor buses and motor cabs, but the next six months will see such a falling off as will once and for all establish the fact that British cars are best to sell to motor car users in this country.

London, Eng.

S. F. EDGE.

While Mr. Edge's observations are doubtless the result of personal experience in sizing up the situation in the far-seeing manner for which he is noted and are of considerable interest as showing the view taken of the British market for Continental machines by one who should be in a pretty good position to know, his figures are rather misleading, at least where the number of cars in use on this side of the water are concerned. As an instance of this, it may be cited that the registration figures for the State of New York alone—but one of the almost fifty States in the Union—are now close to 53,000, and as these figures have advanced more than 20,000 in the past two years it is safe to say that 30,000 would be a conservative estimate of the number of cars in use in this State. Probably the figures published in *The Car* recently, in which the United States are credited with 130,000 cars in use, are more nearly correct and will be found to err in being too conservative if at all.

WHAT IS THE CAUSE OF THIS MYSTERY?

Editor THE AUTOMOBILE:

[1,411.]—Will you kindly suggest through "Letters Interesting and Instructive" the probable cause of the following trouble with my Maxwell two-cylinder touring car? Ignition good, batteries show 14 amperes, mixture seems good, engine starts on first compression and runs all right for about an hour, then seems to get pretty warm, but radiator water does not boil. Suddenly engine slows down and stops. Has to be cranked several times before it will start again, then goes on without further trouble. Always does this after being run about an hour. Carbureter thoroughly cleaned, also gasoline strained. Circulation pipes to radiator were found somewhat reduced by deposit, which probably caused heating, but why should engine stop from this cause? There is no seizure, as engine cranks readily.

Hendersonville, N. C.

W. S. OSBORNE.

Just why the motor should stop at the end of an hour, or any other definite period, and then resume and run continuously thereafter without any trouble, is as much of a mystery to us as it is to you. A motor will frequently come to an unexpected stop after running a short time and cranking will immediately restart it, but this is often due to a temporary failure of the fuel supply that the short stop permits to right itself. Under the circumstances we would only be hazarding a guess at what the probable cause of your trouble may be and we think there are a great many of our subscribers who find themselves in a position to do something more definite than this, so we will put it to them to answer.

QUERIES ABOUT STEEL AND LUBRICATING OIL.

Editor THE AUTOMOBILE:

[1,412.]—What kind of steel should be used for the pin in a steering knuckle of the Elliott type? Does a colorless oil contain less to carbonize than a dark oil?

A SUBSCRIBER.

Aurora, Neb.

The best steel procurable is none too good for any part of a steering gear. Better write the makers for a replacement part, rather than use ordinary material for making it, unless you have facilities not enjoyed by the average autoist, in which case it is advisable to employ either a good alloy steel, showing high tensile strength and yield point, or a good quality of low carbon steel, in case the alloy steel is not procurable. Tool steel should serve the purpose well. A colorless oil is said to possess this characteristic, but we have never had any personal experience of the kind.

REVERSING POLARITY OF A STORAGE BATTERY.

Editor THE AUTOMOBILE:

[1,413.]—What effect or damage would occur if in charging a 6 volt 60 ampere storage battery the wiring should be reversed, that is, the positive wire of the charging set be placed on the negative binding post of the battery and the negative wire of the charging set to the positive binding post of the battery? If any damage should result, how would you remedy it?

J. S. KARNEY.

Clinton, Ind.

The formation of the plates would be changed from one chemical composition to another by the charge, and usually the battery would be ruined. We think the most advisable thing for the average autoist to do would be to return the cells to the maker with a statement of what has been done. At least, it is our opinion that this would be the most economical and effective way of remedying the trouble.

ABOUT THE ONE-CAR 24-HOUR RECORD.

Editor THE AUTOMOBILE:

[1,414.]—Please inform me what the world's record for 24 hours' continuous running on a one-mile track by one car is. I have seen two claims, the National, 1,094 3-16 miles, and the Renault, 1,079 miles. Did Edge use more than one Napier in his 1,581-mile record on Brooklands?

Milwaukee, Wis.

INQUISITIVE.

We believe that the record of the National still holds good for a 24-hour event on a one-mile track, using the same car driven by one man. Edge only used one car in making his record at Brooklands, but two or three other cars of the same make raced with him for the entire period.

ANOTHER GOOD WAY TO PREVENT TAMPERING.

Editor THE AUTOMOBILE:

[1,415.]—In a recent issue of your paper, I noted an article regarding the locking of a car by locking the clutch-pedal in such a position as to disengage the clutch. I find the following a very effective way of preventing my 1907 Stoddard-Dayton being used without my permission. I cut an electric snap-switch in on the ground wire to the commutator and fasten the switch to the dashboard under the hood. Then by simply turning off the switch, putting down the hood, and fastening it, and locking a padlock through the fasteners, one on each side, the car is effectually locked, and yet it can be moved around the garage, as is sometimes necessary. My car was used for an all-night "joy ride" last summer while I was stopping in your city. Hence the above scheme to prevent a repetition.

C. A. COCHRAN.

Youngstown, O.

ABRASIVES ARE VERY DIFFICULT TO REMOVE.

Editor THE AUTOMOBILE:

[1,416.]—Referring to letter No. 1,387 by E. Sparenberg, would like to say that I can see ruin ahead for V. R. Lane's motor if he adopts the practice of introducing emery in any form into his cylinders. I also much doubt the ability of any man to grind cylinders as proposed and get them round and true. I would advise Mr. Lane to send his cylinders to a cylinder-grinding machine regardless of the expense, as he would then have something he would enjoy. As it is almost an utter impossibility to completely clean out a cylinder of emery flour or dust, he will find that the grinding will continue long after he puts the motor to work.

Providence, R. I.

W. J. B. S.

THOMAS '09 "LITTLE SIX" HAS GOOD FEATURES

DEVELOPMENTS of an unusual nature have been confidently looked forward to in the policies of many of the large makers for 1909, but it was hardly thought that they would materialize so soon, or that they would be of such a revolu-

tionary nature as the announcement of the Chalmers New Detroit four-cylinder car to sell at \$1,500, and the Thomas "Little Six" for 1909, listing at \$2,500. These figures alone fail to convey the impression that is made when the technical details of the car are reviewed, for then it is realized for the first time that these offerings are not merely repetitions of attempts that have gone before to produce a cheap car, but are the successful culmination of long study in the problem of producing a high-grade car to sell at a low price.

not made in the conventional upper and lower halves—with end plates for taking the end bearings of the crankshaft and camshaft. It is carried on a three-point support, the forward end of the crankcase having a central foot which reposes on a drop cross member of the frame, whereas the rear of the engine is supported on a transverse tube which passes through split eye-holes on the rear of the crankcase and is supported on side frame members. This tube also serves as an attachment for the steering column housing. No fan is used behind the radiator, substitution for it taking the form of fan-blades riveted to a sheet metal band attached to the periphery of the flywheel.

The connecting rods are of especially light pattern, and have the big ends lined with Parson's white brass. The water circulation is by thermo-syphon, and, in order to provide for sufficient circulation, the pipes which conduct the water to and from the radiator are of exceptionally large section. This can be seen by inspection of the photographs of the engine, reproduced herewith, an interesting feature being the attachment of the lower water pipe to pockets which form extensions from the cylinder jacket walls. The radiator is similar to that used on the Thomas-Detroit, having horizontal cooling vanes closely spaced.

A very interesting feature of the cooling system is the means whereby its water capacity is increased to the limit demanded by the use of the thermo-syphon circulation system in vogue.

Thomas "Little Six" Motor Showing Unusual Location of Oiler.

This will be at once apparent from a description of the features of the motor. The cylinders are cast in triple block with detachable water-jacket heads and end plates. Both the inlet and exhaust ports give into common passages, so that only double branch pipes are necessary from the carbureter and exhaust outlet. All the valves are on one side of the engine, and the valve lifters are made with flat ends, which bear against the cams in place of having roller contacts, as is usual. Both camshaft and crankshaft are supported on annular ball-bearings of a positively separated type. The crankcase is a tubular construction and is

Radical Departure in Circulation Piping of Thermo-syphon Cooling System.

Double ignition is provided, the distributor being located on the carbureter side of the engine, while the high tension magneto, by Bosch, secured in place by an encircling metal strap, driven through the medium of an Oldham coupling, is upon the right-hand side of the motor. The lubricator, which is a

Plan View of Three-cylinder Casting.

force feed of McCord pattern, is located on a level with the magneto base, also on the right-hand side of the engine, and is driven positively through the means of a pair of spiral gears. Sight feeds are located on the dash so that the lubrication can be constantly watched by the driver. The lubricator can be removed easily by an ingenious way of slotting the lugs which support it. Three point support for the engine is utilized, the rear end of the motor being carried from a cross tube support by brackets bolted into the side rails of the frame while the front end of the motor rests upon the drop bar, forming the front cross member of the frame. An unusual refinement is the carrying of the starting crank and its disengaging mechanism integral with the crankcase. The high tension leads from the distributor and magneto, are neatly cased in housings supported by small brackets located on the water jacket covers. These housings are so arranged that only the smallest possible amount of wire is exposed between the housing and the plugs, this making both for neatness and electrical efficiency.

A steel band having helical blades riveted to it, encircles the flywheel, and this insures a very efficient fan action without decreasing the strength of the flywheel. The clutch is of the three disc pattern used on all previous Thomas models, though it has been somewhat lightened and refined to suit this new model.

Directly behind the clutch is a well designed universal joint, this joint being the only one used in the transmission system, while back of this joint is the clutch collar, mounted with a ball thrust bearing. The clutchbrake pedals and the selective portion of the gear-striking mechanism is all carried in brackets mounted on the central cross member of the frame, the propeller shaft housing also being suspended from this same cross member. The transmission is grouped about the

rear axle, is of the selective type, and gives three speeds forward and reverse. The transmission and rear axle form a neat unit. The shafts are carried on annular ball bearings, the gears being made from a special heat-treated nickel steel. A single universal joint is used, that forward of the clutch collar, but the construction is such that the propeller shaft is exceptionally long, providing for ample road clearance and a small transmission deflection. The housing of the propeller shaft is utilized to transmit both driving effort and torque.

The frame, which is of the single drop pattern, is suspended on long semi-elliptical springs at the front end and full elliptical with double scrolls at the rear. This gives an easy action with very little recoil. All the brake connections lie within the lines of the frame, so that the utmost cleanliness in contour is secured for the outline of the completed car, together with exceptional ease of keeping the machine clean in bad weather.

The control is entirely standard. The change speed and brake levers are in the usual position, but particular pains have been taken to locate them with regard to the steering wheel, the pedals and the driver's seat, so as to secure the maximum of comfort. An unusual feature of the car is the fact that it is mounted on 36-inch wheels, 3 1-2-inch tires being provided for both front and rear wheels. In the body work the straight-line effect is carried all through.

Especially happy has been the proportioning of the body dimensions and the location of the driver's seat in regard to the control levers, the steering wheel and the pedal position. Luxury is provided by the use of very deep cushions and ample room in the passenger accommodation. The first aim of the Thomas designers has very evidently been to secure a combination of grace with comfort, for particular attention has been paid to the spring suspension. The wheelbase is 122 inches, sufficiently long to permit both the adherence to accepted lines and the provisions of well-balanced body work, and the engine—30-horsepower—should be ample to handle the car, primarily designed for comfort and general use, with ease under all conditions.

Valve Side of a Cylinder Casting.

Rear View of Complete Chassis.

PANHARD EXPERIMENTS WITH NOVEL DEVICE.

Daily newspaper reports to the effect that the Panhard & Levassor Company has succeeded in perfecting a simple device to eliminate the change-speed gear box have been given considerable publicity within the past few days, but the statement of the case given by the New York representative of the company does not put as roseate a hue on the report as the dailies have given it. When appealed to for information Mr. Massenet said:

"As you are probably aware, the Panhard company is always on the lookout for improvement and is willing to try anything that appear to have sufficient merit, with a view to acquiring the patent should the claims prove sound. Whether this is some outside patent, or something developed in the shop, I do not know, but my latest advices inform me that some experimenting has been done with a device of this kind and the experiments are still going on. Whether the device will ultimately be applied to stock cars, I do not know, but if so it will probably only be to cars of very low power, if at all. Too much credence must not be placed in daily newspaper reports of such things, as they are written by non-technical men.

IF such a car as the Chalmers New Detroit, which is to be one of the E. R. Thomas Detroit Company's offerings for 1909, had been placed on the market three years ago, it would have been shunned by the novice and the experienced alike, and there would have been much head-shaking as to what it was built of to sell at the phenomenal price which its makers have put on this most attractive looking 24-horsepower, four-cylinder car, namely \$1,500. But under present conditions the latter is merely another striking indication of what a modern factory and purchasing organization can do with a good design to work on. It is likewise a sign of the fact that American makers are finally beginning to realize in no uncertain manner just where the popular demand is trending. There has been entirely too great a gap between the actually low-priced car with its numerous limitations of heavy weight and low power, and the medium-priced car with sufficient power and style about it to satisfy the man who realizes only too well what he wants in the shape of an automobile, but to whom the really good car has been an impossibility heretofore.

The Chalmers New Detroit strikes at a point between these two, where it is going to make its influence felt in no uncertain manner. As its makers state, it is a car in a class entirely apart from any of the low-priced machines hitherto placed on the American market, its designer, H. E. Coffin, having embodied in it features only to be found on machines, of either American or foreign origin, at many times its price. Some of these, briefly summed up, are the unit power-plant with its one-piece casting, multiple-disc clutch, selective type of sliding gear giving three forward speeds, full-floating type of rear axle, ball bearings throughout the car, and a number of others, which are mentioned further on.

Doubtless the feature that will earn the greatest commendation for the designer of the car is its extremely compact and well thought out unit power-plant. The four-cylinder, 24-horsepower motor, clutch and change speed gear-set are all inclosed in a single aluminum casing, which is constantly flooded with oil. The gear-

set case and clutch are attached directly to the flywheel casing and do not depend for their alignment on any part attached to the frame of the car, thus not only eliminating entirely the numerous troubles due to lack of alignment, but also providing the most effective protection possible for these essentials. The entire power-plant may be removed as it stands simply by taking out but six bolts.

The most striking feature to be found on a car that is being offered at such a price is the use of annular ball bearings of liberal size throughout. These are of the nonadjustable type, and are in every way duplicates of those being used on cars selling for many times as much. Even the crankshaft, which is unusually short and strong, owing to the one-piece cylinder casting, is carried on annular ball bearings—a construction only to be found in the highest-priced cars. The connecting-rod bearings are of die-cast tin babbitt, and have been designed with an exceptionally liberal amount of bearing surface.

There are numerous points of merit about the motor itself which will immediately attract the attention of the experienced eye. Lightness and compactness have been gained to an unusual extent by combining the four cylinders in a single casting, while

Compact Unit Power Plant and Gear-set of Chalmers New Detroit.

Carburetor Side Illustrating Neatness of One-piece Casting.

it also gives the further advantage of more satisfactory water-jacketing. The intake valves are placed in the head of the cylinder, and the exhaust valves are at the side, this arrangement making it possible to use very large valves, considering the bore of the cylinder. The intake valves are operated by overhead rocker arms, and measure 2 1-4 inches in diameter, while the exhaust measures 1 1-2 inches, and its operation is by means of the usual direct thrust method. Simplicity has been attained by employing the constant level splash oiling system originated by Mr. Coffin, fresh oil being continually supplied to the engine by a gear-driven pump, drawing oil from a reservoir at the bottom of the crankcase. Individual compartments are provided for each crank throw, and partitions have been placed in the crankcase, thus preserving the oil level throughout the crankcase regardless of the grade on which the car is traveling. With this system, a single filling of the reservoir is ample for a 500-mile run, while it requires very little attention and has an extremely high factor of reliability, owing to its simplicity and lack of small parts and tubes.

A vertical tube McCord radiator forms the chief essential of the cooling system, the water being circulated by means of a centrifugal pump located at the rear end of the camshaft and inside the flywheel casing. A feature that is indicative of the painstaking attention to detail which has been lavished on the car is to be seen in the radiator support. This takes the shape of a trunnion, thus relieving the radiator of all torsional strains set up by the twisting of the side members of the frame. An-

other feature that must be put down as an eye-opener, when the price of the car is considered, is the provision of a dual system of high-tension ignition, employing a Bosch magneto for the running side, and a coil and accumulator unit for emergency and starting. The same design of carbureter is employed as has become familiar on the Thomas Forty in the past, while an improvement has been introduced in the design of the gas-intake. Instead of the usual pipe leading from the carbureter, passages have been cast in the water-jacket cover of the cylinders, the charge thus flowing through a water-jacket passage on its course to the intake valves, thus avoiding condensation in cold weather.

The use of a selective type of sliding change speed-gear is another distinctive feature worthy of note. The gears slide upon a round shaft with four keys set at equal distances round it, engaging in corresponding keyways on the gears. All shafts and pinions are thoroughly heat-treated. The prop-

eller shaft is of heat-treated nickel steel, and runs through a long sleeve attached rigidly to the differential housing of the rear axle. This sleeve is fitted with annular ball bearings at its forward end, and takes both the driving and braking strain. It does away with the usual torsion rod and insures proper alignment of the rear axle at all times. A single universal is used just behind the gear-set. The rear axle driving unit is of the full-floating type, the entire weight of the car being carried upon the heavy axle tube. The live axles and gears are 3 1-2 per cent. nickel steel, heat-treated.

The suspension consists of semi-elliptic springs forward and three-quarter elliptics in the rear, the spring seats being swiveled spherically upon the axle tubing, thus preventing twisting of the spring under unusual shocks. Ball bearings are used throughout the differential and in the rear wheels. The front axle is a single piece drop-forging of new design I-beam section, the spring seats being forged integral with the axle. The center of the front axle is the lowest part of the car, and allows a full

9 1-2 inches clearance. The Thomas Forty will also be continued practically without change for 1909, with the exception of three-quarter elliptic rear springs, and will be known as the Chalmers Detroit Forty.

Side View Complete Chassis Which Gives an Idea of Small Space Occupied by Power Plant.

AUTOMOBILE FIRE FIGHTERS FOR EAST AND WEST

ALL that is modern and progressive is usually ascribed to the large cities, and the rural visitor is usually shown the sights and wonders with great pride by his city cousin, but since the advent of the automobile fire engine, many small towns are taking the lead of their larger brothers by going ahead in this direction and installing apparatus for fire protection that is far more modern than that to be found in many a large city. An instance

1,000 feet of standard water hose, water-play nozzles, hand extinguishers, lanterns, pikes, hooks, crowbars, axes, door openers, ladders and the like, thus giving it a most complete outfit.

New Rambler Fire Fighter for California.

One of the first fighting machines to travel under its own power that has been seen in the far West has just been built by the makers of the Rambler and was designed by F. S. Craig, chairman of the board of public works at Long Beach, Cal. Before deciding to adopt the automobile type of fire fighting engine, the authorities undertook numerous and exhaustive tests to determine the relative merits of horse-drawn and gasoline-driven machines, and a great many various kinds of apparatus of both types were put through their paces at great length before any decision was reached, so that Thomas B. Jeffery & Company may well consider the selection of the product of their

Knox Air-cooled 40-Horsepower Fire Fighter for Chicopee, Mass.

of this is to be found in the case of Chicopee, Mass., which has just received a new Knox fire fighting truck. This car is the product of the Knox Automobile Company, Springfield, Mass., and is said to be the first of its kind to be turned out in this country. It is equipped with a 40-horsepower air-cooled Knox motor of standard construction and has been designed especially for the use of country towns. It is for the Williamsett fire department, which is what is known as a "call department," having to cover the neighboring hamlets of Aldenville and Fairview.

Its construction where the chassis is concerned follows the lines of the Knox products more or less closely throughout, a sliding change-speed gear of the selective type providing three forward speeds and reverse constituting this step between the motor and the rear wheels, the final drive being by a countershaft and double side chains, the rear axle being a one-piece two-inch section of steel. The transmission and wheels are equipped throughout with Timken roller-bearings of liberal size for the load to be carried. Unusually powerful brakes are provided, the running brake, which is pedal operated, acting on the ends of the countershaft, while the emergency operated in the usual manner by side lever acts on drums attached to the rear wheels. The tire equipment consists of solids, measuring 34 by 4 inches, front and rear. In addition to the usual outfit of oil side and tail lamps, a 10-inch Rushmore searchlight supplied by a Prest-O-Lite tank is provided and wired so that it may be electrically lighted by a push button at the driver's seat. The car is geared to have a maximum speed of 20 miles an hour and will ascend grades of varying heights at from 5 to 15 miles an hour. The fire fighting equipment consists of two chemical engines of the Halloy-way type, 300 feet of chemical hose,

Kenosha plant a well won victory over a number of competitors.

The motor is of the four-cylinder vertical type, the wheel base is 120 inches, the regular 1908 Rambler tire equipment is used, while the car is guaranteed to operate under a weight of 3,000 pounds at a speed of at least 35 miles an hour. The rear portion of the car is used to carry 250 feet of hose, the chemical tanks being double 80-gallon receptacles under the seats.

A special starting device has been provided in the form of an inclined platform so that when the alarm is received the platform is tipped and the car glides out of the station without one second's delay. By keeping the gear-changing lever in the high-gear position the motor is thus started automatically without the necessity of delaying to crank it, and much valuable time is saved in getting under way, actual tests extending over a period of time demonstrating the fact that the power-driven apparatus could reach the fire in a fraction of the usual time.

Rambler That Will Take Care of Fires in the Town of Long Beach, Cal.

A FEW OF THE NEW EUROPEAN NOVELTIES

THE usual method of repair when a tire casing bursts and a new one is not available is to temporarily lace a gaiter round the defective spot and put in a new air chamber. The method is recognized as being defective, for the air chamber under pressure enters into the opening made and by reason of its

Frenchman Invents a "Corset" for Tire Repairing.

deformation and friction has a tendency to burst. A temporary repair produced by M. Eyquem consists in placing a rubber sleeve around the air chamber instead of the casing, and attaching by means of pressure buttons. One portion of the sleeve or corset, as the inventor has termed it, is faced with leather and it is this strengthened part which must be placed opposite the hole. If the blowout is of a serious nature, the hole in the casing might be stuffed and the ordinary sleeve placed over the tire in addition. This is not usually necessary, however, for ordinary road conditions.

To Facilitate Changing Heavy Clincher Tires.

Until dismountable and quick-change rims have come into general use there will always be room for improved tools for the fitting of the larger sizes of pneumatic tires. One of the most popular of these on the European market is known as the Archimede and consists, as shown in the illustration produced from *Omnia*, of a couple of pivoted arms *A* and *B*, the former carrying at its base a mechanism operated by a handle. The pulley at the base of the arm *B* is free to turn in any direction;

the two pulleys *F F* are geared and obtain their movement from the rotation of the arm *E*. By means of the screw *D* at the head of the apparatus the three pulleys are made to bear on the face of the rim. As will be readily seen, the operation of the arm *E* would result in the entire apparatus revolving around the rim. But the operator holds the machine by placing his hand on the upper portion and it is the rim which is caused to revolve as the handle is turned. By reason of the forward finger *M*, which raises the tire, and the spool *L* which pushes it completely into position, the most difficult tire is mounted with a minimum of labor. The machine is of special value in garages and for use on dismountable rims which, by reason of their being detached, are often difficult to handle. Anyone who has labored and perspired over the task of forcing an obstinate five-inch clincher onto its rim on a warm summer's day when the mercury had climbed way up and the humidity was in proportion would appreciate what a convenience such a device would be under the circumstances.

Convenient Aid for the Process of Valve Grinding.

The operation of the new valve grinding tool will be readily understood by reference to the accompanying illustration. A steel cut gear wheel at the top of the sleeve accommodating the shank and in mesh with a toothed quadrant allows of a movement of about two-thirds of a circle. To prevent scoring a

Strangely Familiar "Foreign" Valve Grinding Tool.

helical spring is supplied with each instrument to be fixed at the foot of the valve stem, so that as soon as pressure is removed from the head the valve lifts and the position of the particles of emery is changed.

A Tire Maker's Advice About Loading.

It is not sufficiently realized by automobile purchasers that the manner of suspension of a car and especially the position of the rear axle have an enormous influence on the life of tires, declares the head of one of the largest tire factories in the world. A well suspended rear axle is an important factor in tire economy. Cars with short, harsh rear springs or overhanging bodies are ruinous to tires, the amount of work which the bandages are called upon to perform, especially if a closed body is carried, being enormous. It would be possible to mention many cars which, while not special offenders in the matter of weight, are tire devourers merely by reason of the position and suspension of the rear axle. Total weight is not all that should be considered in buying a car, automobiles that are equal in this respect showing enormous differences in their tire bills. While it is not possible to carry the full load between the axles, overhanging weight should be avoided as much as possible if tire economy is any consideration. This applies particularly to the closed car, and as this type represents a very substantial proportion of the total number of cars in use nowadays, it is easy to appreciate that disregard of it means a very large increase in the aggregate tire bill, though it is often so great even in the case of the individual that it is not necessary to refer to it *en masse* to make it appear imposing. Keep the weight as much between the axles as possible, and likewise keep it as low as possible.

Tool for Replacing Large Tires on Clincher Rims.

ITALY'S AUTO FACTORIES USE AMERICAN MACHINERY

AN interesting report has been filed with the State Department by Special Agent Capt. G. L. Carden, in which he describes two Italian establishments manufacturing automobiles and in each of which American tools are used.

The shop equipment of the Zust works at Milan is of a high order. About 70 per cent. of the tools installed are of American make. From Robert Zust Captain Carden learned that the necessary parts in stock at that time admitted of the assembling of about 200 machines. This firm makes only 50-horsepower engines, and every engine is carefully tested in the laboratory shop before being issued. The work required on these engines is of a very careful and painstaking sort, and it is evident at the Zust shops that a great amount of attention is paid to detail.

Decreasing Number of Italian Motor Works.

The Zust shops in Milan are devoted only to automobile construction, and are independent of the machine-tool house of the same name at Lake Maggiore. The ownership, however, is the same. The Zust shops seem to have weathered the recent depression in the automobile business and may be expected to continue work. Of the 50 automobile concerns which sprang into existence in Italy during the past three years not more than ten or twelve will probably survive, and in some quarters it is doubted if at the end of the year there will be more than six or seven Italian automobile firms in the field.

Many tools at the Zust shops were found idle and covered up, while there appeared to be many new shipments on the floors still unopened. A little over a year ago at this time automobile makers were willing to pay high rates of advance for immediate delivery of tools. Among the American machine tools found in the Zust shops were observed standard-type machines from Brown & Sharpe, Hendey-Norton, Becker-Brainard, Cincinnati Milling Machine Tool Company, and Jones & Lamson.

Isotta-Fraschini Works Have Largely American Tools.

The Isotta-Fraschini automobile works in Milan are working at present about 700 men. The installation of machine tools is one of the best I have seen in Europe. It may be estimated roughly that there are 400 machine tools in service on the floors, and that at least 70 per cent. are American. It was indicated that the great majority of these tools were purchased during the past two years. The plant is at present working about 50 per cent. as many men as during the recent busiest time. The following makes of American machine tools are installed here: Brown & Sharpe, millers and grinders; Potter & Johnson, automatic turret lathes; machines from the Gridley Automatic and Windsor Machine Tool Company; Lodge & Shipley, and Lucas Machine Tool Company, engine lathes; Cincinnati Milling Machine Tool Company and Becker-Brainard Company, millers; Warner & Swasey, hexagonal turret lathes; Baush Machine Tool Company, boring mills; Cincinnati Shaper Company, shapers; Gleason Company, gear cutters; Pratt & Whitney, lathes; Cincinnati Machine Tool Company, drill presses; Bickford Drill and Tool Company, drills; Landis Machine Tool Company and Norton Grinding Company, grinders; Baker Brothers and Hendey-Norton Company, shapers; Acme Machine Tool Company, automatic screw machines.

Labor—Modern Equipment—Lack of Information.

The Isotta-Fraschini works are paying machinists between 45 and 50 centimes (100 centimes = 1 franc = 19.3 cents) per hour on a ten hours per day basis. An operator working at a Herbert lathe when questioned in my presence as to his pay exhibited a ring job on which he was engaged, and said he is able to finish about 15 of these rings per day. For each ring he received 45 centimes, which would mean 6.75 francs for a day's work. This rate of pay from an American viewpoint is extremely low. The work was well finished, but the speed was

very much below what is seen in American shops. One of the officials of the establishment informed me that his chauffeur, who worked hard at the shops during the day, was able to satisfy himself on a dinner in the near-by restaurant costing 60 centimes. This included no meat except, perhaps, a small quantity of sausage. Many of the Isotta-Fraschini workmen, it was said, did not know the taste of a beefsteak, and yet there is a fine organization at this establishment. The work is carefully done, the attention to detail is painstaking and with the magnificent equipment possessed this plant only needs speed to earn a high percentage of efficiency. About 75 per cent. of the Isotta-Fraschini outputs are for export, and it was stated that the falling off of orders from the United States during the past year had been felt by this firm.

The present Isotta-Fraschini shops are modern throughout. They were put up in 1905, and practically all the tools now in service were purchased subsequent to the opening of the new shops. All tools installed in this plant are arranged in parks and fenced off, the millers in one group, the lathes in another, the boring machines by themselves, the automatics together, and so on. The statement was made by an official that when a new tool is received from America about all the information they had was what could be gleaned from a printed description in English, and that the shop expressions puzzled them in translating.

The Isotta-Fraschini works are one of the few firms which have weathered the recent automobile depression in Italy. This establishment is at present well stocked up with machine tools, but should conditions improve, as every indication points, it will not be long before this firm will require additional machines, and especially so if any enlargements are made of the present shops. This establishment is turning out engines ranging up to 65 horsepower, and for racing machines to still higher powers.

Present Conditions Satisfactory—Future Encouraging.

The industrial conditions in northern Italy at this writing (April 27) are good. Last year was the best year in the present decade, and the first quarter of the present is as good as the average showing for the year succeeding. This latter statement is based on the quarterly balance sheets required of all firms on the last day of March. My attention was called to the foregoing by Doctor Pirelli, of Pirelli & Co., Milan, which firm is working, 5,300 men. Their outputs are confined to electric submarine cables, land cables, and much of the rubber equipment utilized in automobile construction. The last-mentioned branch of the business has brought this firm in close touch with the automobile industry in Italy, and has placed the representatives of the firm in an excellent position to sum up the present situation. It is Doctor Pirelli's opinion that the automobile business in Italy will be in better condition by reason of the recent depression than otherwise. At first buyers of automobile stock could only see enormous dividends, but no account was taken of the cost of advertising, the cost of races, and other expedients resorted to to push sales, all of which expenses increased enormously as new firms came into the market.

At least 52 Italian automobile manufacturing firms were organized during the past two years, and of this number about 28 were established in Turin. The small firms have now been crowded back, and in many cases the small shops will take up new lines of industry. This they will be enabled to do by reason of the excellent equipment they possess. Large firms like Isotta-Fraschini and Fabbrica-Italiana-Automobil-Torino will continue to hold the field. These firms are at present working at a rate equal to about 50 per cent. and 65 per cent., respectively, of the rate demanded by last year's orders, and though the business is relatively quiet at their shops these larger firms are managing to hold their organizations together, and will be in position to take advantage of returning busy times.

CONDITIONS FOR HOWER TROPHY.

Judging from the number who have stated their intention of entering runabouts to compete for the Hower trophy, the contest for which is held in connection with the annual reliability tour of the American Automobile Association, it looks as if there would be twice as many entrants this year as last. The Hower Trophy will be competed for under the same rules as the Glidden Trophy, a point system of scoring being employed, thus necessitating the presence of an observer on each competing car. The runabouts as a whole will be divided into two classes, to be known as Class A and Class B, the former comprising cars listing at less than \$1,500, and the latter cars listing at more than \$1,500. When the day's schedule is less than 7 1-2 hours, Class B will be allowed 10 minutes more in which to finish than Class A, and when the day's schedule is more than 7 1-2 hours, Class B runabouts will be allowed 15 minutes more. In the event of there being a tie between two or more of the competitors at the end of the tour there will be no lengthy run required to settle

Hower Trophy for Runabouts, A. A. A. 1908 Tour.

it, as the conditions provided for running off any tie that may occur are such that one extra day will doubtless be found sufficient to decide which is the winner.

The trophy itself marks a departure this year, as, instead of the bronze figure awarded last year, a handsome silver shield has been substituted. This shield is made with a convex surface, making it stand out against its rosewood mount in relief. The shield itself is a heavy piece of pure silver, handsomely chased and engraved, the ornamentation in the lower part consisting of the representation of a runabout containing its driver and a passenger. Immediately above is the space intended for the name of the winner, while surmounting this is the inscription which follows. This reads: "Hower Trophy for Runabouts, Fifth Annual Reliability Touring Contest of the American Automobile Association; Buffalo-Boston-Saratoga. Presented by Frank B. Hower." The trophy itself will be placed on exhibition in New York this week. Cups and similar articles have become more or less commonplace as automobile trophies, owing to the great number that have been offered during the past few years, so that any departure from the ordinary is very welcome.

THE AUTOMOBILE CALENDAR. AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
February, 1909.—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Races, Hill-climbs, Etc.

- June 13.....—Hartford, Conn., Orphans' Day, Automobile Club of Hartford.
June 13.....—Cleveland, Annual Hill Climb, Cleveland Automobile Club.
June 17.....—Boston, Readville Track, Postponed Race Meet, Bay State Automobile Association.
June 17.....—Buffalo, N. Y., Orphans' Day, Automobile Club of Buffalo.
June 20-26.....—Albany, N. Y., Annual Five-day Tour of the Albany Automobile Club.
June 24-27.....—New York and Philadelphia, Double-Head Endurance Run to Delaware Water Gap, under the auspices of the "Public Ledger" of Philadelphia.
June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
June 27.....—Norristown, Pa., Skippack Hill Climb, Norristown Automobile Club.
July 4.....—Lowell Mass., 250-mile Road Race, Lowell Automobile Club.
July 4.....—Wildwood-by-the-Sea, N. J., Annual Speed Tournament, Motor Club of Wildwood.
July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
August 14.....—Chicago, Third Annual Algonquin Hill Climb, Chicago Motor Club.
Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.
Oct. 24.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.

FOREIGN.

Shows.

- Oct. 11-18.....—Paris, International Congress and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.
December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill-climbs, Etc.

- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
June 14.....—Mount Cenis Hill Climb, for Voiturettes.
June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial A. C.
June 15-19.....—Scotland, Annual Scottish Reliability Trials.
July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France.)
July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
Aug. 12.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclussen Automobile Club.
Sept. 1-3.....—French Voiturette Contest, Auspices "L'Auto."
Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.
Oct. 11.....—Berlin, Germany, Gordon-Bennett Balloon Race, Aeronautical Club of Berlin.

HIGHER-PRICED CARS ARE SELLING IN THE SOUTH

By F. S. SLY, TRAVELING CORRESPONDENT FOR THE AUTOMOBILE.

MEMPHIS, TENN., June 2.—There is a general feeling of prosperity prevalent in this city, as dealers report that they are not only selling more cars this year than they did at the corresponding period of 1907, but the cars are higher-priced. Not a little of this increased business is credited to the very successful automobile show that was held here last April, under the auspices of the Automobile Dealers' Association of Memphis, of which Jerome Parker is president, and W. S. Bruce sec-

Valley of Tennessee River from Lookout Mountain.

retary. This stimulated interest in automobiling to a very great extent, and there is no doubt that it will be repeated next year, developing into an annual fixture with the trade here.

But despite the fact that Memphis can boast of no less than 500 cars in use, and interest in automobiling runs high, there is no such thing as a club. The roads are good in every direction out the county line, the best run being that to Brownsville, situated 120 miles from here, the road being good all the way. There are quite a number of cars represented, and garage facilities are good. The Memphis Automobile Company represents the Thomas, White, Franklin and Buick, beside the Baker electric, while the Jerome P. Parker Company has the Ford and Stoddard-Dayton, and McDonald Automobile Company the Mitchell, Rambler and Holsman; the Cullen-Butler Company have the Premier, Reo and Auburn; W. S. Bruce & Company have the Welch, Maxwell and Columbia; the Lilly Carriage Company represent the Peerless and Oldsmobile, and H. A. White has the Pope-Toledo and Cadillac. Of these dealers the first six maintain modern and well-equipped garages, such as are to be found in the largest cities.

Nashville Not So Favorably Inclined.

NASHVILLE, TENN., June 4.—Nothing affords a more striking illustration of the value and influence of the presence of good roads as the condition of the automobile business here. While Memphis is congratulating itself on increased business and higher-priced cars this year, Nashville dealers complain that business is not as good as it was a year ago at this time. In spite of this, however, and the fact that the roads roundabout are in very poor shape, the city can boast of about 480 cars, as shown by the members of the license tags. The city streets are well paved, but outside good roads are few and far between, there being but two or three altogether, which goes to show that prosperity travels over well-paved highways. There was an automobile club here at one time, but interest in its welfare lagged to such an extent that it has finally gone out of existence. The pikes in this section need repairing so badly that autoists have got together and raised a subscription for the purpose.

Among the cars represented here are the Reo, handled by the Rock City Auto Company; the Rambler and Ford, represented by J. S. Roller; the Oldsmobile, White and Buick, for which the Southern Automobile Company is the agent; the Dorris and Stanley, handled by the Nashville Motor Car Company; the Stevens-Duryea, for which B. F. Bill is the agent; the Lambert, handled by J. W. Chester; the Mitchell, which is represented by the Keith-Simmons Hardware Company, and the Moon, for which Joseph Yarrow is the agent. With the exception of the last two, all these concerns maintain garages, and some of them are very well fitted up.

Chattanooga Is a Paradise for the Autoist.

CHATTANOOGA, TENN., June 6.—With its rugged scenery, that is dotted with many of the historic battlegrounds of the Civil War, this part of Tennessee, and Chattanooga in particular, offers a great many attractions to the automobilist, whether resident or on tour. The country is one of the most mountainous parts of the State, but the roads are among the very best that the entire South has to offer, owing to the fact that they have been built and are maintained at the expense of the Federal Government. One of the most beautiful leads up to Missionary Ridge and goes along the entire length of it. No better example of what the government can do in the way of road maintenance could be desired than this. Another good road that is quite accessible to autoists leads to the top of Lookout Mountain, 1,750 feet above the city. The county likewise keeps its roads in the best of shape, and is now boring two tunnels through the ridges on opposite sides of the city, in order to save the climb over them. This will be one of the first instances in this country where engineering practice has really been applied to road building. Tunnels are quite common on European roads, but they are an extreme rarity here. These tunnels will be connected by a broad chert boulevard five miles long, and part of which is already under construction. This material abounds hereabout, and is largely used in road making.

There are no less than five good garages here, maintained by the following: The Chattanooga Automobile Company, handling the Franklin, Cadillac and Packard; the Joyce Automobile Com-

Chattanooga, That Reposes at the Base of Old Lookout.

pany, representing the Thomas and Buick; the H. H. Burke Automobile Company, the Ford and Reo; the Crescent Automobile Company, the White, Lambert and Model; and the H. D. Stebbs Auto Supply Company, the Rambler. Beside the foregoing there is the Wallace Buggy Company, representing the Stoddard-Dayton, Mitchell and Cartercar. There are from 150 to 200 cars in use in the city, but as yet there is no club.

ONE MAN'S VIEWS ON THE RACING "WAR."

Concisely put, going directly to the meat of the argument, and presenting the views of a man interested in autoing since its American inception, no better editorial view of the so-called "war" for the control of racing could be written than the following communication from one who confesses that it is written just to ease his mind: Editor THE AUTOMOBILE:

The issue is now clearly defined, and, as I see it, it is the American manufacturer and the A. A. A. against the foreign maker and the A. C. A. The feeling among the foreign manufacturers toward their American competitors has progressed from contempt to respect, and from respect to fear. The foreigners realize that their "goose" which has been laying the "golden eggs" is in *extremis* and nearly cooked. The fact that all those having agencies in this country are advertising "bargain prices," and the falling off in value of importations this year of almost 50 per cent. as shown by the Custom House returns, tells the story in plain language, and indicates that the American public has finally awakened to the fact that the American manufacturers are now making as good, yes, better cars for American conditions than the foreigner.

The knell of the "importer" is sounded, and the spectacle of a metropolitan club, which is frankly striving for recognition as a national body, permitting itself to be used by the foreigners to bolster up their losing game, is pitiable and offensive to every true American who is patriotically wishing and working for the success of the American manufacturers. The American manufacturers are big enough and strong enough to decline to

submit further to the dictation of the foreign clubs, which are merely the manikins of a select few of the foreign manufacturers who have not hesitated to so frame their rules as to secure for themselves every advantage. The Automobile Club of France killed the Gordon-Bennett, for the sole reason that it held the French manufacturers down to an equal chance for success with the rest of the world, and instituted a race that would permit their entries to greatly outnumber the other.

The cause for the manifest unfairness of some writers for the daily press can be clearly traced, and most of them are doing their papers an injustice which will surely react on their business management when the American manufacturers, who are their best advertisers, begin to ask some pointed questions. It may be that the business managers will wake up and forestall the necessity of replying to such embarrassing inquiries.

The Vanderbilt Cup race will surely be held, and the foreign manufacturers, who still hope to market a part of their production in this country, cannot afford to withhold their entries, although they may adopt the plan of entries by individuals to "beat the devil around the stump," and I confidently predict that the Vanderbilt Cup race will have more entries of foreign cars than the A. C. A. "Grand Prize," if it is ever held.

Vive la Vanderbilt Cup!

Borough of Brooklyn, New York City. FRANK G. WEBB.

Mr. Webb is a representative type of the American sportsman who lends his aid to a pastime purely from the love of it. For years he has served the Long Island Automobile Club in various capacities, was instrumental in its organization, and was a factor in the formation of a national body. Early in the progress of autoing, he objected to a single club "lording" it over the other clubs. His views will find favor among those who think one's own country should come first.

STRIVING FOR AUTO SIMPLICITY.

Generally speaking, it would seem that the time when a manufacturer deemed it incumbent upon himself to add a number of superfluous devices to his product to make the purchaser thereof think "he was getting his money's worth," to put it in the vernacular, had long since passed. Certain it is that the experienced buyer is not keen on parting with his money to acquire the maximum amount of steel and iron that a designer can work up into the shape of an automobile. Lightness consistent with adequate strength represents the guiding star of the up-to-date designer, but this end is not to be achieved by the addition of a number of useless, or what is the same thing, practically useless, devices, simply to enable the salesman to call the customer's attention to the fact that "It's all included in the price."

To mentally review the most successful American cars of to-day, and by these are meant those that have been successful from the very start, is to call to mind a succession of constructions distinguished more by their consistent simplicity of design than any other single feature. Even when reduced to its very simplest terms, the automobile is a piece of mechanism that consists of a comparatively large number of parts. That is, when only those that are actually necessary to enable it to perform its mission, are enumerated. Why, then, add things that only merit the contemptuous title of "doo-flickers," "godinkuses," and the like, from the experienced repairman? The day of "talking points" is over; the day of real merit has arrived, and merit needs no frills.

BUFFALO'S A. A. A. CONVENTION ASSURED SUCCESS

THINGS are to be done on a scale of elaboration never before known in connection with such events at the National Good Roads and Legislative Convention of the American Automobile Association, to be held at Buffalo, July 6-8. The practical demonstrations will be in the nature of a complete education. A total of 79 miles of road, costing upwards of \$700,000, will be in actual course of construction, affording highway officers, contractors and others an unusual object lesson. The road-making will comprise highways of brick, macadam and gravel, and subsequently these various surfaces will be tested with different dust preventives. That this practical work will be as thorough as the entertaining, which is in charge of the Buffalo Automobile Club, is assured by the fact that it is in charge of a committee of very practical men, namely:

George C. Diehl, county engineer, Buffalo, chairman; Frederic Skene, State engineer of New York; John P. Kelly, division engineer, State of New York; F. H. Williams, resident engineer, State of New York; Joseph W. Hunter, vice-president, American Roadmakers' Association, and highway commissioner of Pennsylvania; W. E. McClintock, chairman of Highway Commission, Massachusetts; H. S. Sisson, chairman, Erie County Board of Supervisors, Good Roads Committee; John Satterfield, Automobile Club of Buffalo; Seymour P. White, Automobile Club of Buffalo; J. S. McFarland, Automobile Club of Buffalo; James D. Warren, Automobile Club of Buffalo; Henry P. Burgard, Automobile Club of Buffalo; and C. M. Croiner, Automobile Club of Buffalo.

This convention has grown to proportions beyond all the original ideas of its promoters, and has become an event of unusual importance. Not only are the automobile clubs and good roads associations sending delegates, but the governors of the several

States are appointing official representatives. Delegates already have been appointed by the automobile clubs of the A. A. A. in different cities from coast to coast. These clubs and their delegates are as follows:

Los Angeles, Cal., Automobile Club of Southern California, Charles B. Hopper, secretary and treasurer.

Newark, N. J., New Jersey Automobile and Motor Club, Paul E. Heller, J. H. Wood and F. A. Cresselmire.

Springfield, Mass., Automobile Club of Springfield, Mark Aitken, A. E. Lerche, M. T. White and S. L. Haynes.

Elyria, Ohio, Automobile Club, A. L. Stark, W. N. Gates and A. L. Garford.

St. Louis, Mo., Automobile Club, Roy F. Britton, Sam D. Capen.

Wilkes-Barre, Pa., Automobile Club, W. R. Stephens, A. J. Puffinburg and W. C. Cook. Alternates are S. L. Smith, Roy Wyse and J. M. Anderson.

Philadelphia, Pa., Automobile Club, Powell Evans, W. O. Griffith and S. Boyer Davis.

Philadelphia, Pa., Quaker City Motor Club, A. T. James, Edwin A. Lewis, Dr. W. J. Donnelly and L. E. French.

Chicago, Ill., Automobile Club, T. J. Hyman, Claude Seymour and A. R. Stumen.

Bridgeport, Conn., Automobile Club, S. T. Davis and A. L. Riker.

Wilkes-Barre, Pa., Automobile Club, Dr. E. C. Wagner and W. L. Raeder.

Malden, Mass., Automobile Club, A. E. Bliss, A. B. Tenny and C. P. Price.

Washington, D. C., Automobile Club, Robert B. Caverly, John K. Heyl and William D. West.

LEADING TRADESMEN STRONGLY SUPPORT A. A. A. TOUR

HOW, more than any other contest of track or road, the A. A. A. tour for the Glidden trophy has come to be a criterion for the buyers of touring cars, is evidenced by the tangible results in sales noticed by manufacturers. H. O. Smith, of the American Motor Car Manufacturers' Association, says: "It is natural that men who want touring cars should be guided by the performance of cars in this event. To what other can they look? They are not buying cup racers for family use, and the track races offer them nothing in the line of information concerning a car's road efficiency. The demonstrations of a few miles they get are of comparatively little value, as every one knows. What they want to know is how a car runs day after day, on different sorts of roads, and how it travels in comparison with other cars. This they learn from the Glidden tour, as they do from nothing else, and with the new rules, which the manufacturers have approved, and the system of having observers on the cars, the tour will be of more importance than ever. That the buyers

of cars do watch this event and are guided by it can be proved in the most positive way. I know of many sales that can be traced as directly due to the showing made in the Glidden tour last year."

Another point of view, taken by a manufacturer who has an official position which makes it impolite for him to be quoted, is expressed as follows: "I think the agents have a right to expect the manufacturers to compete in the Glidden tour, no matter what the conditions of the trade. This event is known about and watched by automobilists all over the country, and it is mighty embarrassing for an agent to be asked why his car was not in the Glidden tour. Those who do not enter are apt to suffer from false inferences by buyers, who think that such non-contestants have lost confidence in their product. Our cars are all sold, but the agent is entitled to consideration just the same, and we want him to sell next year's cars as readily as he did this year's."

WILDWOOD, N. J., TO CELEBRATE THE FOURTH.

PHILADELPHIA, June 8.—Preparations for the annual carnival of the Motor Club of Wildwood, which is scheduled for July 3-4, are proceeding apace. The affair will open with a regularity run on Friday, July 3, from this city to the sea, over a roundabout course yet to be announced. Fully two score local automobilists have announced their intention of entering this portion of the program, while as many more will take part in the run unofficially. Eight events will make up the program of short-distance brushes over the mile course on Central avenue boulevard, which will feature the second day.

MR. BATCHELDER WILL WITNESS GRAND PRIX.

A. G. Batchelder, managing editor of THE AUTOMOBILE, accompanied by Mrs. Batchelder, sailed on Saturday, June 5, on the steamship *Oceanic* for a five weeks' trip abroad. A short time will be spent in England, after which they will visit Paris and later attend the Grand Prix on the Dieppe circuit, July 7.

Paris, June 9.—Marquis De Dion, president of the A. C. of France, and 300 others, are suffering from ptomaine poisoning, following the banquet held at the clubhouse this evening, and one man has already succumbed, while many others are very ill.

MADISON SQUARE GARDEN SHOW TO BE JANUARY 16-23

AT the meeting of the board of managers of the Licensed Association, June 4, it was decided to hold the ninth national automobile show at Madison Square Garden, January 16-23. The meeting was well attended. Col. George Pope made a revised report of the eighth national show, held last November, and also called the attention of the members to the progress being made for the ninth national exhibition. Architects and decorators are now at work preparing material to be submitted to the show committee for the decorative scheme and general floor plan of the Garden, and it is expected that at the next board meeting a decision as to just how the Old Garden will look for the ninth national show will be reached.

As a result of the very satisfactory results attained under the show committee of last year the board were unanimous in re-electing Col. George Pope as chairman of the new committee, with Charles Clifton and Marcus I. Brock as his associates, and M. L. Downs, secretary. Mr. Brock was a member of the show committee up to the time he resigned to go with the Autocar

Company. He now represents the Autocar Company in association matters, and his efficient work on the show committee entitled him to reelection as a member of that committee.

Those present were: J. S. Clarke, Marcus I. Brock, Autocar Co.; W. C. Leland, Cadillac Motor Car Co.; M. S. Hart, Corbin Motor Vehicle Corp.; J. H. Becker, Elmore Mfg. Co.; H. H. Franklin, G. H. Stillwell, A. T. Brown, A. E. Parsons, H. H. Franklin Mfg. Co.; E. Hewitt, Hewitt Motor Co.; A. N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Company of America; H. Lozier, Lozier Motor Co.; Wm. E. Metzger, Northern Motor Car Co.; F. L. Smith, Olds Motor Works; H. B. Joy, Packard Motor Car Co.; C. Clifton, George N. Pierce Co.; A. L. Pope, Pope Motor Car Co.; George Pope, Pope Mfg. Co.; E. D. Shurmer, Royal Motor Car Co.; G. E. Mitchell, Alden Sampson, 2d, R. H. Salmons, Selden Motor Vehicle Co.; E. McEwen, F. B. Stearns Co.; C. C. Hildebrand, Stevens-Duryea Co.; E. S. Church, Waltham Mfg. Co.; Thos. Henderson, Winton Motor Carriage Co.

INDEPENDENTS' SHOW WILL HAVE SPECIAL TAXICAB EXHIBIT

RECOGNIZING the important position that town cars are taking in the commercial and pleasure life of this country, the show committee of the American Motor Car Manufacturers' Association, at its meeting last week, decided to have a special taxicab division in connection with the annual automobile show, to be held at Grand Central Palace, New York, December 31 to January 7. Aside from the exhibits of the regular manufacturers, there will be a certain amount of space set aside where each maker will have the privilege of exhibiting one model of a taxicab or town car if that is a part of his regular production.

With the eighteen exhibitors of foreign cars comprising the Importers' Automobile Salon, and the score or more of American makers that are supplying the demand for this type of automobile, it is expected that the division will be complete enough to satisfy the most exacting. Exhibitions in this section will be limited to a single model of taxicabs.

It will be the first attempt to segregate these cars, that are now such an important part of the motor car pastime and industry. There will, of course, be the usual section for commercial vehicles, with pleasure vehicles on the main floor.

Proposals for an entirely new plan of decorating the Palace were received and considered at the meeting, but no announcement of this feature will be made for some time.

Plans for the association's Western show were submitted, and a representative of the association is visiting Chicago this week to confer with the Chicago Automobile Club and the Chicago Motor Club.

In attendance at the meeting were H. O. Smith, chairman; Benjamin Briscoe and Alfred Reeves, of the A. M. C. M. A.; E. R. Hollander, representing the Importers' Automobile Salon, Inc., and Peter S. Steenstrup, of the Motor and Accessory Manufacturers.

DELAGRANGE'S RECORD FLIGHT AT ROME.

PARIS, June 3.—Excluding the Wright brothers, in whom Europe has once more lost all faith, the world's new flying record belongs to Leon Delagrangé, Parisian sculptor and amateur aeronaut, who has remained above the Place d'Armes at Rome for a period of 9 minutes 30 seconds. It is the longest time any machine of the heavier-than-air type has remained aloft under official observation. The distance covered was not officially measured, but from the rate at which the apparatus was traveling is calculated at rather more than five miles. The experiment took place early on the morning of May 27 and was watched by the King and Queen of Italy and members of the Italian court, the King personally congratulating the French aeronaut on the successful results obtained. A second flight over the same ground gave as a result five minutes in the air, distance covered being approximately three miles. Delagrangé used his Voisin Frères aeroplane and Antionette eight-cylinder water-cooled engine.

The Italian populace apparently have been overexpectant in the matter of aerial flights, for when in the face of a strong wind Delagrangé soared aloft for a few hundred yards they were so disgusted that they expressed their feelings by uncomplimentary hissing. An Italian engineer who had been largely responsible for bringing Delagrangé to Rome for the public demonstration was set upon and very unceremoniously handled.

REMISS AUTOISTS MUST PAY THEIR LICENSES.

INDIANAPOLIS, IND., June 8.—City Controller George T. Breunig opened his warfare against automobile owners who have not paid their city license fee this year by quietly filing about 100 warrants for their arrest last week. Up until noon Saturday a large proportion of this number had been arrested, thirty-eight being arrested Friday alone. Barely 200 of the 1,000 automobile owners of the city have paid the license fee this year. A large number of motorcycle owners are also delinquent, although the city officials are somewhat in doubt as to whether they should be taxed \$3 as an automobile, or \$1 as a bicycle.

METUCHEN ESTABLISHES A NEW SPEED TRAP.

METUCHEN, N. J., June 9.—Another pitfall for the unwary driver who has a desire to "let her out a bit" has just been established on the road from this place to New Brunswick. It is placed just at the beginning of a fine straightaway stretch, and that its location is an excellent one for the purpose is shown by its large takings, \$400 in fines having been collected in one day. Autoists going that way should refrain from opening the throttle on anything that looks extra tempting for a spurt. There is also a trap being worked at Princeton, N. J., on the very edge of the town at the Kingston side. All automobilists are requested to keep these new speed traps in mind.

Thomas Detroit with Light as Pilot Winning its Class Trial.

WORCESTER, MASS., June 8.—In the third annual automobile hill climbing contest, conducted by the Worcester Automobile Club, on famous Dead Horse Hill's mile long course, Saturday afternoon, June 6, premier honors for the gasoline class went to the Great Chadwick "Six," driven by Willie Haupt, who negotiated the course in 59.4-5, breaking the record of 1:01.2-5, established by S. S. Stevens, of Rome, N. Y., in a 90-horsepower Darracq, in 1906. Haupt's time was, however, lowered to 55.3-5 by L. F. Baldwin in a small steam car of Massachusetts manufacture.

The biggest place winner of the meet was the Thomas-Detroit, which captured four firsts and three seconds. Two of these firsts, for stock cars, 60.1 to 75-horsepower, and the free-for-all for stock gasoline cars, were captured by driver Levi Lorimer, another by J. S. Harrington, who drove his Thomas-Detroit in the free-for-all for amateurs, and the four first was taken by Oliver Light, who won the event for gasoline cars selling from \$2,001 to \$3,000. The Stevens-Duryea was a two-time winner, in both events being piloted by L. H. Hancock. The car was a consistent performer, the time in each event being 1:15.

In the little fellows' class the Maxwell, driven by Wright Pollard, scored a victory over the Ford, driven by H. H. Rogers, by the narrow margin of two seconds, and the Jackson, driven by E. P. Blake, won from the Maxwell and Selden in the class for cars ranging in price between \$1,251 to \$2,000.

The course was in perfect condition. The club had expended hundreds of dollars repairing and building it up, and it was sprinkled with calcium chloride, which did away with all dust. The mile of roadway utilized for the climb was policed by sixty officers, who had very little to do, for, because of a new State law, the course was closed to all traffic during the hours of the race, and the club had closed up its opening and had fenced it off on each side. The climb was also a success financially, as the club was allowed this year to

charge an admission to points of vantage along the course.

Weather conditions were ideal, and the automobiles owned the city for the day. More than 20,000 spectators lined the course throughout the afternoon. The climb was the Mecca for thousands of automobiles from all over New England, and it was easily the biggest and best the club has yet conducted, and the announcement that the club intends to make it an annual affair is most welcome.

There was but one protest. The Peerless people protested the Big Six Stevens-Duryea, on the ground that its body was not a stock body. The protest was upheld, and the car barred from the stock car event. However, in one stock event the Little Six Stevens-Duryea went in and trimmed the Peerless entry by two-fifths of a second.

Not an accident marred the running off of the events, which were cleaned up in good season. Barney Oldfield's nonappearance was a dis-

appointment to many enthusiasts, but it is supposed that the accident in which he and his wife and others figured in Lowell last Sunday night was what prevented him from coming.

A noticeable feature of the gathering of more than fifty cars of all sizes that comprised the entries was the fact that there was but a single representative of the air-cooled type. This was the 16-20-horsepower Cameron, and the manner in which it performed on the mile rise served to bring it strongly into the limelight, as it made the climb in 1:45.2-5, which is the record for gasoline cars up to 20-horsepower. The summaries:

GASOLINE STOCK CARS 60.1 TO 75 H.P.

Car	H.P.	Driver	Time
Thomas Detroit	40	Levi Lorimer	1:15
Peerless	57	J. B. McKinney	1:15 3-4

COMING EVENTS IN WILLIAM PENN'S BURG.

PHILADELPHIA, June 8.—Interest in the *Public Ledger's* tournament in the Poconos, scheduled for June 24, 25, 26 and 27, has increased here with the elimination from the table of fixtures of the various hill-climbs hereabouts. When the Orphans' Day stunt, next Wednesday, and the Quaker City Motor Club's first track meet of the year, scheduled for next Saturday, are out of the way, the Monroe countyites' carnival will have a free field. A little mix-up with the Norristown Automobile Club, due to a conflict with its Skippack hill-climb on the 27th, was side-stepped by transferring the Delaware Water Gap open and the Canadensis amateur hill climbs to Thursday, thus allowing prospective entrants ample time to take in both.

Peerless and Driver McKinney Ready for the Start.

Waiting at the Foot of the Hill for Starting Signal.

THINGS THAT ARE GOING ON IN CLUBDOM

NEWS OF SOME OF THE CONNECTICUT CLUBS.

HARTFORD, CONN., June 8.—The Automobile Club of Hartford will conduct a series of gymkhana games at Charter Oak Park, June 19, in connection with the Hartford Hospital Benefit. H. P. Maxim and C. H. Gillette have nearly completed the details, and everything points to the complete success of the occasion. It was part of the original plan to hold races on the celebrated Charter Oak track, but the condition of the course at this time does not make this feasible.

The first hill climb of the recently organized Automobile Club of Rockville promises to be a lively affair. There have been promised up to date the following cars: Isotta, Stearns, Simplex, Mercedes, Columbia, Pope-Hartford, Knox, Mitchell, Maxwell, Ford, Oldsmobile, Thomas, Packard and Franklin, and the chances are good that Bernin's Renault will negotiate the straight-away course June 30. H. P. Maxim will be starter, and C. H. Gillette referee. In all probability the Hartford club will conduct a run to the hill. The winners of perfect scores in the recent endurance run conducted by the Automobile Club of Hartford are each to receive a bronze medal containing a fac-simile of the Kohn trophy. This was presented by Albert M. Kohn, of the House Committee.

The sign post committee of the Automobile Club of Hartford will post the road to Worcester by way of Rockville. The main route from Hartford to Worcester by way of Springfield is now undergoing repairs above Palmer, which necessitates a detour from the main highway. Many tourists have cut out Hartford altogether in consequence, and but few of them are aware that Worcester and Hartford are to be reached by the Rockville route. The committee will also post various other routes throughout the State.

A. C. A. TO HOLD SERIES OF PLEASURE TOURS.

NEW YORK, June 8.—According to an announcement made by the Bureau of Tours of the Automobile Club of America yesterday, the club will hold the first of a series of tours from June 19 to 28, the "ideal tour" route of New England having been selected for the first run. From New York the first day's itinerary takes the tourists to Waterbury, Conn., thence to Manchester, N. H., on the second day, and from there to Sunapee Lake at the close of the third day. Bretton Woods will be the goal on the fourth day, and the tourists will stop over a day there. On the fifth running day the night stop will be Poland Springs, Me., while the next day's run will take the tourists into Boston, where another one-day stop will be made. Two days will be consumed on the run home from Boston, Waterbury, Conn., again being made the stopping place for the night. A plan has been devised to avoid the dust nuisance as much as possible, and details of it will be published later. In the morning of each day the low-powered cars will be sent away first, then the medium-powered and lastly the heavy cars, while after lunch the order of starting will be reversed. There will be no entry fee for the tour, as it is simply for pleasure.

TOLEDO CLUB BEGINS GOOD ROADS CAMPAIGN.

TOLEDO, O., June 8.—At a dinner given at Bowling Green, O., last week, nearly a hundred city and county officials gathered together at the invitation of the Automobile Club of Toledo to talk over the problem of good roads. Officials representing the city of Toledo, Lucas, Wood and adjoining counties, as well as smaller towns attended at the Hotel Milliken, to discuss the best methods of road building and improvement. It was decided to postpone definite action until a later meeting, which will be held in the near future. The club went on record as being utterly opposed to reckless driving and scorching.

HOW PITTSBURG GAVE ITS ORPHANS A RIDE.

PITTSBURG, PA., June 8.—About 750 orphans of Greater Pittsburg enjoyed a long ride which the Automobile Club of Pittsburg gave them in 104 autos which were provided for the occasion, Wednesday, June 3. A clear, fair day made the event one of the most enjoyable the little folks have ever taken part in. At 10:30 the automobiles proceeded to the different institutions and gathered up the children and were at Carnegie Lake for lunch.

The procession of automobiles attracted much attention as it passed through the main streets of the city. One of the pleasing events of the day was the meeting with Speaker Joseph G. Cannon of Illinois, who was touring Pittsburg in the car which had brought him from Washington. He made a neat little speech to the children, and in return was greeted with rousing cheers as a candidate for the Presidency. The children were taken through all the parks of the city under the guidance of Edward Kneeland and George E. Painter, who with Chief Ordinance Officer Murray A. Livingston acted as escorts for the crowd.

ACTIVITIES OF THE TWIN-CITY AUTO CLUBS.

MINNEAPOLIS, June 8.—One of the latest innovations introduced by the Minneapolis Automobile Club is a registration bureau for drivers. Whenever a man applies for work, he registers, and his record is then looked up and the membership of the club kept posted as to those applicants that are desirable, or otherwise. June 12 has been set down as the date of the first annual celebration of Orphans' Day. Preparations are being made to entertain 400 children, and in addition to the parade and ride through the Twin Cities they will be taken out to Lake Minnetonka and given a real country picnic day. The club has also made arrangements to carry the delegates to the national convention of park commissioners, which convenes here in August, on a trip through the parks.

The St. Paul Automobile Club's headquarters now boasts of a novelty in the shape of an up-to-date Chinese restaurant, presided over by a slant-eyed chef.

ROCHESTER CLUB BEGINS A LIVELY PROGRAM.

ROCHESTER, N. Y., June 9.—Beginning to-morrow, a seven-day, non-stop endurance run will be held, under the auspices of the Rochester Automobile Club. The route covers a circuit of practically eighty miles, and takes the contestants through the center of the city twice on each round trip. A penalty of two points for each minute the engine is stopped will be incurred, and one point for every minute consumed in making other repairs, with the exception of tires. The contesting cars, all of which have been entered by local concerns, are the Gearless, Mora, Selden, Thomas, Mitchell and Studebaker.

This is only the opening of more than a month's activity, as the club has entered a team in the A. A. A. Reliability tour, and has also planned a big run to the Buffalo convention July 8. The celebration of Orphans' Day has been postponed to August 1. The membership of the club is now 481, and Secretary Bert Van Tuyle is confident that the 500 mark will soon be passed.

VIRGINIA ADDS TO ITS GROWING CLUB LIST.

SUFFOLK, VA., June 8.—The latest addition to the rapidly growing list of automobile clubs in this State is the Automobile Club of Suffolk. It was organized here last week with the following officers: President, C. A. Shoop; vice-presidents, W. N. McAnge and B. L. Saunders; secretary and treasurer, R. L. Gaskins. The club will devote its endeavors largely to the matter of road improvement, which is badly needed in this section.

ACTIVITY IN FRANCE'S GRAND PRIX PREPARATIONS

PARIS, June 1.—In all probability there will be 52 cars in the Grand Prix on the Dieppe circuit, July 7, for Porthos has just put in a third car, at double fees, and both Rochet-Schneider and Mors are expected to enter full teams of three each. Even without any additions the number stands at 46, which is a record in point of numbers, last year's Grand Prix uniting 38 cars, and the speed test of 1906 bringing together 34 competitors. Taking the two events together, it is by far the largest automobile race gathering ever held on a course, the total entries for July 6 and 7 reaching no less than 114, of which 62 are in the voiturette contest. At a time when touring competitions in Europe are, with one or two rare exceptions, failing to attract entries, this is strong proof of the popularity of racing, the announcement of the conditions of the race a long time in advance being responsible for the record entry.

Practically all the racers are on the road. Though drivers on the whole did not receive their 1908 cars until the end of May, they have by no means been idle, every European connected with the Grand Prix having been out on last year's models or on fast touring cars since the middle of February. Szisz, of the Renault team, as soon as he received his Grand Prix racer, immediately set out for trial trips in the neighbourhood of Orleans. Caillois and Dimitri, who will complete the team, now have their machines on the road.

Externally the Renault racers are identical with those of last year, and it is only by close examination that differences can be detected. As a matter of fact, however, they are entirely original cars, the regulations making it impossible to make use of 1907 racers in any way.

All three Bayard Clement racers are on the road in the hands of Rigal, Gabriel, and Hautvast. Hemery was one of the first to receive delivery of a racer, and has his Benz thoroughly tuned up already. Heath, Farman and Cissac have just received their Panhards, chain-driven machines differing entirely from the hook-nosed racers with radiator on the dash which failed to

finish last year. Nazzaro, Lancia, and Wagner, still looked upon as the most formidable team, are believed to be yet waiting for their new cars. Not much can be learned of the Fiat racers, but from the fact that Wagner is still around Paris his 1908 racer cannot be ready.

It is quite probable that a second tire and gasoline station will be established on the Dieppe circuit in order to diminish the risk of any car being left stranded through lack of tires or any tool. Last year all work had to be done opposite the grandstand, in full view of the spectators, and it was intended to repeat this plan. Competitors, however, have complained of the distance, and the Sporting Commission is considering the advisability of establishing a second station at Fresnay-Folny, about half way round the course.

According to the supplementary regulations just issued by the Automobile Club of France, Grand Prix racers must be presented for weighing in July 3 and 4 between 8 A. M. and noon and 2 and 7 P. M. Verification of the cylinder bore can be made at any time and place, on giving notice to the Sporting Commission after July 1. When they have been examined and found correct each cylinder will be stamped in a suitable manner and spare cylinders may be treated in the same manner.

At the weighing-in shed near the starting point the cars will be placed over a bed of sawdust and the engine run at full speed for a few minutes in order to verify the exhaust. If the sawdust is disturbed the exhaust pipe will have to be altered, until no disturbance is created, or if that is impossible the car will be disqualified. Where the maximum weight of 1,100 kilos is not attained by the car with its lightest set of tires, without water, oil, gasoline or spare parts, the amount must be made up by the addition of a bag of ballast sealed and attached to the car by a lead seal. At the end of the race the first four cars must have their cylinder dimensions verified and their carbureter and inlet pipe examined to ascertain that no "doping" has taken place.

THE THOMAS GRAND PRIX CANDIDATE ARRIVES AT DIEPPE

DIEPPE, FRANCE, June 3.—America's only team in the Grand Prix has arrived here and is now making arrangements for a center near the course from which to train for the race of July 7. Harry S. Houpt, who is accompanied on his European trip by Mrs. Houpt, and their niece, Miss Dorothea McCartmey, is acting as race manager and trainer and believes that he will have five weeks in which to prepare the Thomas car and it should make a great showing. A mistake which has been made by every previous American entrant in a European race is too late arrival on the ground, with the result that the cars have never been properly tuned up and drivers have had an imperfect knowledge of the course. Even with this early arrival, the Thomas racing car will not be allowed on the course except on a few special days yet to be appointed by the Racing Board, that authority having rigorously barred everything but stock touring cars from the Dieppe triangle.

Changes were made at the last moment in the composition of the Thomas team, the men who came over on the *Adriatic* being Lewis Strang, who will drive the car; William Knepper, the mechanic, and Montague Roberts, reserve driver. In addition two skilled mechanics from the factory are with the party. Strang has had some experience of the Dieppe course, for last year he was here as mechanic for Walter Christie, who, to tell the truth, failed to impress the Frenchmen with the speed qualities of his front-drive vehicle. Knepper, the mechanic, was

last in France for the 1905 Gordon Bennett race in Auvergne, when he accompanied Herbert Lytle on the Pope car, which had the distinction of being the first American automobile to officially finish in a European speed test.

French Makers Don't Care for Fuel Race.

PARIS, June 3.—French constructors do not appear to appreciate the efforts of their national club to provide them with a fuel consumption race for touring cars, the Coup de la Presse having closed with but 16 cars engaged. Last year a week's preliminary touring was followed by a long distance speed test on the Lisieux circuit in Normandy. This year the touring portion has been abandoned, the cars being required merely to prove their speed and economy in a two-day race on the Dieppe circuit, August 3 and 4. The cars engaged comprise teams of three from Peugeot, Cottin & Desgouttes, De Dion, Benz, Gobron, and a single car from Westinghouse. As will be seen, all are French with the exception of the Benz. The fuel allowance is 19 liters per 100 kilometers, which works out at the rate of approximately 15 miles to the gallon.

A similar event for small cars to be held on the same circuit on a preceding day has united but ten engagements, three being from Berliet, two from Peugeot, two from De Dion, and one each from the Vinot, Gladiator, and Rebour. These smaller cars are allowed 10 liters per 100 kilometers, or equal to about 28 miles to the gallon.

POPE RECEIVERS MAKE FAVORABLE REPORT.

HARTFORD, CONN., June 8.—The receivers of the Pope Manufacturing Company, Albert L. Pope, George A. Yule and Albert J. Tamlyn, have filed a petition to Mahlon Pitney, chancellor of the State of New Jersey, setting forth the results of business since their appointment and asking that they be authorized to manufacture 700 Pope-Hartford cars of the 1909 model, also 50,000 bicycles. In response to this petition the stockholders and creditors of the company are cited to appear in the chancery chambers at Newark, Wednesday, June 17, at 10 A.M., to show cause, if any, why the receivers should not be authorized as mentioned above. It goes without the saying that Hartford interests desire the granting of the petition.

The outlook at the Pope No. 1 plant at this time is very encouraging. The receivers state that 500 machines of the 1908 Pope-Hartford model have been built and 400 have already been shipped and the balance will be out shortly. An inventory of the property in their possession and the disposition made of it is also given. The report shows that the operations of the Hartford plant since the appointment of the receivers up to May 1 have resulted in a net profit of approximately \$215,890.20, and the profits for the year ending on July 1 are estimated to be \$405,022.80. The profits of the Westfield factory net \$35,797.49, and the profit for the year is estimated to be \$69,399.47. The factory at Hagerstown, Md., according to the receivers, has been operated at a profit, which up to May 1 amounts to \$17,546.85. The factories have been disposed of in Illinois, two of which netted \$236,000.

MRS. TEAPE AND DAUGHTER NEAR OMAHA.

The first stage of the transcontinental trip which is being made by the two ladies who are touring from Portland, Maine, to Portland, Oregon, was completed with their arrival in Chicago on June 1. Leaving Portland, Maine, on May 14, in an 8-horsepower Waltham-Orient runabout, Mrs. E. E. Teape and her daughter, Mrs. Mackelvie, inaugurated the first attempt of a transcontinental tour by women. The trip from Portland to Buffalo was uneventful, but beginning at Buffalo the road conditions after the recent rains made traveling very heavy and burdensome. This was especially so in Ohio and Indiana, where in some instances not more than four miles an hour could be made.

In writing of the trip, Mrs. Teape was enthusiastic over the treatment which she received from autoists, calling attention to the good-fellowship which existed. In nearly every instance pilot cars and guides were willing to put them on the right road, without loss of time or annoyance of misdirection. The tourists left Chicago June 2, headed for Omaha. When the condition of the roads is considered, the fourteen days from Portland to Chicago is most remarkable time, and Mrs. Teape is confident that she will be able to reach Portland, Oregon, by July 1.

INDIANIANS CELEBRATE AUTOMOBILE DAY.

CRAWFORDSVILLE, IND., June 8.—Under the auspices of the Commercial Club, automobile day was observed here last Thursday by several hundred automobile owners and their friends. The main feature was a parade during the afternoon, covering several blocks in length. There were visiting drivers from Kokomo, Frankfort, Indianapolis, Lafayette and South Bend in large numbers, Kokomo alone sending about fifteen automobiles. Prizes were awarded to winners of the various events.

Edgar Apperson of Kokomo, driving his four-cylinder Jack Rabbit, won the hill climbing contest, the egg race and the four blocks sprint. The Indianapolis Motor Car Company of Indianapolis was awarded two prizes on their Rapid Pullman, which was the largest car in the parade and also carried the most passengers, having forty-three passengers on board. Frank Sweigert of Kokomo was adjudged the best gentleman driver, and won the obstacle race, there being a number of other events of interest on the program as well.

GREAT WESTERN SHOULD HAVE HAD CREDIT.

ALBANY, N. Y., June 8.—In reporting the hill climb held under the auspices of the Albany Automobile Club, on Menands hill, May 23 last, an error crept into the report which was published in THE AUTOMOBILE a few days later. This was in the issue of May 28, page 763, and in Event 8, which was for gasoline touring cars up to \$1,250, it was stated that Cadillac was the winner. This was an error, as there was no car of this make entered in that event, the only contestants being a Great Western car, made by the Model Automobile Company, Peru, Ind., and which carried the number 12, and a Buick. The former won in 1:36, while the second entrant could not do better than 2:40. The injustice of the error is the greater as this \$1,250 car bettered the times of several other cars ranging from \$1,700 to \$2,500, from 3 to 9 seconds.

CORBIN WAS A WINNER AT ALBANY.

In the account of the very successful hill-climb held under the auspices of the Albany Automobile Club on Menands hill, May 23, mention of the event for runabouts ranging in price from \$2,000 to \$3,000 was inadvertently omitted altogether. The error was a great injustice to the Corbin, the winner in this class, as its time of 1:02 1-5 was not alone much better than any of its competitors in this event, but also lowered the times of all but the first to finish in the \$3,000-and-over runabout class, and all but the first and second to finish in the free-for-all runabouts, some of which listed at \$5,000 or over.

PREST-O-LITE FACTORY AGAIN BURNS.

INDIANAPOLIS, IND., June 8.—For the third time in less than a year the local plant of the Prest-O-Lite Company was damaged by a series of small explosions Saturday. While the loss to the plant was small, the damage to buildings in the neighborhood, including St. Vincent's Hospital, was much larger. The cause of the explosions has not yet been determined, according to Carl G. Fisher, of the Fisher Auto Company, who, with James A. Allison, owns the plant.

The loss on the Prest-O-Lite plant is estimated at from \$1,000 to \$2,000. Other losses have not been fixed.

RESULTS OF WASHINGTON ENDURANCE RUN.

WASHINGTON, D. C., June 9.—The Thomas-Detroit won the cup for the lowest score made by a touring car in the 164-mile endurance run of the Washington Automobile Club, which was run to-day. The Stearns finished first in the roadster class, while the Ford and Buick runabouts were tied in the third division. The course lay through three States, Maryland, Virginia and West Virginia, and included some of the roughest roads in the eastern section of the country.

STEARNS DRIVER LEINBACH IS BANQUETED.

BALTIMORE, MD., June 8.—E. L. Leinbach, who piloted the Stearns car to victory in the 100-mile race at Pimlico, on Decoration Day, was the guest of honor at a dinner given to owners of Stearns cars and their friends by President John H. Schaab, of the E. L. Leinbach Automobile Company, local agents for the car. The dinner was held at Mount Holly Inn. The cup won by Mr. Leinbach was on exhibition, and was greatly admired.

REO COMPANY CUTS ANOTHER MELON.

LANSING, MICH., June 5.—A dividend of 40 per cent. has just been paid by the Reo Motor Car Company of this city to the company's stockholders. This is the second dividend of the year, the first, of 20 per cent., having been paid on April 18. This makes a total of \$600,000 paid in dividends so far this year on the capital stock of \$1,000,000. The company is now making thirty cars per day.

Fording Southern Streams in Canvas Protected Franklin

Salesman L. E. Hoffman has driven this 1908 Type D Franklin demonstrator over 10,000 miles, visiting all Franklin dealers in the South. Fording streams in that territory is so frequent that he has a canvas bag affair that he slips over the front end of the hood to prevent water splashing on the motor.

QUAKER CITY NOW HAS TAXICAB SERVICE.

PHILADELPHIA, June 8.—Last Monday, with ten Thomas vehicles, the first taxicab service was inaugurated here, operations being confined to the various local stations of the Pennsylvania railroad until the advent of additional permits an extension of the service. The public took to the innovation immediately, and there were few intervals of rest, either day or night, for the drivers. Headquarters for the taxicab service have been established at the big new garage of the Bergdoll Motor Car Company, at Broad and Wood streets, and the management has been placed in the hands of Robert A. Parke, former manager of the taxicab branch of the Thomas factory, and who later established the taxicab service in Washington, D. C.

The rates of fare are considered decidedly moderate. Thirty cents is the charge for the first half mile, not exceeding four persons, and ten cents for each additional quarter mile, with a charge of ten cents for each six minutes of waiting. Trunks and packages carried outside call for additional payment of 20 cents each. There is no charge for calls within a radius of half a mile of the cab stand; outside that limit the charge is 20 cents a mile. Passengers dismissing a cab less than three miles from the stand are not charged extra; over the three-mile limit there is a charge of 20 cents for each mile or fraction thereof in excess of that distance. The innovation is already making heavy inroads on the business of the horse-drawn cabs, and the popularity of the taxicabs is increasing daily.

Packard Testers Celebrate Completion 1908 Output

When the last of the Packard 1908 cars were given their final test the testers celebrated the occasion and emphasized the fact that they had completed the year's output of 300 more cars than were made in 1907, twelve days ahead of schedule time.

PICKED TO SUCCEED WALTER WHITE.

CLEVELAND, June 8.—Walter Rheineck, a slightly-built young lad scarcely out of his teens, is slated to step into the shoes of Walter White as a racing driver, according to the local White people. For some time past Rheineck has been traveling with White as his mechanic, and has thoroughly mastered the car. He has nerve in abundance, and it is thought will make an admirable driver. It is quite probable that he will be given his chance in the local hill climb June 13. Rheineck, up to about a year ago, was one of the star track athletes at Central high school, where he captained the track team. He has never been particularly strong, but is a bundle of grit and nerves.

PREMIER 100-MILES-A-DAY PROGRESSES.

INDIANAPOLIS, IND., June 8.—The Premier Motor Manufacturing Company expects to run one of their four-cylinder models 10,000 miles by September 1. With the slogan "100 miles a day for 100 days" the car left Monument Place, in this city, last Monday morning. Joe Moore, one of the veteran Premier drivers, is driving, and prospective purchasers are acting as observers from day to day. The daily run is to be made despite weather conditions, and with no attempt to establish a speed record.

Premier Model 30 Century Car Starting 100 Days' Run

Last Monday the car, after being started by Chief of Police Robert Metzger, ran to Dublin to meet the Glidden Pathfinder, driven by Ray McNamara. On Thursday George Weidley and some friends rode in the car to the automobile show at Crawfordsville. The run is attracting much attention.

NEW RELIANCE COMPANY BUYS OLD ONE.

Owosso, MICH., June 8.—The Reliance Motor Truck Company of Owosso has purchased at a receiver's sale the business and assets of the old Reliance Motor Truck Company of Detroit, and the business will be hereafter carried on in Owosso. The new company has been incorporated with a capital of \$250,000, of which \$150,000 has been subscribed and mostly paid in by local citizens. A manufacturing plant will at once be erected here. The officers of the company are: President, Fred O. Page, Detroit; vice-president, A. M. Bentley, Owosso; secretary and treasurer, W. F. Benkelman, Owosso.

PICNIC AND PARADE OF OLDSMOBILISTS.

Gen. John J. Cutting will promote the third annual reunion of Oldsmobilists on June 20. It will embrace a parade and a picnic at the Columbia Oval Cricket Club grounds. Oldsmobile owners present with their cars will draw for the choice of an Oldsmobile \$3,000 palace touring car, or gentleman's roadster.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The National Motor Vehicle Company, Indianapolis, Ind., has canceled its distributor's arrangements with the Ralph Temple Auto Company, Chicago, which has handled the line for several seasons. Other arrangements for representation have not yet been made.

Reports in regard to European racing events this season show that a long string of victories is being credited to cars with Continental tires. Included in the series is a race at the Brooklands track for 90-horsepower cars, in which D. Resta came in first with a 76-horsepower Mercedes in the phenomenal time of 93 miles an hour.

In making mention of the changes in the sales management of the Spare Motor Wheel of America, Ltd., in *THE AUTOMOBILE* last week, it was inadvertently stated that the sales department at 237 Michigan avenue, Chicago, was a branch house, while, as a matter of fact, this is the main office of the company. The factory is located at St. Anne, Ill.

Protests filed against E. Linn Mathewson, who won the Rocky Mountain Cup race with a Thomas-Detroit Forty, have been decided adversely by the official committee. The protest was based upon the claim that the Thomas-Detroit Forty *Blue Bird*, in which Mathewson won the race, was not a stock car. Mathewson immediately demanded that the car be examined by a committee of experts. The committee made a report in Mathewson's favor.

Consistent with the faultless performances of Pennsylvania tires in the most important racing events of this season was their triple victory at the Pimlico track races near Baltimore on Decoration Day. E. L. Leinbach, in a Stearns 60, equipped with Pennsylvania tires, not only won with ease the 100-mile championship event against one of the strongest fields ever entered, in 120 minutes 27 seconds, but also captured the Pimlico handicap from scratch as well as the 5-mile race for stock touring cars.

The Warner Instrument Company, of Beloit, Wis., manufacturers of the Warner Auto Meter, have presented the New York Automobile Dealers' Association with a beautiful silver challenge trophy, to be competed for in the Trade Association's bowling league this fall. The bowling league will consist of at least ten teams, and alleys at the corner of Thirty-fourth street and Broadway have been secured. It is the intention of the Warner Instrument Company to offer duplicates of this trophy for competition in Boston, Philadelphia, Chicago and elsewhere, among the various local automobile dealers' trade associations. The trophy is for a perpetual challenge game.

The Garage Equipment Company has moved its factory to Milwaukee, about ten thousand square feet of floor space having been secured for the manufacture of their line. A large quantity of new machinery has been installed, and, while the company is practically thirty days behind with orders at present, it is positive that within a few weeks it will have caught up with back orders. This company is just placing on the market a new horn valve, and is also making a valve of the same type, having a cut-out in connection. This can be used on any exhaust pipe, and a whistle or horn can be attached. It also has a muffler cut-out in it, making it a four-way valve.

One of the most striking features of the perfect score results of the 150-mile cross-country reliability run of the Indianapolis Automobile Dealers' Association was the performance of the Rapid sight-seeing 'bus with its load of twelve passengers. The car was primarily designed for use at comparatively low speeds and on well-paved streets of a city, so that compelling it to keep a schedule of 16 miles an hour over country roads with its full load up was something considerably out of the ordinary. It was driven by an eighteen-year-old boy, who, moreover, did not know much of the road, but succeeded in bringing the Rapid through with a clean score.

More than two thousand Rambler cars have been sold throughout the Western Hemisphere since the first of last November, and Thomas B. Jeffery & Company announce in the "Nineteen-Eight Success Number" of the *Rambler Magazine* that they have not, so far, received a single complaint nor have they had to replace a single broken part. This is perhaps one of the most remarkable records of performance in the history of the industry, when it is considered that 1908 Ramlers have, as the maker says, been delivered to nearly every State in the Union. It proves that the day of the standardized car of absolute reliability is rapidly drawing near. The sales of the Rambler began immediately after the New York shows, and although New England and the Eastern States have taken their share, the bulk of the output has gone into the Middle and Far Western States.

A party was being shown through the factory of the Ford Motor Company by Master Mechanic Wills, and as they went through the assembling department one of them asked how long it required to assemble a car. Calling the foreman, Mr. Wills instructed him to build a car from the ground up. The start was made at 4:30. One group of men assembled the frame, another got the wheels and tires, then the engine, the transmission and the differential were mounted, the radiator placed in position, the body bolted down, the coil placed, the oiler and gasoline tank filled and the car started. Time, 14 minutes. It was a convincing demonstration of the absolute uniformity and interchangeability of parts. The average time per car required to assemble these cars is less than this, as ten cars an hour are turned out every day, but this is done by building a quantity at a time, a set of men for each operation.

Few people realize the extent to which electrically driven automobiles for business and pleasure purposes are being used at the present time. In Chicago alone there are over one thousand electrics used for pleasure purposes, and in such cities as Cleveland, O., Rochester and Syracuse, N. Y., Denver, Col., and Indianapolis, Ind., the number of electrics is very large. The majority of these cars are cared for at garages, and, while the rates charged are not excessive, a considerable decrease is effected when the electric vehicle can be housed on the premises, it being not unusual for a victoria or stanhope to be maintained at a cost of not over \$15 per month, including charging and all repairs. In the majority of instances the current available is alternating, and before utilizing it for charging it is necessary that it be changed to a direct current. Recently a device known as a Mercury arc rectifier has been perfected. It is so simple that anyone can operate it, and

low in cost. The Studebaker Automobile Company, of South Bend, Ind., is selling a great many of these rectifiers in connection with their electric cars, and claim that this device will do much to increase the sale and use of electric vehicles.

The Times Square Automobile Company has just purchased a large number of 1908 Orient buckboards, which they are offering at special prices. Such transactions are not unusual in the automobile trade, and yet it calls to mind the possibilities for growth in this industry. Here is a firm that began in 1903 to deal in second-hand cars only, and only in a very moderate way. To-day they occupy a four-story building in West Forty-eighth street, 50 by 150, with a two-story "L" 40 by 160, facing at 1599 Broadway, New York City, that is stacked from basement to roof with cars, accessories and supplies of every description. In addition, the company's branch store at 1332 Michigan avenue, Chicago, is closely pressing the parent store in volume of business. The company is prepared to buy for spot cash any quantity of new or second-hand cars where price and quality suit them, and the volume of yearly business runs now into the millions. These results are not accidental, but are due to the energy, pluck and sound business methods of which the treasurer and general manager, Jesse Froehlich, is the chief exponent.

PERSONAL TRADE MENTION.

Alexander Howell, who has been representing the Warner Instrument Company in New York City as chief salesman, has recently resigned his connection with that firm to accept a similar position with the Jones Speedometer Company. He will continue to have New York as his territory.

Albert C. Maucher, well known in Philadelphia automobilizing circles by reason of his many notable performances on track and road with the cars represented there by the Quaker City Automobile Company, has just been promoted to the superintendency of that concern.

H. N. Anderson, formerly with the Dayton Motor Car Company, Dayton, O., has just joined the engineering forces of the Speedwell Motor Car Company, of the same city. The latter concern now have a large new plant in course of construction, and its business is now growing very rapidly.

Claire L. Barnes, sales manager of the Detroit Steel Products Company, Detroit, Mich., has tendered his resignation, to take effect in the near future, and will become manager of sales for The Billings & Spencer Company, Hartford, Conn., one of the largest manufacturers of drop forgings, machinists' tools and special machinery in the country. Mr. Barnes has had charge of the sales department of the Detroit Steel Products Company since its organization.

Ernest L. Smith, who is well known throughout the automobile industry, having been connected with the Timken Roller Bearing Company for several years past, has just become identified with the Standard Roller Bearing Company as its western representative. The latter concern announces the installation of a thoroughly equipped laboratory at its factory in Philadelphia. It is in charge of Walter H. Hart, an expert chemist, formerly with the Alan Wood Iron & Steel Company.

INFORMATION FOR AUTO USERS

"Perfection" License Indicators.—To comply with the numerous laws of the different States, the Automobile License Indicator Company, Lewisburg, Tenn., has brought out the device shown in the accompanying illustration. It is known as the "Perfection" license number indicator, and consists of a series of numerals, running from zero to nine, on each one of the five bands shown, while the sixth band at the right hand bears the State name or abbreviation, together with space for the number of the license issued by that State to the holder, as well as its legal speed limit. By loosening the thumb screw and turning the milled nuts at each end, any combination

OPERATING THE PERFECTION HANGER.

of figures up to 99,999 can be made, the type being 4 inches high by 1-2-inch face, while the ribbons of the indicator are made from a good quality opaque fabric which is non-stretchable and waterproof, although it is protected from the weather by a transparent celluloid covering. The same firm also makes the "Standard" license number indicator, which works on the card index system. Pockets take the place of ribbons, the five central ones containing celluloid or paraffine-coated cardboard cards, properly indexed and showing on their faces the ten numerals, zero to 9, while in the two end pockets are carried a series of cards bearing the State names. Changes of numbers and names are very simply and easily made.

Burrowes Number Hanger.—This device is one of several automobile specialties being placed on the market by the E. T. Burrowes Company, Portland, Me. The Burrowes number plate hanger is designed to be attached to the steering rod, axle or other convenient place, and the screw clamp draws it so tight that it cannot shake, rattle or wear the paint off the part to which it is fastened. Rattling is further prevented by a continuation of the strap, which forms a leather lining for the hook *F*. This hook is made of steel, and prevents the loss of the plate. The neat appearance of the hanger will be apparent from the accompanying illustration.

NUMBER
PLATE

BURROWES
ATTACHMENT.

Hydro Pneumatic Springs.—This is a device utilizing the combined resisting forces of air and oil, and is intended to take the place of the usual spring suspension. It consists of two cylinders, telescoping within one another. One of these holds a quantity of oil, while the second, or upper cylinder, contains an air chamber, in which the pressure may be regulated to suit the weight of the car. A clamp forming an extension of

the lower cylinder is attached directly to the axle of the car, while the upper cylinder is bolted to the frame. The two cylinders are kept in accurate alignment by means of a special guide working through an outside bearing. The device is extremely simple and very effective in action. At first the oil absorbs more or less of the air and a little of the pressure is lost, but after this has been restored by a few strokes of the pump the device will give good service for the entire season without further attention. At the end of the season's running it is merely necessary to replace the oil, as it tends to gum in combination with the air.

Running Board Sets.—In order to provide greater comfort on the small Ford, Maxwell, Reo and single cylinder Cadillac runabouts, the Jenkins Specialty Manufacturing Company, Sumter, S. C., has brought out sets of running boards designed to fit these various small cars. They are made of the best grade seasoned poplar, which is noted for its light weight and strength. After careful seasoning, they are painted all over to keep out moisture, and are then covered with the best grade of Goodrich rubber in red or gray, and are finished with attractive brass binding specially designed for this purpose. The supports are made of pressed steel in attractive designs.

SPECIAL RUNNING BOARDS FOR RUNABOUTS.

The same firm also makes a line of slip covers in linen or khaki, for the same cars, as well as chain boots of leather, hoods, mud splashes, under pans of hard fiber and the like.

Brown Four-cycle Compressometer.—This is a handy little instrument made by The Brown Company, Syracuse, N. Y., and is designed to enable the compression of a motor cylinder to be obtained very simply and conveniently. It is a matter of common knowledge that loss of compression is one of the most frequent causes of lost power, and the use of the Compressometer will readily show exactly which cylinder is at fault. It is particularly essential that the compression of the various cylinders of a multi-cylinder motor should be uniform, and the Compressometer offers a ready means of determining this. It is only necessary to screw it into the cylinder in place of the spark plug, turning the motor over by hand, when the gauge, which is calibrated in pounds per square inch, will immediately show the pressure. But the motor should not be run with the instrument in place. The reading of the maximum hand with which the instrument is equipped

will show how high the pointer goes without the necessity of watching it. The Compressometer is equally valuable for marine use, as it can be employed to test the vacuum in the crankcase of a two-cycle motor, thus readily detecting crankcase leaks. The Brown Company having just brought out a special combination instrument for this purpose. The crankcase vacuum and pressure are taken from the base by a 1-8-inch nipple, while by inserting it in the cylinder head in the usual manner the maximum compression is registered.

Shaler Electric Vulcanizers.—There is nothing to which the old adage about the stitch in time applies with so much force as to repairs to pneumatic tires. By promptly repairing all cuts and holes,

SHALER ELECTRIC VULCANIZER IN USE.

a set of tires may not only be made to last twice as long, but will be in a dependable condition throughout their life of service. To make it possible to do this, the C. A. Shaler Company, Wau-pun, Wis., manufacture a handy electric vulcanizer, which is simplicity itself and may be used by the autoist or garageman without any previous experience in the repairing of pneumatic tires as the makers supply explicit directions as well as the necessary materials. There is no risk of injuring the tire, as the heat may be positively controlled so that the vulcanizer requires but a minimum of attention and does not need to be watched.

Coates Auto Buffing Outfits.—There has been a demand for a power-driven buffing outfit for keeping the bright work on a car clean, and while the electric type manufactured by the Coates Clipper Manufacturing Company, Worcester, Mass., has met with tremendous sale, the expense where alternating current was used was sometimes prohibitive. To overcome this, the same makers have just put a friction-driven outfit on the market. It is run by friction from the rear wheel, the latter being raised by a jack, while the roller is held in position by a patented device designed for the purpose. To save the expense of a long flexible shaft, a jointed rod is supplied for the greater part of the drive, the remainder being through a Coates patent flexible shaft.

HOW THE COATES AUTO BUFFING OUTFITS ARE EMPLOYED FOR POLISHING.

THE AUTOMOBILE

One of the Improved Highways in Whatcom County, in the Northernmost Part of the State of Washington.

TO MY COMRADES IN THE GOOD ROADS CAUSE:

The enthusiasm with which I worked with you and for you during the years that I was in the Government Highway Service has not been quenched through disuse. The need is still as insistent and the cause as worthy as it was while I was actively working.

James W. Abbott.

There is no shade of question in my mind that through the automobile is coming the success which is going to crown all the efforts of those laborious years.

I believe that if every man who owns an automobile in the United States and who prays to God for better roads to drive it over, would assist insofar as he might in the work for good roads the result would be effective beyond any of our comprehensions.

It has been with the earnest wish to add my mite to this effort that I have taken from my work time which I could

afford to give to prepare this series of articles. It has been a labor of love for the cause I love in the hope that some good might come of it. Most cordially yours,

James W. Abbott
 Ploche, Nev.,
 June 1, 1908.

DURING the years in which I represented the United States Government in its work for highway betterment throughout this region, I centered my efforts upon two plans which I believed would be the most effective in securing the desired results.

The first of these was to get instituted generally in all the counties of these Pacific Coast States practical methods of utilizing the activities of convicts in road construction. The second was to arouse a public sentiment which should finally recognize the importance of a first-class highway, leading from British Columbia to Mexico, approximately parallel to the coast line.

The argument for the use of the convict in road construction may be briefly stated as follows: We restrain the criminal of his liberty for the benefit of society. To obtain enduring, beneficial results, our penal methods must be corrective rather than punitive. The fear of an avenging law is an influence of minor importance in deterring crime. The strongest impulse for good conduct is good character. Moderate, healthful exercise of body and diversion of mind will prevent the normally good citizen whom mischance has brought within prison walls from lapsing into a criminal, while it will restore normal health to many perverted natures.

The building of public works which could not otherwise be undertaken is the sole occupation in which convicts can be employed which will not only not encroach upon free labor, but which will actually immeasurably increase the demand for the services of free labor, benefiting at the same time the criminal and the free man, and tending to an elevation of moral standard throughout the community.

No influence more destructive upon character can be imagined than enforced idleness; while to allow the activity of the convict to be employed in making products for sale at prices below the normal market is degrading to American labor.

There is no character of public improvement of such general importance to all the people as making improved highways. The activities of our convicts throughout the country constitute in the aggregate an enormous force, and I believe that one of the most vital problems of our civilization lies in solving the question of how to use these activities most effectively in constructing highways.

I made an exhaustive study of every method attempted along this line in the United States. In Washington and Oregon I

centered my efforts to get policies adopted which should more and more, as time went on, employ these activities for the construction of highways. My recent visit to Washington and Oregon was the first which I had made in somewhat over two years, and I was overwhelmingly astounded and gratified at the progress which has been made in those States during that period.

Upon the 9th of March, 1907, the following legislative enactment became the law in Washington:

All convicts confined and not otherwise employed shall be employed under authority of the State Board of Control, in charge of the superintendent of the penitentiary, or of such other persons in the employ of the State as the State Board of Control shall direct, in the building of State roads in this State. All expense of whatever nature incurred through such employment shall be paid from the fund appropriated by the State legislature for the construction of the particular road or roads upon which such convicts may be employed. The places where and the manner in which work shall be performed upon the said roads by such convicts shall be designated by the State Highway Board.

The same Legislature appropriated the sum of \$225,000 to be used in the construction of twelve roads specifically defined. One of the roads thus provided for in Okanogan county was

Convict Camp at Kelly Butte Stockade, Oregon.

selected for making the first experiment with convicts under the law above quoted. The unqualified success of this experiment in all ways is calculated, in my judgment, to lead to results for road betterment more far-reaching than any other enactment ever placed upon the statute books of this nation.

The report of Joseph M. Snow, highway commissioner of Washington, recently issued, shows that the average value of the daily work of a convict on this road was \$4.03, measured by the bids of contractors before it was definitely decided to use convict labor. Being the first experiment of its kind, the methods and system employed were necessarily tentative, and Mr. Snow says in his report: "With the experience gained, the expense of carrying on this class of work can be materially reduced in the future." He had already figured, charging up all expense of outfit, transportation, supplies, salaries, and engineering to the road fund, that the convict work represented a profit of about 58 per cent. over the bids submitted.

The closing page of his report is, to my mind, the most cheering message to the good roads advocates of the United States which ever has been or ever could be written by any man. It shows earnestness and enthusiasm, and is as follows:

The financial benefit to the public I have shown; and referring to the reformatory influence on the prisoners, it may be said that a glance at the men who have been employed at State Camp No. 1 shows them hale, hearty and well contented, and shows that they have lost the peculiar appearance that comes from confinement in the jail or penitentiary. The camp has been kept in excellent, satisfactory condition. No cases of sickness have occurred, and but one slight accident whereby a man slipped from the face of a bluff and fractured his ankle. Three men were paroled during the season for good conduct, and this had an excellent effect on those remaining. The men who were furnished for this work were not those noted at the penitentiary for a desire to work, but under the exceptional management of George F. Charlot, who has acted as chief guard and superintendent of construction, the men were encouraged to change their methods and developed into a first-class crew of workmen. They worked regularly eight hours each day, losing only two quarter-days on account of inclement weather or other causes during the three months and a half they were at the camp. Each man seemed to take a pride in the work, and all of the men with whom I conversed desired to remain in this kind of employment. They are trusted to such an extent that no stripes were worn and no irons of any description were used. In fact, one passing over the work, not knowing the character of the employes, would never have known that it was a convict crew. It might safely be said that the men employed at State Camp No. 1 left there in far better physical, mental and moral condition than they arrived there. The success of the proposition having been so satisfactorily demonstrated, it is now proposed to place a larger crew on State Road No. 7, known as the Snoqualmie Pass Road, in the early spring.

With reference to the character of the work, Mr. Snow says: "The cuts in solid rock run from twelve to forty-five feet in depth, and the embankment from six to twenty feet in width, the maximum grade on the road being 4 per cent., while the greater part of it is level." The half-tones which accompany the report are very realistic, and, while I have not seen the road, I believe it would be safe to hazard the statement that this road and the Scenic Highway from Las Vegas to Santa Fe, New Mexico, both constructed by convicts, reach the highest standard of mountain road construction ever attempted in the United States.

What Has Been Done in the State of Oregon.

In the State of Oregon, Judge Lionel R. Webster, the county judge of Multnomah county, in which Portland is situated, was always my most effective colaborer for the use of convicts in road building. In season and out of season, for years, Judge Webster fought for the adoption of this policy. In that State all highway matters come under the control of the county judge, and in many respects it has proved to be a very wise plan. County judges, as a rule, are men of high intelligence and keen discernment. They seek the welfare of their constituents, and are earnest in their endeavors to promote the welfare of the counties over whose courts they preside. No higher type of reformer has been raised up by Providence in this country than Judge Webster. He could direct only the employment of the convicts sentenced in his own court, but began years ago with these to evolve a feasible system for utilizing their activities in improving the roads adjacent to the city of Portland.

The first time I went with Judge Webster to see what his convicts were doing, I found them in a crude stockade, breaking rock by hand. It was a poor quality of rock, and, of course, progress was slow and unsatisfactory. But Judge Webster kept at it, and added to the highway system in that county considerable mileage of first-class macadam roads. He labored at Salem with the Governor and with the Legislature, but Oregon Legislatures are not as enlightened as Washington Legislatures, and they are slower to appreciate the importance of the highway question generally.

The State of Washington had, to lead its movement for highway improvement, a great man with unlimited wealth and influence, Samuel Hill of Seattle, the first and only president of the Washington Good Roads Association. He was elected at a convention called by himself in Seattle in October, 1902. Since that time Mr. Hill has devoted his superior talents, indefatigable energies and extraordinary personality to effecting the emancipation of that State from the bondage of bad roads. He has

spared neither time nor money. He secured from the Government that genial good roads enthusiast, Sam C. Lancaster, to come to Washington and engage in a campaign of proselyting. Through his influence, Sam Lancaster has been installed in a permanent chair in the University of Washington, at Seattle, where his sole duties are to teach the students technical methods of road construction. Sam Hill and Sam Lancaster went up and down the State of Washington, preaching the gospel of good roads until they had it fairly set on fire, and out of that campaign came the enlightened legislation which I have previously alluded to.

Judge Webster had little of such aid. The State of Oregon possesses no Sam Hill. No other State in the Union possesses a Sam Hill. It is one hope in which I have indulged for years that there might be other Sam Hills rise up in due time to serve their country as he has served it.

Politics and roads never have closely coalesced, and Oregon has thus far proved no exception to the rule. But Judge Webster, by the irresistible force of his earnest character and energetic temperament, has gone forward in the good work. It was to me a most affecting privilege which I enjoyed when I visited the rock quarries at Kelly Butte, seven miles from the county courthouse in Portland. This is the name of an enor-

mous intrusive dike of first-class rock for road-making purposes.

I found at Kelly Butte stockade, bunk houses, messrooms and kitchen, and a complete plant operated by steam power for crushing rock. I found every convict of Multnomah county working industriously, happily and effectively. I found that this rock was being put into condition for making macadam roads and delivered automatically to wagons at a maximum cost of 27 cents a cubic yard, while the entire cost of producing this result was little less than would have been the cost of maintaining and guarding these convicts in idleness. In other words, I found that Judge Webster was producing material for first-class macadam roads practically without cost. The result is the highways leading out from the city of Portland average better than the highways leading out from any other large metropolis on this coast, or it may be west of the Mississippi.

Judge Webster's zeal will not flag nor his efforts be abated. If he lives, it is absolutely certain that, with this plant at Kelly Butte for an object lesson, he will show the people of Oregon the way to most effectively develop their resources. When the people clearly see any great need, they get it. The political puppets in that State will be swept from the stage as a man would sweep a chessboard, and in their place will come men ready and willing to heed the voice of the people.

GOOD ROADS AGITATION IN CENTRAL MASSACHUSETTS

SPRINGFIELD, MASS., June 15.—So far the auto season cannot be said to be on in this vicinity to any great extent, but its rapid approach can be foretold to a certain extent by the good roads agitation that is uppermost at present. Because it is feared that a two-mile stretch of very bad road in Becket known on the Springfield side as Mowrey's hill and Jacob's Ladder on the Berkshire side, will drive automobilists off that route, action has been taken by a special committee of two hotel men from this city and a representative of the Springfield Automobile Club toward raising funds for temporary repairs. Already \$500 has been pledged by hotel men along the route between this city and the Berkshires for the work, which it is estimated will cost about \$720, and it is probable that the Automobile Club in this city will raise the rest of the money. The bad strip of road begins at the Bonnyrigg Four Corners and extends as far as Jacob's Ladder, and has been rendered treacherous and hard of travel because of huge boulders and earth washed down from the mountains by the Spring rains. These repairs will be made pending the building of a State road along this route, a bill for which has been passed in the legislature to take effect next year.

Another action taken by the local club for the benefit of autoists passing this way, was the selecting of a new route to the eastward to take the place of the new State road between

Palmer and Warren, now in process of construction. The necessary signs have been posted showing the new road to be as follows: By way of the Boston road to the Five Mile Pond school house, to Parker street, to Ludlow, to Red Ridge, to Three Rivers, to Palmer, to Brimfield and Brookfield. It is figured that it will be along the middle of July before the State road is completed, but this route will be subject to change as the road progresses.

The local club has been asked by the Hartford Automobile Club to join it in an attempt to get general road improvement between that city and this. The condition of this road has been much criticised and is so bad in some places, mostly in Connecticut, that autoists are being warned away from it and are taking to the shore line on their trips between New York and Boston. The Springfield club, however, has not taken the matter up because, with the exception of a stretch of road three-quarters of a mile long near Longmeadow, the roads this side of the State line are in excellent condition. The strip mentioned as an exception is not so very bad or so very good and will be improved in the very near future. President Mark Aitken, of the local club, expressed the opinion that the State of Massachusetts had done its part as regards the roads in this section and that the club believed it was up to the state of Connecticut to see that its roads were of a character to encourage touring.

AMERICAN COMMISSION TO INTERNATIONAL ROAD CONGRESS

WASHINGTON, D. C., June 15.—President Roosevelt has directed that this nation be strongly and officially represented at the International Road Congress to be held at Paris the week beginning October 11, and credentials have been issued naming Logan Waller Page, Director of the Office of Public Roads of the U. S. Department of Agriculture, Chairman of the Commission. The other members named are Colonel Charles S. Bromwell of the United States Corps of Engineers, now serving as Superintendent of Buildings and Grounds of the District of Columbia, and Clifford Richardson of New York, an eminent chemist and one of the world's acknowledged authorities on bituminous road building materials.

This coming Congress, which will be attended by distin-

guished delegates from every country in the world, is regarded by highway engineers and experts as probably the most important ever summoned for the discussion of an economic question. Its need is the direct outgrowth of the advent of the automobile.

Invitations have been transmitted through the office of public roads to State highway commissioners, city engineers and park commissioners to attend the Congress, and already a large number of delegates have been selected. It is confidently anticipated that this will be but the opening gun of a universal movement for good roads due to the possibilities of their extended use on long runs by means of the automobile, and the presence of an American delegation is certainly an encouraging sign.

ENGLISH CAR DRAWS GRAND PRIX STARTING HONOR

PARIS, June 10.—England drew the lucky number at the Automobile Club of France, thus allowing one of the Austin cars to start first in the Grand Prix on the Dieppe circuit July 7. After the Englishman the first of the Mercedes cars will rush away over the triangle by the seashore, and will be followed by others at intervals of one minute, in the order: Motobloc, Renault, Dietrich, Benz, Fiat, Brasier, Porthos, Opel, Bayard-Clément, Itala, Weigel, Mors. Thomas, with Lewis Strang at the wheel, Panhard, and Germain.

This will end the first series; the second series will be formed by number two car from each of the firms mentioned with the exception that Thomas, having but one car, the second Mors will be followed by a Panhard. The same applies to the third series. Lewis Strang, who came down to the library of the Automobile Club of France in company with Harry S. Houpt and Montague Roberts, found that his usual good luck deserted him, for the ball that he drew out of the bag and handed to Chairman Rene de Knyff bore the starting number fifteen.

Almost at the last minute, Emile Mors came into the A. C. F. clubhouse and handed over \$4,800 in payment of double entrance fees for his three Mors cars. Rochet-Schneider, who was looked upon as an eleventh-hour entrant, failed to come forward with the necessary cash. Total entries for the Grand Prix race thus stand 49, of which 24 are French, 9 German, 6 Italian, 6 English, 3 Belgian and one American. For the voiturette race to be run over the same course the preceding day there are now 65 cars, all of them French with the exception of the Isotta-Fraschini and Martini teams. A Delage car will be the first to start in this event. The number of entries constitutes a record, the total being greater than has ever been gathered together for any speed event, and the Grand Prix cars alone being superior in number to those of any previous big race held in Europe.

Since landing at Havre from the cross Channel steamer from Southampton, the American team for the Grand Prix has not wasted its time. Training quarters having been secured at the Grand Hotel, Dieppe, and close acquaintance was made with the course by means of the touring car. Although geared far too low for the fast French roads, the Thomas Flyer swept over the 47 miles of perfect macadam in so much under the hour that Strang would certainly have difficulty in pleading "Not guilty" to a charge of exceeding the French speed limit.

Various formalities having to be accomplished in Paris, the entire team ran down from the seashore to the capital last Sunday, a French Protos racer, with Emile Stricker at the

wheel, going ahead to show the way, Strang following on the roaring Thomas, and the rest of the team packed, together with their baggage, in the touring car which Knipper took care of.

The Prothos, which claims to have something like 120 horsepower within its six cylinders, set a merry pace that Strang had no difficulty in duplicating. Knipper was shaken off on every stretch of open road, but in the villages, where the racers had to cut down to a noisy crawl on account of the Sunday merrymakers, the touring car with its fluttering American flag was always able to run close up.

French government officials have no cognizance of New York-Paris runs, Brighton Beach twenty-four-hour and other records, and before Montague Roberts could get behind the wheel of a Thomas touring car he had to take an inspector for a five-mile run through Paris. The report of the inspector was that he guessed "Monty" was fit to drive any type of automobile and a first-class permit was issued on the spot.

The cylinder bores of the racer having been verified and stamped and spare cylinders treated in a similar manner, the racing car and full team will return to Dieppe and make such further road tests as are necessary in the neighborhood of the circuit. Racing cars are not allowed on the course, so that most of the driver's training will have to be done with the touring car. It is practically certain that the course will be opened for official trials a few days before the race, but the period is not likely to extend over four or five days, and will be limited to two or three hours each morning. In this respect all foreign cars are at a disadvantage, the club being obliged to close the roads to racers a couple of months before the event in order to allow the bad spots to be remade and the whole surface to be tarred. There are at present portions that have been dug up by anti-skid tires, but all such spots are being entirely relaid and the tarring apparatus will provide 47 miles of highway absolutely dustless. Already the greater portion of this work has been accomplished.

Work on the grandstands and gasoline stations is in an advanced condition. The entire ground at the starting line has been marked out, the big trench running the entire front of the grandstand has been dug out, and the tunnel connecting the outside with the inside of the circuit has already been pierced. The foundations of all the buildings are laid, and everything is so advanced that there should not be any eleventh-hour hustling. In some of the villages stout barricades are already erected; in the open country light fencing is lying in readiness to be put up.

RULES PUBLISHED FOR CIRCUIT DES ARDENNES.

BRUSSELS, June 3.—The sports committee of the Automobile Club of Belgium has issued the rules and regulations for Belgim's two most important races for the season—the Circuit des Ardennes and the touring car race for the Liedekerke cup. Both events are scheduled to be run August 12, the former over a course of 600 kilometers and the latter over the same circuit, but the distance to be only 400 kilometers. For some time it has been said that the old Ardennes circuit would be used, the one including on its route the following towns and villages: Bastogne, starting and finishing place; Longlier, Offaing, Leglise, Anlier, Habay-la-Neuve, Corne du Bois des Pendus, Martelange and Bastogne. A visit at the Automobile Club of Belgium headquarters this afternoon, however, brought out the fact that Baron de Crawhez is in the Ardennes district trying to discover some new roads. There will not be much of an entry list by Belgian manufacturers, owing to the great efforts made for Belgian representation in the Grand Prix next month, but most of them probably will nominate cars for the touring car event.

COUPE DE LA PRESSE POSTPONED TILL 1909.

PARIS, June 10.—Constructors having failed to respond in sufficient numbers to the invitation to take part in a fuel consumption race on the Dieppe circuit next August, the Automobile Club of France has officially announced that its Coupe de la Presse is postponed until 1909. In reality the event is definitely abandoned, for it is doubtful if the competition will be held even in 1909. This abandonment deprives France of the only event for stock touring cars this year, the Coupe de la Presse being designed for stock chassis stripped under certain restrictions, and competing for speed with a limited amount of gasoline. All the interest of the year centers around speed tests, touring competitions in which there are as many winners as classes failing to solicit interest.

Germany intends to be well represented in the Florio Cup race at Bologna, Italy, September 6. The Mercedes, Opel, and Benz have entered teams of three cars each, while it is thought likely other German makers will come in later.

How the Cars Lined Up on Philadelphia's Historic Race Course Ready for the 50-mile Free-for-All.

PHILADELPHIA, June 15.—It was Autocar day at Point Breeze track Saturday, when the Quaker City Motor Club held its annual spring meet. The Ardmore-built car not only captured first place and the cup in the big smoke event—the free-for-all—but took second honors as well, and this despite the fact that its 28-horsepower was pitted against the 40's 50's and even 70's of some of the most powerful American cars on the market. It was a case of heavy driving of moderate-powered cars winning over the tire-punishing rushes of much more powerful machines on a track which turns tricky to a degree and requiring nursing even under such favorable conditions as obtained last Saturday.

Fourteen cars faced Starter Fred Wagner in the big race, and the track was so narrow that two lines were necessary—ten in front and four in the rear. In the awful roar of the exhausts, the crack of the gun was hardly audible, but the cars were sent away to a good start, despite the much-too-close line-up. The first car to show out of the cloud of smoke and dust which followed the contestants around the first turn was the Pullman "40," driven by "Bob" Morton, the hero of last winter's Philadelphia-Savannah race. In the first mile he opened up a gap of 100 yards on the bunch. But the big American "50," with Wally Owen at the wheel, soon came out of the ruck and set sail for the leader. Slowly but surely "Wally" closed up on "Bob," and shortly after the completion of the eighth lap went to the front with a burst of speed which set the crowd wild.

Had Owen been content to maintain a small lead till the close of the race he might have won; but he made the mistake of trying to lap his pursuers, not once, but twice, and again. This brought about his undoing, for after holding the lead for 25 miles, the grinding on the turns put one of his tires to the bad, and on the next lap he ran into the infield for repairs. Morton lost no time in moving to the front; but once there, he made the same mistake as "Wally"—he opened up wide and attempted to put miles of daylight between his Pullman and the oncoming bunch. But the turns got him, too, before long, and on the 29th lap the York-built car went into quarantine with a deflated tire.

Meantime the two Autocar "28's," driven by E. F. Frease and J. F. Brown at a moderate gait—a trifle under 1:20—had made

up a 11-2-mile default and swung into the lead amid a roar from the crowd of 7,000 which hugely enjoyed the performance of the local cars and immediately began to root for a victory. The big Thomas "70" of Charley Howard, which earlier in the day had made the fastest time of the meet, but which had lost time through tire trouble, then challenged the Autocar duo, but the increased speed soon resulted in more work for the medicine men in the infield, and it lost its opportunity.

The only cars that now had a chance against the Autocars—and that only in the event of a breakdown of the latter—were Frank Yerger's stripped Studebaker "30" (the self-same car that was beaten in the duel with Morton's Pullman in that slimy race to Savannah) and the 35-horsepower Mitchell, driven by William Freitag. But neither of the latter had the speed to more than hold the Autocars even, and the latter kept on the even tenor of their way reeling off 1:20 miles. By the time the big fellows swung out again in pursuit their lead was too big to be overcome in the short distance yet to be covered, and the Ardmoreites registered a one-two victory in rather hollow style in the slow time of 1:06:51.

The fastest race of the day was the 10-mile event for stock chassis listed at \$4,001 or over. It was a ding-dong affair between Howard's big Thomas and Wally Owen's American. Each car was in the lead several times, but on the last lap the Thomas went out in front, and lasted to the tape, although the American was beaten out but by the narrow margin of two-fifths of a second—the only nose finish of the day.

Although unsuccessful in the big race, "Bob" Morton scored in both the \$2,001 to \$3,000 stock chassis races—at 5 and 10 miles—beating out a brother Pullmanite, C. B. Kirkham and Jack Harkin's Thomas-Detroit "40" in the short event, and again Kirkham and J. F. Brown's Autocar in the ten mile. One-two twice for the Pullman should have satisfied almost anybody, but Manager "Lee" French, of the local agency, was heartbroken over Morton's bad luck in the big race.

Counting the fact that it made the fastest time in the mile trials, the Pennsylvania "50," driven by Len Zengle, was also a double winner. It beat out A. G. Van Tine's Garford "40" in a

Winning Autocar that Captured the 50-mile Free-for-All.

special five-mile match race and in the trials did a 1:10 mile, beating out the Thomas Flyer, the Garford and the Jackson.

"Pop" Parkin entered his just completed "Big Joe" in the free-for-all, but experienced trouble from the start. He kept pluckily at work, however, and the car was running at the finish gun, although miles behind the winner.

In a special race for Autocars, John Archfield beat out the winning and place cars in the free-for-all, sweeping under the wire in 4:00 flat.

William Freitag's Mitchell "35" easily disposed of the 24-horse-power Maxwell, driven by William David, in the five-mile race for gasoline stock touring cars listed at between \$1,251 and \$2,000. The summary:

ONE MILE—GASOLINE STOCK RUNABOUTS, \$850 OR UNDER.

1. Buick	18	Edward Wilkie	1:34
2. Ford	18	J. F. Graham	1:37 3-5
3. Maxwell	14	W. M. David	1:44 2-5

THREE MILES—GASOLINE STOCK RUNABOUTS, TOUR-ABOUTS, TOURING CARS, TOURING RUNABOUTS, \$851 TO \$1,250.

1. Buick	18	Edward Wilkie	4:24 1-5
2. Mitchell	20	William Freitag	5:01 1-5

FIVE MILES—GASOLINE STOCK CHASSIS, COMPLETED CAR LISTED AT \$2,001 TO \$3,000.

1. Pullman	40	Robert Morton	6:17
2. Pullman	33	C. B. Kirkham	
3. Thomas-Detroit	40	Jack Harkins	

FIVE MILES—GASOLINE STOCK TOURING CARS, \$1,251 TO \$2,000.

1. Mitchell	35	W. Freitag	7:21
2. Maxwell	24	Wm. David	

FIVE MILES—SPECIAL MATCH RACE, STOCK CARS.

1. Pennsylvania	50	Len Zengle	6:27
2. Garford	40	C. A. G. Van Tine	

TEN MILES—GASOLINE STOCK CHASSIS, COMPLETED CAR LISTED AT \$2,001 TO \$3,000.

1. Pullman	40	Robert Morton	12:27 3-5
2. Pullman	33	C. B. Kirkham	
3. Autocar	28	J. F. Brown	

TEN MILES—GASOLINE STOCK CHASSIS, COMPLETED CAR LISTED AT \$4,001 OR OVER.

1. Thomas Flyer	70	Charles Howard	12:00 2-5
2. American	60	Wally Owen	12:00 4-5

FIFTY MILES—FREE-FOR-ALL.

1. Autocar	28	E. H. Frease	1:06:51
2. Autocar	28	J. F. Brown	
3. Studebaker	30	F. H. Yerger	
4. American	50	Wally Owen	
5. Mitchell	35	Wm. Freitag	

TIME TRIALS—ONE MILE.

1. Pennsylvania	60	Len Zengle	1:10
2. Thomas Flyer	70	Charles Howard	1:16
3. Garford	40	A. G. Van Tine	1:18
4. Jackson	30	J. Robinson	1:27

THREE MILES—SPECIAL FOR AUTOCARS ONLY.

1. Autocar	28	John Archfield	4:00
2. Autocar	28	J. F. Brown	
3. Autocar	28	E. H. Frease	

CHICAGO MOTOR CLUB'S 1,000-MILE TEST.

CHICAGO, June 15.—Final surveys of the four routes that will be used in the Chicago Motor Club's 1,000-mile reliability run June 24-27, show that the contesting cars will be required to travel 1,014.2 miles, divided, into daily trips of 267.7, 243.9, 258.1 and 229.5 miles. In making these trips the cars will pass through a territory which is regarded as a fruitful selling field, it being peopled by rich farmers who are becoming interested in motor cars. The roads are reported to be above the ordinary, except, of course, there are a few bad stretches which will test out the cars.

First day, June 24.—The cars will be sent on a trip to the north into Wisconsin, going through Highland Park, Lake Forest, North Chicago, Waukegan, Zion City, Kenosha, Lake Geneva, Delavan, Emerald Grove, Janesville, Wis., Beloit, Rockford, Ill., Rochelle, De Kalb, St. Charles, West Chicago, Lombard, Elmhurst and back to Chicago. The total distance for this leg of the run is 262.7 miles, with checking stations at Kenosha, Janesville and Rochelle. This route was mapped out by O. G. Temme and T. T. Roe in a White steamer.

Second day, June 25.—The cars go west, hitting Elmhurst, Lombard, Glen Ellyn, Naperville, Aurora, Big Rock, Little Rock, Somonauk, Wedron, Ottawa, Lowell, Tonica, La Salle, Earlville, Leland, Somonauk again, Sandwich, Yorkville, Aurora, Downers Grove and Lyons, the mileage being 243.9, according to the odometer reading of the Dorris, driven by Charles P. Root. The checking stations will be at Aurora, La Salle, Ottawa and a second time at Aurora.

Third day, June 26.—Cars will follow the route marked by Harry P. Branstetter in a Wayne roadster, a journey of 258.1 miles in length, which goes into Indiana by way of the Halsted street route, touching Riverdale, Oak Glen, Munster, St. Johns, Crown Point, Merrillville, Valparaiso, La Porte, Tea Garden, La Paz, Plymouth, Lakeville, South Bend, New Carlisle, Rolling Prairie, Michigan City, Burdick, Chesterton, Porter, Hobart, Highands, Hammond and South Chicago. The checking stations will be at La Porte, Plymouth, South Bend and Michigan City.

Fourth day, June 27.—The scene shifts again to the west, following a trail brazed by C. A. Tilt and F. H. Trego in a Diamond T roadster, the distance being 229.5 miles, and passing through Addison, Bloomingdale, Ontarioville, Elgin, Huntley, Marengo, Belvidere, Cherry Valley, Rockford, Byron, Oregon, Honey Creek, Chano, Kings, Rochelle, Steward, Shabbona, Waterman, Hinkley, Big Rock, Aurora, Downers Grove and Lyons. The checking stations will be at Elgin, Rockford, Rochelle and Aurora.

A MILLIONAIRE MEET AT LONG BRANCH.

Prominent Long Branch summer residents, whose names for the most part are conspicuous in the motor car fraternity, have formed the Elkwood Park Automobile Association, and will run a race meet at the old mile circuit, whereon in earlier days of the sport similar contests were held on Fourth of July.

The officers of the new association are: President, Hon. Charles C. McFadden, Mayor of Long Branch; vice-president, Robert Guggenheim; treasurer, William B. Anderson; secretary, T. Francis Moore; governors, Fred Lewisohn, Harry Payne Whitney, W. E. D. Stokes, P. J. Casey, Walter Lewisohn, Martin H. Vogel, and Col. T. J. O'Donahue.

The program is as follows: 100 miles for Guggenheim \$250 trophy; 50 miles free-for-all for Lewisohn \$200 cup; 10 miles for amateurs under A. A. A. rules; 5 miles pick-up race for fully equipped touring cars to stop and pick up a passenger each mile; time trials against circular track records.

Morton in Pullman Winning Five-mile Stock Car Class.

CHADWICK SCORES AGAIN AT CLEVELAND CLIMB

CLEVELAND, June 15.—Following its victories at other important events of the kind, the Chadwick has invaded the home city of what are reputed to be the fastest hill-climbing cars in the world, the White and the Stearns, and carried off the honors in the Cleveland Automobile Club's annual hill-climb, but through an unfortunate combination of circumstances there was practically no competition for the winner in its own class, Walter White still being in the hospital and the Stearns interests not entering any of their cars, in conformity with their policy of only being represented by amateur-owned machines. However, the Stoddard-Dayton, of far less power, proved itself a formidable rival to the big six-cylinder champion and pushed the latter's times very closely. In fact, the smaller car's performance, and the driving of Mrs. Kenneth R. Otis in the event for the amateur championship of Cuyahoga county, in her four-cylinder Stearns roadster, were the features of the day.

Alone in the car, she handled the wheel like a veteran of many racing mcets and the speed at which she sent the racy-looking car up the incline brought forth a cheer from the crowd, while the announcement of her time of 54 3-5 seconds was responsible

finishing in the order named. In this event the winning car is determined by figuring the piston displacement, weight of car, gear ratio, percentage of grade and the speed attained. The driver must use the same gear all the way, for changing means disqualification.

Porter hill, on which the climb was held, is an excellent place for such an event, and it is more than probable that the climb will be held there again next year. The cars get a flying start of about 200 feet before they strike the tape—then 200 more of level ground, followed by a more than a quarter of a mile of stiff incline averaging more than 16 per cent. At the end there is 500 feet of very slight grade, allowing an excellent finish.

Considering the steepness of the incline, the time by the Chadwick in the trial against time after the scheduled events—36 seconds—is nothing short of wonderful. In the free-for-all the car made it in 42 4-5 seconds, and sanction was then granted for another trial by the committee. Like a skyrocket the flying car appeared as it shot up the incline, bounding over the rough surface of the ground. The road was perfectly straight, and from the finish line one could watch the machine as it flashed up the

Haupt and His Fast-flying Victorious Chadwick.

Mrs. Otis and Her Prize-winning Stearns Roadster.

for the popular ovation which greeted her as she returned down the hill after making the record climb. The trophy offered in this event was a solid silver cup donated by the Warner Instrument Company, and must be won three times in succession before passing permanently to the victor. The name of Mrs. Otis will be the first to go on it, and she has signified her intention of competing for it again next year.

Taken all in all, the work of the Stoddard-Dayton was the most remarkably consistent performance of the entire program, for, competing with cars of its own classification in every event, it took three firsts and a second, and in every case bettered the times of its nearest competitors by several seconds. Cleveland has never seen a better electric event, the Columbus and Baker machines carrying off the honors. In the first event—that for electrics selling under \$2,000—the Columbus took first place in 1 minute, 15 seconds, winning over the Baker and Babcock machines, while in the event for electrics selling over \$2,000 the Baker roadster, running alone, made the climb in 1:7 flat.

Another feature event was the piston displacement handicap for all makes of gasoline cars, irrespective of power or number of cylinders. In this a single cylinder stands as good a chance as any four or six, for the winning car is determined by finding what percentage of efficiency is developed. In this event the Knox won, showing 77.5 per cent.—a very excellent performance, according to the Technical committee. The Pierce Arrow came in second with 70.7 per cent., the Stoddard-Dayton and Corbin

hill. Haupt's driving was remarkable, and veteran racing men who were on the scene could not help but marvel at it.

Just before the climb, what the crowd took to be two novel competitors appeared on the scene, and there was almost a small riot, due to the curiosity of the spectators to see the machines. They were two of the farmer's buggy autos that the International Harvester Company is building at its Akron factory and were driven over from there by the testers to see the climb. To say that their appearance created a sensation is to put it mildly.

The complete summaries follow:

TO HOLD ANOTHER "DEAD HORSE" CLIMB.

WORCESTER, Mass., June 15.—J. P. Coughlin, president of the Worcester Automobile Club, announces that the club will conduct still another automobile climb on Dead Horse hill this year, the next time in October, because the one on June 6 was so great a financial success; because he believes he can bring more racing cars and noted drivers here, including Vanderbilt Cup race entrants; because he believes he can secure many entries of 1909 stock cars, and because coming at so late a date it will come near being the winding up of the season.

International Harvester Buggy Autos at Cleveland Climb.

MOTORCYCLISTS' NATIONAL MEET PROGRAM.

The program of the sixth annual meet of the Federation of American Motorcyclists, which will take place in New York, July 1 to 4, has been determined upon. It fairly bristles with pleasurable activities and is as follows:

Wednesday, July 1—8 a.m.—Runs to Grant's Tomb, Lafayette Boulevard and Fort George Hill; 12 m.—Sightseeing tour in "rubberneck" coaches; for out-of-town visitors only; 2 p.m.—Run around Central Park; 4 p.m.—Run to Hall of Fame and Van Cortlandt Park; 8 p.m.—Excursion to Coney Island.

Thursday, July 2—8 a.m.—Bath run to Coney Island, via cycle paths; or bath and exhibition of life-saving at Dalton's Battery Baths, New York City; 11 a.m.—Run to Roslyn, via Jericho road; 3 p.m.—Tilting tournament at Roslyn; 8 p.m.—"Smokefest" and high old time at Roslyn.

Friday, July 3—7 a.m.—Start of 50 miles economy contest from Roslyn; 1 p.m.—Chowder party and annual photograph at Sea Cliff, L. I.; 7:30 p.m.—F. A. M. annual business meeting and election in Terrace Garden Hall, New York City.

Saturday, July 4—10:30 a.m.—Trolley excursion to Paterson, N. J.; 2 p.m.—National championship race meet on Paterson Stadium.

The annual F. A. M. national endurance and reliability contest will serve as a curtain raiser on June 29 and 30. The first day's run will start at Catskill, N. Y., and terminate in New York City, a distance of 174 miles. The second day's run will be from New York to Riverhead, L. I., and return, 176 miles, making a total of 350 miles.

"AROUND THE WORLD", IN AUTOMOBILES.

MONTCLAIR, N. J., June 13.—An automobile tour of the world was promoted here to-day with great success for the joint benefit of three local charities. A grand central station was established, from which trips were made to various cities, personified by various residences appropriately equipped for the day as to the costumes of the ladies in waiting and decorations.

From the grand central station the travelers were conveyed to Peking, the residence of William B. Dickson, on Llewellyn Road; Madrid, the residence of Albert French, on Upper Mountain avenue; Yokohama, the residence of William G. Frost, on Upper Mountain Avenue; Berlin, the residence of H. F. Holloway, Upper Mountain avenue, and Constantinople, residence of W. B. Millar, Park street. At Yokohama the guest of honor was Kokokichi Midzuno, the Japanese Consul-General at New York, and his wife and two children. At the city of Peking there were a large number of native Chinese, picturesquely attired, and at the other cities the scene was effective by reason of the gay costumes and picturesque decorations.

TO OPEN WEMME CUP RACE TO THE WORLD.

PORTLAND, ORE., June 12.—It is now proposed to throw next year's race for the Wemme cup open to the world and make it an event that shall attract the cars not only of every section of this country but also of every automobile building nation. The fact that Portland can offer military protection and a course, over which local stock cars averaged better than Briarcliff and equaled Savannah times, is deemed a reasonable basis for the promotion next time of a more ambitious race. The contest of May 30 was confined strictly to cars nominated by local dealers. The next contest will be in every sense of the word a free-for-all. Its promoters plan to make of it a Pacific coast classic and even cherish the hope that the prospect that the Vanderbilt Cup race may be run over what many have pronounced the finest national automobile race course in the world is not impossible.

LOWELL'S FOURTH OF JULY RACE DOUBTFUL.

BOSTON, June 15.—The possibility of holding the proposed 250-mile race on the Merrimac valley course near the city of Lowell grows more doubtful as the Fourth of July, the date for the event, draws nearer. The Lowell Automobile Club has been refused the use of the State militia to guard the course and it is also up against the possibility of not being able to secure a permit to close the roads.

WHENEVER the hue and cry are raised against a thing, it is inevitable that the verdict of the unthinking mass will be "guilty," for those who follow a "blind lead" can see nothing else. Hence, only one side of a question is presented to view, and that in a most biased way. *Prima facie*, a good case can be made out for any cause, no matter how hopeless, provided its advocate be gifted with the necessary talent, and it is only when the defense is heard that the true state of affairs is brought to light. This is the case of the *Horse vs. the Automobile* in a nutshell, where the matter of road damage is concerned, though it is a case that is presented for public consideration solely as *The Automobile vs. the Road*, in the vast majority of instances, and the horse is not cited in any connection. Barrels of ink and miles of white paper have been consumed in raising the hue and cry against the automobile, on the score that it is a destroyer of the road, pure and simple. "Tax it to build new roads and keep the old ones in repair," cry the politicians and their constituents. Then tax it some more.

It would be foolish to attempt to assert that the automobile does no damage whatever to the roads; quite as foolish as it is to utterly ignore the pounding of steel-shod hoofs and the drawing of heavy loads on narrow steel tires, as factors in the process of wearing out a road. If any course of reasoning be indulged in on the matter, it is doubtless the somewhat fallacious one that the holes dug by caulks and sharpened shoes, and the deep ruts caused by absurdly narrow tires for the weight carried constitute *legitimate wear and tear*, while that for which the automobile is responsible is *destruction*. This appears to be the commonly accepted view, and because the damage that the automobile does is far more in evidence owing to its novelty and the fact that it is emphasized on curves, the toll that the horse and his burden take from the stone-shod surface are lost to sight entirely. Let it be granted without a quibble that the automobile does do more or less damage to the road, both for the sake of argument and because it is actually a fact. To admit half the contentions of its detractors, however, would be to damn it forever, and if even 50 per cent. of these accusations were founded upon fact, it would be necessary to rebuild every much-traveled automobile road at least once in two years.

Considering the Question Impartially.

But if the matter be taken up and considered point by point in a logical and reasonable fashion, rather than in the senseless and prejudiced manner that has characterized the majority of accusations against the automobile up to the present, it will be evident long before all the testimony is in that an exceedingly strong case can be made out against the horse, and even the most biased observer will be forced to admit that the horse has hardly a leg to stand on when it comes to putting in an adequate defense to the various charges that can be brought against him on the score of road damage. The point that appears to be en-

tirely lost sight of by the majority of those who are wont to accuse the automobile of tearing up roads by the roots is that a road, like everything else, is bound to wear out in time. From this the question arises, "Which wears it most?" When a study has been made of the nature of the damage caused by the horse and its load, it will be quite evident that, proportionate to his speed, the horse is more destructive of road surfaces than the auto.

About Steel or Rubber Versus Stone.

That this must be apparent to even the untechnical observer, when the character of the wear which is imposed on the surface of the road by the two different forms of locomotion is taken into consideration, calls for no argument. In one case there is the pounding of steel-shod hoofs, impelled by a force amounting to many hundreds of foot-pounds per minute, as the average horse weighs in the neighborhood of three-quarters of a ton, and lifts his hoofs several inches from the ground, while, on the other, there is the smooth rolling of soft rubber. This is aptly illustrated by the sketch showing the action of the hind leg and hoof of a horse as compared with the rolling action of the wheel of an automobile.

It goes without saying that a rubber tool would never be selected to work stone with, yet the automobile tire has actually been accused of breaking the stone of the roadway, and in support of this it is pointed out that steel studs and rivets are employed on the treads and it is the presence of the harder material in this form that does the damage. This, of course, does not take into account the fact that these steel projections are backed by rubber or leather, and that when a blow is received by a complex structure, such as the canvas-rubber-leather-steel combination of the automobile tire, the softest materials will naturally yield first. The steel studs may be harder than the stone of the road, but they do not strike it a blow, merely exerting a constant rolling pressure, a smooth surface being assumed. When a slight obstruction is met, something must give, and that something is the tire, which, to a certain extent, "absorbs the obstacle," the steel rivets receding as their backing is compelled to give way, instead of being impelled forcibly against the stone by a blow. Take any "single track" roadway and note the very distinct trough that the horse has carved out for himself in the center of the road, and which he is so loath to abandon that unless actually kept to one side by constant attention on the part of the driver, he will automatically resume his plodding in the softer track that he has carved out for himself.

"Do Not Drive in the Ruts."

Not long ago this was a very familiar sign along improved roads in rural districts, and it constituted the chief expression that the desire for good roads assumed among many agricultural communities. It serves to bring to light the fact that the horse-drawn vehicle is really responsible for as much, if not more,

Methods of Road Destruction Graphically Compared.

It requires no abstruse mathematical calculations to demonstrate that three-quarters of a ton, resting on four steel-shod points of comparatively small area, and which are alternately lifted and brought down in pairs, will do much more to disrupt a surface than the rolling action of four wheels, even where the tires are shod with steel rivets.

damage to the road surface than is the animal itself. Gauged by the foot rule, the central path gouged out by the four steel-shod hoofs approximately equals the sum of those made by the narrow steel-tired wheels, though the necessity of "turning out" tends to widen the wheel ruts more than it does the horse's path. The damage occasioned by the tire is much worse in reality, as the ruts are invariably deeper throughout their length than is the case with the series of holes that constitute the central strip that is pounded out between the track of the wagon. The illustration showing the section of a road carrying a wagon and its motive power shows in a striking manner exactly the nature of the damage occasioned by the horse and its load. Nor have they been exaggerated in the least, as it would be quite possible to select examples that could not be exaggerated, so bad are they in their natural state. Residents of New York will recall the frightful state that upper Seventh avenue, extending north from Central Park, was continually in between 1890 and 1900. During the decade intervening between those years it was found necessary to relay an entirely new macadam pavement from foundation up, on an average of once every three years, while between the total renewals of the pavement there were frequent occasions for repairs calling for the employment of tons of crushed rock and fine gravel for the top dressing, all of which was applied in the most approved manner and thoroughly wet down and rolled before traffic was allowed upon it. But, with the exception of the short periods following upon the conclusion of such operations, the avenue, which has long been one of the city's chief driveways, was a disgrace to the municipality. During the years in question there were not enough automobiles on Seventh avenue to do more than arouse the curiosity of those who saw them, and no one ever thought of accusing the power-driven vehicle of being the cause of the numerous deep ruts and wallows that extended to each curb.

Rain Is the Chief Cause of Damage.

After all, it is the rain that actually does most of the damage, but it is the work of the horse and its load that opens up the

Nature of the Damage That Narrow Tires Do.

This sketch depicts a cross-sectional elevation of a road and serves to illustrate the nature of the damage done by both the horse and its load. A common dirt road has been selected for the purpose of the illustration, owing to the far greater depth of the ruts usually encountered. The damage done by the horse's hoofs is proportionately greater than would appear from the sketch, as owing to the dirt lying in the hollows, it does not show as plainly.

opportunity for the falling water and the stagnant pools left behind to do their work, by sinking into and disintegrating the whole road structure. Steel hoofs and narrow steel tires loosen and scatter the top dressing and the water comes to wash it away, and in a very short time channels are formed in which the water runs one way or another, according to the gradient of the road. A continuation of the grinding process of the steel against the bottom of the ruts loosens more material and more is washed away, which serves to explain the rapid manner in which the ruts are deepened, so that in time they open communication with the foundation beneath, and then the rain has an opportunity to undermine the entire structure.

Long before anyone ever thought of such a thing as an automobile ruining the roads men who knew what they were talking about, preached the doctrine of wide tires, and many attempts were made to pass legislation providing for the compulsory adoption of tires of a width calculated to bear the load the wagon was designed to carry. But most of these attempts were good efforts wasted, the legislation could not be passed, in the majority of instances, and the wagon user could not be brought to see that the innovation was entirely for his own benefit, in that a very much heavier load can be drawn over the same road

Result of Hoof-pounding on Park Macadam.

The difficulty of attempting to illustrate such damage by means of photographs will be apparent from this picture, as the hole itself varied from one to three inches deep, though all appears to be practically one level. The depth of the part in the background may be gauged to a certain extent by noting the shadow of the shoe cast downward in the hole.

with the same power where a wide tire is used, and the tire acts as a road maker, rather than a road destroyer.

As a matter of fact, there has been more blind prejudice to contend against where it has been a question of spending money for road improvement than has been the case where almost any other public improvement that could be mentioned has been at issue. And it is this feeling, heightened by the belief that the automobile is purely a rich man's plaything, that has been extended against the power-driven vehicle where its effect on the roads is concerned. Few have ever stopped to analyze the character of the damage caused by an automobile, nor, for that matter, have they ever stopped to give either side of the question a thought; they have simply joined in the hue and cry because it seemed to be the popular thing to do to decry the automobile and all its works.

More Counts in the Indictment.

A little study of the question serves to show that, whether walking, running or standing, the horse and its load never tend to improve the surface of the highway, but the wear is constant under any of these conditions, and not a few of the worst holes in the road surface are made by the horse, at the expense of his feelings while he is standing still, for it is then that he is under the greatest necessity of pounding, to relieve himself of the flies. The most rabid can scarcely urge any argument against the auto as a road destroyer while it is standing against the

Water Shows Up Road Damage in Its True Light.

Many macadam roads appear to be in excellent condition when viewed in a perfectly dry state, but a few pails of water thrown on the surface immediately brings out the ruts and depressions and strikingly reveals their depth.

curb. Here, at least, even those who are totally blind to hoof-marked holes and deep but narrow ruts, of which the automobile could not by any stretch of the most perfervid imagination be put down as the author of, must concede that the automobile is absolutely harmless.

Again, take the case of the automobile as it starts off, and as it is running at its average normal speed of 15 to 25 miles an hour, and the man who does not let his prejudice carry him away must admit that the automobile, with its broad rubber tires, not only does no damage to the road, but is actually a *road improver*. To those who regard this as a claim which goes beyond the legitimate, it is easy to make the following test, which cannot fail to convince the most skeptical. There are so many evidences of horse and wagon damage on the surface of any well-traveled road that the passage of any individual outfit leaves no perceptible trace, so completely does its imprint blend and become confused with the many that have preceded it. But if a stretch of a hundred yards or so be selected, and covered with a one or two-inch layer of fresh sand or earth, a fresh page will have been created upon which some striking records can be made.

Letting the Horse Incriminate Himself.

Have a horse and buggy, a delivery wagon or any of the other standard types of horse-drawn vehicles in daily use, driven over this stretch at a walk or trot, it does not matter much which, as the damage will not vary much in either case. The result will be a series of clean-cut depressions marking the passage of the wagon wheels by ruts which reach through to the hard surface beneath, and of holes which do likewise wherever the horses'

Enlarged View of a Narrow Rut in a Stone Road.

Apparently this rut is very wide and shallow, but in reality it was scarcely more than two inches wide at the bottom, showing unmistakably the work of the narrow iron tire, as it was not wide enough for an auto tire to "bottom" in.

hoofs have been planted. By driving the outfit first in one direction and then returning in the opposite direction over the same stretch, it will be at once apparent how greatly the latter operation increases the damage, as the horses' hoof-prints just overlap in such a manner that the holes originally made are approximately doubled in size.

To realize the extent of the damage thus created, for the marks in the soft surface prepared in this manner are merely duplications on a larger scale of what occurs to every road when a horse-drawn load passes over it, natural conditions must be copied still further. After the horses and wagon have passed over the prepared stretch once in each direction, a garden hose with a sprinkler attachment on it should be turned on the road, to simulate rain. A few minutes' wetting will cause every one of the depressions to fill up with water and it will be noted that the streams which form in the ruts thus created tend to carry off the top dressing of the road with them. In slightly magnified form, for purposes of demonstration, this is nothing more or less than what is constantly taking place on every road, and it is damage for which nothing but the horse and its load are purely responsible.

Repeat the Experiments with the Auto.

To provide the most striking contrast possible of the effect of the passage of a horse and wagon and of an automobile, have the prepared stretch returned to its original condition by raking out all evidences of the former's passage. Then have the automobile make its mark in the same unmistakable manner in which the horse has been compelled to accuse himself. But not at the

Striking Illustration of Damage Done by Horses and Narrow Tires on a New York Driveway.

Narrow Ruts, Three Inches Deep, in Macadam.

To better bring out the depth of these narrow ruts, twigs have been placed across them, but even this expedient fails to show them up in their true state by the aid of the camera, which does not lend itself well to this purpose.

gingerly pace of which he is capable; let the car be driven over the loose sand or earth at a speed of 20 to 25 miles an hour—five times faster than the average horse covers the ground, and note the result. In place of a series of holes and ruts two inches deep by two inches wide, assuming the loose dressing to be two inches of sand, there are a pair of broad, flat ribbons in which the material has been *compressed*, instead of being piled up at the sides of lines marked by the passage of the wheels. In other words, the automobile *does not create a rut*, but where there are narrow ruts it tends to fill them and flatten them out, thus acting as a road improver. This may be demonstrated by running the automobile over the prepared stretch before the marks of the horse's damage have been wiped out, and it will be found that the newly created ruts have been practically obliterated. But, to return to the tests as originally planned, it will be found that by driving the automobile backward and forward over the prepared stretch at speeds not exceeding 30 miles an hour, that the effect is really to *improve* the surface, the sand or earth being flattened out and compressed much the same as it is when a steam roller is run over it, except on a smaller scale. Applying the water test, as previously described, does not bring to light any such opportunity for the rain to wash away the surface dressing of the road, as is the case where a horse and wagon have passed over, as there are neither holes nor deep, narrow ruts in evidence, consequently there are no rivulets to wash their banks away in progressing downward, in accordance with the speed given them by the degree of the grade, nor any depressions to create puddles which seep through and undermine foundations. Few more conclusive or more convincing tests could be made than this.

Damage That the Automobile Does.

How is it, then, may well be asked, that the automobile is accused of doing such a great deal of damage, even by men who are not wholly given to exaggerating things, nor are wholly

Showing Central and Side Ruts in a Road.

As well as a photograph can do it, this shows the typical form of damage illustrated by the previous cross-sectional sketch, with the exception that this is a macadam and not a dirt road.

prejudiced against it? As already made note of, it would be childish to go on record as stating that the automobile is wholly free from guilt in the matter of wearing out the roads. It does its share, but that share is far less than that of the horse under any circumstances. By employing tires shod with non-skid bands, chains or similar traction-giving devices, in the foregoing experiments it would be found that the impressions left would not be so smooth; instead of the plain compressed strip there would be the marks of the projections adorning the tires, and the continued passage of such tires over the same strip would not compress it as effectively as where smooth tires were used; but even at speeds up to 25 or 30 miles an hour the effect could not be compared for a moment with that occasioned by the passage of the horse and wagon.

By increasing the speed of the car to 40 miles an hour and over, it would become apparent that the rapid passage of the rubber over the surface created a certain amount of suction that caused some of the finer particles of the dressing to be lifted bodily and these will be seen following the wheel for a few inches as it rolls along. In a lesser degree, the same thing happens when an automobile is driven over a macadam road, but it is necessary to run the car at speeds of from 40 to 60 miles an hour in order to make the effect apparent. Examination of a road surface that has been treated in this manner shows it to have a bare appearance, the finer pebbles and filling material having been removed as if with a broom. But in no case is the surface broken into or cut through in the manner invariably caused by horse traffic, as revealed by narrow ruts and hoof holes that cover a very large part of the surface.

Auto Damage May Be Readily Prevented.

The crucial test of the horse's vastly greater powers of road damage is to be found in the fact that this sweeping of the fine material out of the interstices of the top dressing of stone by the automobile when running at high speeds does not occur where any binding material, such as tar and oil, has been employed, but horse hoofs and narrow steel tires cut through a road surface regardless of the nature of its construction. As compared with this, the greatest damage occasioned by the automobile is to be attributed to the practice of taking curves at high speeds. Holes and ruts are no worse on curves than straight stretches, merely because a horse and wagon do not travel around a curve at any speed, but the automobile does, and because of the lack of banking necessary to permit this without damage the car slides laterally in making the curve, and tends to pile up the loose material thus created, at the outer edge.

It is unfortunate that there have not been more numerous opportunities of actually comparing the damage done by horses and wagons and by automobiles on roads of similar nature, but, so far as known, the only case where this has been possible has been on the *Champs-Élysées*, Paris. This is a broad avenue divided into three roadways, the central one of which is exclusively for automobiles, while the outer ones are for horse traffic. The experience of a year has shown that a very much higher rate of speed is maintained in the automobile section, yet accidents have been much rarer than on the horse drives. Where the state of the wood pavement itself is concerned, the only result of a year's use by the automobile has been a gradual change in color from the original brown to a black, caused by the oil and gases, while the horse drives *have sunk irregularly and have become pitted in thousands of places all over their entire surface*, as the result of the pounding of steel-shod hoofs. The pavement in question was newly laid at the opening of the year covered by the record in question, so that it would not be possible to have had better conditions to make a comparative test, as from the time it was first put down until it was examined at the end of the twelvemonth, no horses were allowed on the automobile driveway in the center, and cars were absolutely forbidden the side drives. To-day, the central drive is in far better condition than it was at the outset, as it has been compacted and compressed all over, while the horse drives are ready for expensive repairs.

SOCIETY OF AUTOMOBILE ENGINEERS TO MEET AT DETROIT

WHAT is generally conceded to be the center of automobile manufacture in the United States has been selected as the city for the Third Annual Summer meeting of the Society of Automobile Engineers, namely, Detroit. The summer meeting this year is to be held at the same time as that of the American Society of Mechanical Engineers, both organizations making their headquarters at the Hotel Cadillac, and there will be a mutual exchange of courtesies between the two societies. As a matter of fact, not a few of the visiting engineers are identified with both. The meeting of the A. S. M. E. will open Tuesday, June 23, while the automobile engineers will not convene until Thursday of the same week, the meeting lasting three days.

The Detroit entertainment committee, of which H. E. Coffin, of the E. R. Thomas Detroit Company, is chairman, assisted by Henry Ford, Russell Huff, James H. Herron and Alanson P. Brush, has prepared an attractive program to enliven the stay of the engineers. Thursday morning both organizations will go aboard a special steamer and will be carried up the river to witness the launching of a 10,000-ton lake freighter. In the afternoon one of the local plants will be visited and inspected, and in the evening papers will be read on "Autogenous Welding and Its Application to Automobile Construction," by E. S. Foljambe, and "The Storage Battery in Automobile Work," by Bruce Ford, the former being accompanied by demonstrations of the various processes employed in welding and cutting metals with the aid of the oxy-acetylene burner. Marvelous results are obtainable with this process, and it is expected that the presentation of this paper will bring out a very interesting discussion. Mr. Ford is an authority on the storage battery and the discussion of his paper is also expected to bring out numerous points of interest.

During the morning of the next day—Friday—the automobile engineers will participate in the discussion of the paper by Henry Souther on "Clutches," which was presented before the American Society of Mechanical Engineers at its New York headquarters, May 12 last, and which has already been published in full in THE AUTOMOBILE. During Friday afternoon, the S. A. E. members will participate in a river excursion at the invitation of the mechanical engineers. The steamer *Britannia* will leave the Detroit, Belle Isle and Windsor ferry dock at the foot of Woodward avenue at 3 p.m., sail round Belle Isle, thence down the river to Amherstburg and to the head of Lake Erie, returning to Bois Blanc island, where supper will be served, returning to Detroit later in the evening.

"Some Recent Developments in Magneto Ignition," by Otto Heins, is the paper scheduled to be read Friday evening, and in connection therewith Mr. Heins will show a large number of lantern slides, illustrating the development of ignition during the past 20 years or more. Saturday morning will be devoted to a visit of inspection to one of Detroit's chief industrial show places—the plant of the Packard Motor Car Company—after which the members will be taken to the Detroit Boat Club, where lunch will be served at the invitation of J. G. Rumney, of the Detroit Steel Products Company. Following this there will be an automobile run through Belle Isle Park and environs, of which Detroit is justly proud. In the evening, papers by Frank Beemer, on "The Unit System of Power Transmission in Automobiles," and by A. L. Dixon, on the "Increased Efficiency of Single Motor Drive," will be read and discussed. It is anticipated that Cleveland will be suggested as the place for the fall meeting, to be held in September or October.

INCREASING THE POWER BY CONCENTRATING THE CHARGE

By J. H. K. McCOLLUM.

TO be able to increase the output of a gasoline motor by 110 per cent., without paying more for the improvement in capacity of the motor than the latter is worth must be conceded as something worthy of more than passing mention. But this has been done with the aid of an attachment of which the writer is one of the patentees, and it is the purpose here to describe it and show its workings. First, as to the latter and the manner in which the results were obtained. In our laboratory in Toronto, we have a standard Fairbanks-Morse four-cycle gasoline engine, equipped with this attachment. We have tested this engine on the brake in every possible way (varying the tension of the inlet valve spring and the valve opening, varying the time of the spark, etc., etc.), and noted carefully the power developed by the engine in its original form.

Now, from exhaustive tests, with our attachment in use, we find that we have obtained as high as 110 per cent. more power at the same speed, using extra gasoline or gas in almost exact proportion to the extra power obtained. The attachment was applied as follows:

A hole was bored through the side of the cylinder through the water jacket and cylinder walls at a point where the hole would be just uncovered by the top of the piston when the latter was at the lowest point of its downward stroke. The engine is an upright. We tapped this hole with a tapered tap and screwed into it a tapered nipple cut in the lathe, and to this nipple fastened a valve casing and poppet valve operated from the secondary shaft, the valve in this case opening away from the engine, being timed to open during the suction stroke only and close during the compression stroke only, remaining closed during the remainder of the cycle. A pipe connecting this valve casing to the outlet valve chamber of a small compressor is

used. The compressor is fitted with automatic valves and is run from the main shaft of the engine. It is better to use a separate carbureter for the compressor.

With this system the engine is allowed to draw in the full ordinary charge of mixture as usual, but when this ordinary charge is all in we force in another charge of mixture which is added to the ordinary charge, and thus we have a pressure of mixture in the cylinder above the pressure of the atmosphere before the piston commences to rise on the compression stroke.

The whole secret of the success of this system is in the conjunctive action of this two-to-one valve and the piston of the engine. This valve is driven by an easy, slow action, noiseless cam and a fairly large roller, and, although the valve opens about when the first half of the suction stroke is completed, or when the piston is only about half way down on its suction stroke, the extra charge does not go into the cylinder until the top of the piston uncovers the said hole or port bored through the side of the cylinder, but the moment the piston commences to rise its edge covers and closes the port and entraps the ordinary and extra charges combined, and when the piston has finished about half of the compression stroke the two-to-one valve closes and remains closed until the next suction stroke is about half completed.

In a four-cylinder, 4-inch by 6-inch engine a fifth crank is used, driving a double-acting compressor, having a 5-inch bore and 6-inch stroke. This compressor cylinder is very little higher than the engine cylinder, on account of the narrowness of its piston, and of about the same outer diameter. With a combination of this kind, the power of the engine is practically doubled.

The best arrangement is to have a throttle valve between the compressor inlet valves and its carbureter, and allow the com-

pressor to run all the time, although, if desired, the compressor can be gear and clutch-driven, so that when not in use the engine can be run without running the compressor. When not using the extra or forced charge, the throttle valve is closed and the compressor piston acts similarly to the vacuum dash pot of a Corliss engine, the only extra work the engine has to do being to overcome the friction of the compressor, and we find this so small, especially where four or more cylinders are used, as to be practically negligible.

When the compressor throttle is closed and the engine running only on the ordinary charge, the compression is about 50 or 60 pounds, this giving an easy running, long life engine, but when the compressor throttle is opened and the extra charge added to the ordinary charge, the compression can be put up to any pressure desired, according to the bore and stroke of the compressor, and the amount of opening of the compressor throttle, until the point of preignition is reached, it even being

possible, where an even speed can be obtained, to run the engine with the charge being thus fired by its own compression.

The power obtained by this higher compression, and, consequently, higher explosion pressure, from the use of the extra charge, we find, by actual demonstration and careful tests, to be a different matter entirely from the power obtained by raising the compression of the ordinary charge without the extra charge by a diminished or decreased clearance. This system also allows of the engine running half power on a wide-open throttle, thus giving greater efficiency. With the ordinary engine in automobile, motor boat and other uses at all times except when running developing full power, the engine is running with the compression below the maximum that can be obtained, as is well known, so an engine working under our system will evidently have a greater advantage in higher compressions at lower powers and will only use an amount of fuel proportionate to the actual power output.

SOME VARIATIONS IN TIMING SHOWN BY FOREIGN MOTORS

By C. F. REDDEN, OF THE STUDEBAKER BROS. COMPANY OF NEW YORK.

THERE has been recently published a table which gives the valve timing on many of the best known foreign cars, and it is interesting to note the variations in timing used by several of the more prominent foreign manufacturers. At the first glance it might appear that the valves of an internal combustion motor should open at dead centers for the induction and exhaust strokes, and should remain entirely closed during the compression and power stroke. This, however, is not the case, owing partly to the inertia of gases at high speeds, and also partly to the time taken for the complete combustion of even a perfect mixture; the advance of exhaust opening variations from 30 degrees, which is a minimum, to 58 degrees which is a maximum.

The consensus of opinion among foreign manufacturers, is to close the exhaust valve exactly on dead center. Some few manufacturers let the closing of the exhaust lag 5, 10, and even in some cases 28 degrees. The object of this exhaust valve timing is to rid the cylinders as completely as possible from the product of combustion by opening the exhaust valve about 40 degrees early, and holding it over about 10 degrees late. The inlet valve opens anywhere from 1 to 20 degrees after the exhaust valve closes. The best practice, however, seems to favor opening the inlet valve immediately after the exhaust valve has become seated, say from one to three degrees on the flywheel.

The closing of the inlet valve invariably shows some lag, in one case this lag ran as high as 58 degrees while the average is about 20 to 25 degrees.

Many autoists do not understand why it is not desirable to close the inlet valve directly on dead center, they arguing that by allowing the valve to lag, a certain amount of mixture will be forced out. While this seems a logical argument, it is nevertheless a fact that the incoming gases do not follow directly upon the piston, but a vacuum, so to speak, exists between the piston head and the incoming charge. Theoretically, the right time to close the valve is at the moment of the meeting of the piston to the incoming charge. The problem of correct valve timing is one that holds a good deal of interest, because the variable engine is such an important factor.

If a motor always ran at constant speed, only a very little experimenting would be necessary to determine the proper valve setting to give the maximum power at that particular speed, but the wide limits between which the gasoline motor must operate makes it necessary to strike an average in setting the valves that will give the best power for all-around service. Probably the averages as set forth above are pretty nearly correct, at least they show what has been considered good practice abroad, and form practically the first data published on the subject.

HOW MAXIM FOOLED THE OXEN OWNER.

HARTFORD, CONN., June 15.—H. P. Maxim, the designer of the Maxim-Goodridge electric, had a peculiar experience while returning to Hartford from New London the other afternoon. On the shore road between Lyme Ferry and Niantic is a steep hill. At the bottom of this hill sits a farmer and a yoke of oxen, ostensibly to assist those in trouble. Now, then, half way up that hill there has been dumped a lot of soft loam and turf into which the wheels of a car will sink. Chain grips are useless, likewise any other such contrivance. The ruralite at the bottom of the hill is Johnny-on-the-spot and captures a little loose change. But the inventor of the noiseless gun went him one better. The car was unloaded of its passengers who walked up the hill. All turned to and cut a lot of brush and bough and these were placed over the bad spots. Then, as the car had an abundance of power, the ascent was made without the aid of those oxen, and the farmer who tried to make it appear that the dumping of the loam and turf on the road had been done to repair the highway lost a tip, and well he might.

The attorney of the Automobile Club of Hartford has been notified and will see to it that this bad spot is repaired at once and that local talent lets it alone in future.

PRESSURE LIMITED BY ATTACHMENT MEANS.

It is a more or less general opinion that there is danger of inflating a tire too hard, and many autoists believe in this to the extent of damaging the tire equipment of their cars by not inflating the tires hard enough. In order to ascertain the truth of the matter definitely, the Pennsylvania Rubber Company, Jeanette, Pa., had its testing department make an investigation. A tire was mounted on a regulation clincher rim, and subjected to a constantly increasing pressure until the gauge showed 600 pounds to the square inch. At this point, a slight expansion of the walls of the shoe was apparent and they were so hard that they sounded like wood upon being struck.

Just after passing the pressure in question, the bead was blown out of the rim for a distance of about 9 inches, showing that a well-constructed pneumatic tire will stand a pressure great enough to blow it off the rim before bursting, thus branding as a fallacy the belief that blowing the tires too hard will be apt to cause a blowout. Apart from the stretching of the walls, no damage was apparent and there was no rupture of the fabric. The Pennsylvania Rubber Company will continue to experiment and expects to find some means of holding a tire down sufficiently fast to determine at what pressure the shoe will burst.

LETTERS INTERESTING AND INSTRUCTIVE

DETECTING FAULTS IN A SECOND-HAND CAR.

Editor THE AUTOMOBILE:

[1,417.]—Will you please answer the following questions in "Letters Interesting and Instructive": (1) How to test for faults when buying a second-hand automobile. (2) How to find the primary terminals of a coil that is not marked. (3) Why is it necessary to have the secondary circuit complete when the primary is closed? (4) How is the spark retarded and advanced on the Renault car?

ROBERT BURTON.

Tarrytown, N. Y.

(1) Your first question would involve a rather lengthy reply, so we would refer you to Letter No. 1,170, which appeared on page 247 of THE AUTOMOBILE of February 20, 1908, in the answer to which the subject is gone into to the extent of almost two columns. (2) Take a set of several dry cells connected in series—the usual manner in which they are employed on a car—and attach one terminal to a binding post of the coil. Take the other wire in the hand and wipe its bare end across the other terminals of the coil, one at a time. If there is no visible effect, change the first wire to some other terminal and again proceed as before. If the battery is connected to the primary, making the circuit in this manner will cause quite a visible spark and a snap, whereas if only the secondary coil happens to be in the circuit there will be nothing seen, as the low voltage of the battery is not sufficient to overcome the high resistance of the secondary winding. Nor will there be any effect where one wire is connected to a primary terminal and the other to the secondary. The method may be varied by using a common electric bell or buzzer in the circuit, in which case it will sound when the primary is completed through it, and it will not ring through the secondary. (3) In order to prevent the secondary coil from being burned out. Every time a current is sent through the primary and the circuit suddenly broken, a corresponding current of extremely high voltage is immediately induced in the secondary. If the gap between the terminals of the secondary winding be so great that the coil cannot bridge the distance, the current will find the path of least resistance. On this account the resistance of the air-gap that a coil of a certain size will bridge is calculated to be less than that of the resistance of the insulation between its windings and where the former is allowed to greatly exceed the latter the insulation is broken down. Many makers put what is termed a "safety gap" on their coils, the resistance of this opening being the maximum that the coil will safely bridge, so that if the terminals are moved too far apart the spark jumps at the safety gap. (4) The Renault car is designed to run on a fixed point of ignition, no provision being made for advancing the spark in the ordinary manner. A magneto is employed and provision made for retarding the time of ignition sufficient to facilitate starting.

MORE ABOUT CUTTING A CRANKSHAFT DOWN.

Editor THE AUTOMOBILE:

[1,418.]—In your answer to Inquiry No. 1,401 the statement that reducing the crankshaft diameter from 2 inches to 1.1-2 inches amounts to a reduction of 25 per cent. in strength, is slightly inaccurate. The torsional strength of a solid, circular shaft is proportional to the cube of the diameter. The 1.1-2-inch shaft would, therefore, have only about 42 per cent. of the power-transmitting capacity of the 2-inch shaft.

H. H. F.

Gallon, O.

If the statement in question had been made in the way you put it, there could be no doubt as to its lack of accuracy, but if you will read it again we think it will be plain that the 25 per cent. reduction spoken of referred to the amount of the reduction and not to the strength. However, we wish to thank you for calling attention to this important factor, which should be further cause for the inquirer in question abandoning the project of cutting down his crankshaft in the manner contemplated.

"WORN VALVE STEMS MAY BE THE CAUSE.

Editor THE AUTOMOBILE:

[1,419.]—I have a two-cylinder Reo car which has lately shown a tendency to overheat, boiling the water, even after a very short run. I cannot discover any cause for it. The mixture seems to be about right. I judge this from the fact that the engine develops apparently full power and runs well. The pump is in good shape; no pipes are clogged. The lubricator is not feeding an excess of oil, neither is there an excess of oil in the crankcase. The valves are absolutely correct in accordance with the marks on flywheel, both the inlet and the exhaust. There is no carbon deposit in either cylinder, the cylinders being quite clean. Heretofore I have never noticed any such trouble with this car. I shall be pleased to receive any information that you or your subscribers may be able to give me as to the probable cause of this overheating, which as yet I have been unable to discover.

I would also like to be advised as to the horsepower of a 4-1-4 by 4-1-2-inch motor with offset cylinders, and running at an average speed. What would be the rating of such a motor under the formula used by the A. L. A. M.?

Columbia, S. C.

A. M. GIBBES.

Wear of the cams, tappets and valve stems may be the cause of the overheating you complain of, as it would not require much loss from the faces of the various moving parts that come in contact to cause a more or less appreciable difference in the operation of the valves, and as this wear tends to bring about a later action, it may be sufficient in the case of the exhaust valve to retain the burnt charge considerably beyond the time at which it should be allowed to escape. Where a motor runs at a speed of 800 r.p.m. or over, it will be evident that it is a matter of very small fractions of a second. Or, as called attention to by another correspondent recently, the cause may be due to the deposit of a fine film of scale on the inside of the circulating pipes and radiator. This scale is of a mineral nature, and, in addition to being an excellent nonconductor of heat, it is deposited in such intimate contact with the metal that the latter is practically insulated and its radiating power entirely lost and the cooling system is very inefficient.

Assuming a piston speed of 1,000 feet per minute, the output of this motor would be 28.89 horsepower, according to the A. L. A. M. formula.

INDICATIONS OF A GENERAL OVERHAULING.

Editor THE AUTOMOBILE:

[1,420.]—I recently purchased a second-hand two-cylinder Model N Ford automobile. Have had considerable trouble with it, and as a subscriber am writing for your opinion as to the cause of the trouble. The batteries are new and the vibrators also, all perfect. Only one cylinder fires regularly, although I get a good spark from both plugs. The engine will not speed up unless the spark is very high. Opening the throttle has no effect until wide open, then the engine will speed up a little. When I advance the spark very high, the engine will speed up considerably. When the engine is running at high speed there is a popping noise in the exhaust, but if I shut off the gasoline in the carbureter, or feed more, the engine dies down. At times the water boils when I have only run the car a few minutes.

Cranmoor, Wis.

H. F. WHITTLESEY.

We should say the motor was in need of a general overhauling, as is usually the case with a car acquired at second hand, and the most effective way to do this is to take it all down, clean out the crankcase, cylinders, valve pockets and the like, adjust the bearings and replace any parts that seem to be badly worn. Clean the timer and carbureter out thoroughly and after reassembling the motor see that it is timed properly. If there are any markings on the periphery of the flywheel, follow these, but if not the inlet valve, taking the forward cylinder to work on, should be set to open at the upper dead center and should remain open until the piston has started upward on the compression stroke, the equivalent of 15 to 20 degrees on the flywheel circle. The exhaust valve should open 30 to 35 degrees in advance of the lower dead center of the power stroke, again measuring on the flywheel

circle, and should remain open until the upper dead center on the exhaust stroke has been reached. The timer should be set so that the contact of the cylinder in question corresponds to the upper dead center of the piston. The spark advance lever should then be about one-third way from the end of its travel on the sector, *i.e.* one-third way from the bottom, assuming that the lever moves upward to advance. This will then give two-thirds of its travel for advancing the timing of the spark and one-third for retarding its occurrence. As the cams are fastened to the camshaft, or are integral with it, and the timer is designed to run synchronously with the motor, timing one cylinder suffices for both. To adjust the carbureter open the needle valve sufficiently to enable the motor to be started; then close it very slowly until a point is reached where the motor does not get sufficient fuel to run regularly. Reopen it slightly until the motor again runs without missing and fasten the needle valve in place at that point. Try the motor at various speeds on the throttle and see if it responds properly. If not, see that the auxiliary air valve is in good working order. With a good overhauling of this kind and proper timing, the motor should run as well as it ever did.

QUERIES CONCERNING THE TWO CYCLE.

Editor THE AUTOMOBILE:

[1,421.]—I would like to ask a few questions concerning the working of a two-cycle engine for automobile use: (a) What percentage greater consumption of gasoline has the two-cycle over the four-cycle, both motors having the same size cylinders? (b) What is the first fault to be found in the two-cycle motor after a few thousand miles' run? (c) What is the crankcase compression of a two-cycle engine? (d) Is the crankcase ever known to leak after a few months' use? T. C. Putnam, Conn.

(a) We think the two-cycle motor requires about 10 per cent. more fuel than one of the four-cycle type of the same size, but have never had any personal experience with a two-cycle motor under the varying and trying conditions of automobile service and so cannot make any definite comparison between the two, nor do we know that the above holds good. According to a well-known maker of marine and stationary motors of both types, the two-cycle, when running for long stretches under steady load, requires fully 33 1-3 per cent. more fuel than the four-cycle of the same size, but economy test records of two-cycle automobiles would not appear to substantiate this in the latter case. (b) We presume crankcase leakage would be the first trouble to develop. (c) The compression is usually three to five pounds per square inch, but in certain makes runs as high as eight pounds to the square inch. (d) Not where the joint is properly made in the first place and the motor is not abused.

ABOUT REPAIRING RADIATOR LEAKS.

Editor THE AUTOMOBILE:

[1,422.]—In your issue of May 14, in re leaks in a honeycomb radiator, you say "there is no way of repairing by simply injecting something into the water," and, in general, you are correct, but if it is a very small leak—a drop or two at a time—a handful of flour put in with cold water and when the radiator is cold, will effectually cure the trouble. H. W. BARTOL. Chateau de Ste. Helene, Nice, France.

In stating that there was no way of repairing a radiator merely by putting something into the water, we meant to infer that there was no practical way, as inquiries to this department are seldom intended to bring forth information concerning repairs of a temporary nature. A handful of bran will effect a temporary repair on the road, but anyone who has ever tried the expedient is never anxious for a repetition of the experience, as the bran becomes entrained in various parts of the circulating system and causes endless annoyance. Flour may serve to stop very small leaks, as you say, but where the leak is occasioned by a weak spot the use of such a remedy is merely putting off the evil day, as the vibration and jolting will extend the damage and sooner or later the

flour will drop out and then the orifice will be much larger than it was originally and will no longer be susceptible to repairs of this kind. At best, the latter are only makeshifts, and while they are well worth while knowing for emergency use, where it is a question of bringing a car in, they are certainly not to be recommended for every-day use where a permanent repair is desired.

DOUBTLESS THE BEARINGS ARE AT FAULT.

Editor THE AUTOMOBILE:

[1,423.]—Will you please give me your opinion of a two-cylinder opposed engine and why it will knock when you advance the spark, and also knock when you put on more power, and as you advance the power it will even lose its speed on level ground when on high gear? When car is running on low gear it runs smooth and don't seem to bother at all. Ignition is good, use storage battery and Heinze coil and Schebler carbureter, Rajah spark plugs. Will you please suggest something to do so that I can overcome my engine from knocking? Minneapolis, Minn.

ANXIOUS SUBSCRIBER.

Your statement of the case would appear to indicate that the engine is in more or less need of a general overhauling. The bearings must have too much play, which would account for some of the knocking, particularly that which occurs when the load on the motor is increased. A motor will usually run smoothly on low gear and when not loaded, even though its bearings be loose, but the extra strain never fails to make this apparent. Advancing the spark too much will always cause a knock, as the explosion then occurs slightly before the piston has reached the upper dead center, and it has to work against the pressure thus set up. The knock followed by the opening of the throttle may be occasioned by poor carbureter adjustment, the mixture being either too weak or too rich, one or the other of these conditions always causing it to burn so slowly that the exhaust is not effected in time to relieve the cylinder of all pressure before the valve closes.

MAKE-AND-BREAK IGNITION WITH BATTERIES.

Editor THE AUTOMOBILE:

[1,424.]—I have a 1½-horsepower motor using the make-and-break spark. All wiring is perfect, but new batteries do not last more than about one hour. What is the cause? B. SEYFERT. Bristol, Pa.

The trouble does not lie with either the batteries or the motor, but with the make and break ignition. Batteries, and particularly dry cells, are not adapted for service with this type of ignition, especially on a high-speed motor. Doubtless the make and break contact is not of the finest description, judging from the size of the motor to which it is attached, and the sparking contact is of unusually long duration, thus wasting half the energy of the batteries, while the legitimate needs of the igniter consume the other half. The best remedy is to convert the ignition to high-tension, or jump spark.

CONCERNING FLYWHEEL SIZES.

Editor THE AUTOMOBILE:

[1,425.]—Is there any simple rule or formula you can give us for figuring the size of flywheel we should have for a three-cylinder two-cycle motor, with bore of 6 1-2 and stroke of 6 inches? Would the same flywheel be right that it required for a six-cylinder four-cycle engine? ZIEGLER & BINSSE. Columbus, O.

The data you give is altogether insufficient as a basis upon which to give exact information, while the wording of your first question implies somewhat of a misconception of conditions. Flywheel size, within certain limits, is determined primarily by the space that is available for the placing of a flywheel. As a general rule, it is well to have a flywheel as large as possible, since the larger it is the lighter it can be for a given balancing effect. A flywheel, for instance, of a given size is simply doubled in efficiency by doubling its weight. By doubling its diameter, however, without increasing its weight, its efficiency is quadrupled—

thus proving the desirability of large size and especially of concentrating the weight in a broad and heavy rim. A three-cylinder, two-cycle engine of ordinary construction requires, other conditions being equal, a slightly heavier fly-wheel than a six-cylinder, four-cycle of the same dimensions, because of the crankcase compression, the lighter crankshaft, etc. It is impossible to give exact figures for your particular engine without knowing not only the bore and stroke, but also the compression, the minimum, normal and maximum speed, etc. And, in any case, the practice even of the best designers is unsettled in this regard.

PERMISSION TO ERECT ROAD SIGNS IN MICHIGAN.

Editor THE AUTOMOBILE:

[1,426.]—I should appreciate it if your correspondence department could give me some information of the Michigan law bearing on the subject of sign and guide posts. Who is the proper authority to grant permission for the erection of road signs?

Ypsilanti, Mich.

HERBERT L. CONNELL.

We doubt if you will find this is a matter of State law, but rather something over which towns and counties have direct jurisdiction, in which case the town or county authorities could give the necessary permission. However, this is something on which the States differ very radically, many making no provision at all. You can doubtless find a digest of the State laws in any public reference library in a large city. It is naturally a matter that would not be found in a motor vehicle law as where they exist sign post laws are usually of long standing, unless of very recent passage.

ABOUT BATTERY AND DYNAMO IGNITION.

Editor THE AUTOMOBILE:

[1,427.]—I have a four-cylinder engine in my automobile, and I am thinking about putting in a storage battery and dynamo to charge it. Now, how is a storage battery? Can you depend upon them? I have been using dry batteries. Can you start an engine with a magneto without batteries?

Louisville, Ky.

GEORGE PERRY.

A storage battery constitutes a perfectly dependable source of ignition current, and on cars having engines of more than two cylinders is usually found to be much superior to dry cells. A magneto, of course, represents the best form of ignition apparatus for the multi-cylinder car, owing to its simplicity and dependability, as well as the fact that it is self-contained. There is no difficulty in starting on a good magneto.

CARS THAT FINISHED IN THE 1905 VANDERBILT.

Editor THE AUTOMOBILE:

[1,428.]—Please inform me the makes of cars that were classified from first to fifth in the 1905 Vanderbilt Cup race.

Brooklyn, N. Y.

READER.

Hemery, in a Darracq, was first; Heath, in a Panhard, second; Tracy, in a Locomobile, third; Lancia, in a Fiat, fourth, and Szisz, in a Renault, had completed the ninth round when the race was officially declared off, owing to the crowd getting out on the course, so that only four cars finished.

SCALE GREATLY LOWERS RADIATOR EFFICIENCY.

Editor THE AUTOMOBILE:

[1,429.]—In reference to letter in "Letters Interesting and Instructive," No. 1378, from M. B. Hauser, Portland, Pa., beg to say that I think that perhaps the difficulty lies in the fact that the radiator of this correspondent's machine, and possibly the water jacket also, have become coated with "scale." Every one knows that all water contains a certain amount of mineral matter, and sometimes some portion of acid, and that all steam boilers have to be treated with a compound to prevent the pitting of the acid and to prevent scale. While water in a radiator does not necessarily boil, there is nevertheless considerable evaporation, and scale will form. I am using a compound which, I might say, was "invented" by a friend who is an expert engineer, and whereas before upon draining the radiator the water was discolored or red from rust, since using this compound it is always clear as crystal. There is absolutely no overheating, even when

running the engine at high speed for quite some time. The compound is absolutely harmless, will not injure the metal in the slightest, and is much to be preferred to caustic soda or hydrochloric acid, inasmuch as it can and should be left in the machine at all times. About one tablespoonful of the powder is used to the quantity of water contained in the radiator, and, therefore, a pound or two, which would cost about 50 cents, would last an average motorist an entire season.

I have no doubt that many of your readers will be interested in this matter and that they would obtain much better results if they would use something of this nature to keep the cooling system free from dirt and scale. If Mr. Hauser will try some remedy to free his radiator and engine from scale I believe that he will experience very little trouble. Many people are not aware of the fact that so small a deposit as one-hundredth of an inch of scale will very seriously affect the cooling system, as scale is a non-conductor of heat, consequently the air has practically no opportunity of cooling the water as it becomes heated.

Sharon Hill, Pa.

W. S. HAGAMAN.

IN SUPPORT OF INTERNAL PROTECTORS.

Editor THE AUTOMOBILE:

[1,430.]—In a reply to a letter published in "The Automobile," No. 1,405, written by H. C. Cresley, relative to his experience with internal tire protectors, we wish to say a few words.

In the first place, we know of no such party as H. C. Cresley, who claims to have had a pair of our protectors size 36x3 1-2 in two Michelin shoes, on the front wheels of his car, who states that in the very short distance of fifty miles, that the discs in the protectors worked loose and ruined the shoes and tubes. We can account for every 36x3 1-2-inch protector that has been placed on the market in this territory, and we know that none have been placed in the hands of the above-named party. Further than this, we have traced down every protector of this size that has been sold, and find that they have all been giving the very best of satisfaction.

The only circumstances under which a protector could go wrong would be in a case of defective workmanship, and in the manufacture of tires and tire equipment, no matter how carefully the output is supervised, occasionally some defective stock gets through, but we stand ready to replace anything that should prove defective, upon its being submitted to us for our inspection. If the facts had been as Mr. Cresley outlines, the logical thing would have been for him to have returned them to us, and demand an explanation as to why they acted in this way, as we fully guarantee them not to work loose.

These protectors are made to prevent punctures, and they do so without in any way injuring the casing and tube. If any one desires any information on this subject, we will take pleasure in referring them to many users who have had them in service for thousands of miles and who can recommend them highly.

WYATT & LISTMAN,

H. E. LISTMAN, Manager.

ABOUT THAT CYLINDER GRINDING PROJECT.

Editor THE AUTOMOBILE:

[1,431.]—I notice Mr. Sparenberg's answer to Mr. V. R. Lane in your issue of May 28, letter No. 1387. The trouble that anybody ever had with a gas engine will be but child's play if Mr. Lane fits his pistons according to Mr. Sparenberg's instructions and makes them tight-fitting for the cylinder. The regular practice is to grind the pistons conical, making them from about .008 of an inch smaller at the top than the bore of the cylinder, and about .005 of an inch smaller at the bottom. It does not matter much, within certain limits, how loose the piston is in the cylinder provided the rings are properly fitted, but if the piston is fitted in a gas engine cylinder in the same way that steam engine pistons are fitted, the piston will surely expand and stick in the cylinder. In engines intended for racing cars, or any continuous high speed work, the above allowances should be increased at least one-third.

E. T. BIRDALL.

Rochester, N. Y.

A ROAD TEST OF THE COAL-BURNING STEAMER.

Editor THE AUTOMOBILE:

[1,432.]—I took my coal burner, steel tired, no differential-on-drive axle, out Saturday morning to see if all was tight, before I painted it. It acted as I expected it would. I went up a steep grade at a 25-mile gait. In turning around and backing up the drive axle acted fine. It does not make near the noise that other gasoline cars make. A D. & H. engineer saw me go up the hill and he states that I made a 90-mile gait. With 150-pound boiler pressure it will climb any hill that a rubber tire will do; the White steamer carries 500 pounds steam pressure. I ran the car across the shop floor back and forth with two pounds pressure.

Oneonta, N. Y.

M. W. HAZLETON.

RECENT ACCOMPLISHMENTS OF THE AIR PILOTS

ROME, June 10.—Fifteen minutes 25 seconds have been spent in the air by Leon Delagrangé, the French aeronaut, mounted on his Voisin flying machine. The exhibition, which proved to be a world's record, took place on the Place d'Armes before 6 A. M. before a large concourse of people and many members of the aeronautical societies of France, Italy and America; among the latter was Cortland Field Bishop.

After the ground had been carefully measured out, Delagrangé gave the order to start up the motor. A couple of men seized the big propeller, swung it round briskly, and a second later the eight-cylinder Antoinette engine was humming merrily. After two minutes on the ground the apparatus rose in to the air to a height of two or three yards and commenced a huge circular movement. Ten rounds were covered, the height slightly varying, but never falling below one yard from the ground. When fifteen minutes had passed Delagrangé was still aloft soaring through the air as perfectly as the moment he left the ground. Twenty-five seconds later, to the wild cheers of the enthusiastic spectators, the apparatus gradually came to earth,

to be competed for although a flight of a quarter of an hour is officially accomplished. At the Buc grounds near Versailles, at Trappes, near Paris, or on the Issy-les-Moulineaux ground under very strict police control, it is possible that Delagrangé or Farman will make an attempt to win the Armengaud prize immediately on their return from abroad.

Farman Carries Passenger and Wins \$1,200 Bet.

GHENT, Belgium, June 10.—While his friend and rival Delagrangé was creating a world's record at Rome, Farman was busy on a unique performance in the neighborhood of Ghent. A few months ago a bet was made by Ferdinand Charron with Farman, Santos-Dumont and Archdeacon, that an aeroplane would not cover a kilometer with two men on board within a period of one year. Charron has lost his \$1,200, for just outside the old Flemish city Farman traveled 1,241 meters (1,356 yards) with M. Archdeacon on board his apparatus. The flight might have been longer had the length of the ground permitted an extension of the trip in a straight line.

Henry Farman's flight of 1,356 yards with Ernest Archdeacon as passenger, has been officially accepted by the Aero Club of France as the record for heavier-than-air machines with two persons on board. According to the report of the commission, the apparatus covered the distance without once touching the ground, the distance from the earth at certain moments being 26 feet. As soon as the aeroplane came to earth at the extremity of the field, the ground was measured by means of surveyors' instruments. To prevent any possibility of error, members of the commission were placed along the ground to be covered at distances of 200 yards, and an automobile carrying committeemen followed the flying machine.

Wrights Make Preparations for European Tests.

PARIS, June 10.—At last France is to know the truth about the Wright brothers. Wilbur Wright is now here and this week left for Nates with his apparatus packed in cases. Within two months, according to the promise of the Parisian agent of the brothers from Dayton, the American aeronauts will have made a public demonstration and proven to the world that they are the champions of the upper regions. Meanwhile French aeronauts remain skeptical.

The Wright brothers are well known in Paris, having spent a considerable amount of time here last year, watching the French experiments and visiting the various aeronautical shops. There is a disinclination to put them down as bluffers, nevertheless a strong feeling prevails that they have not accomplished all they claim. French aeronauts have arrived so gradually at the results achieved that the public refuse to believe that the Wright brothers have accomplished more in a very much shorter space of time. Delagrangé having covered 7.8 miles in fifteen minutes and Farman having traveled nearly a mile in his apparatus with one passenger on board, Parisians are confident that their champions are now ahead of the two Ohio brothers.

There is no doubt whatever that preparations are being made for a flight, for the machine has been shipped under cover to the western town and Wilbur Wright has obtained permission from the authorities to use a large tract of plain for his experiments. The ground chosen has an area of 130 acres entirely without trees and protected by surrounding hills from eastern, northerly and western winds. As an aeronautical training ground the spot is perfect. An order has been given to a local builder to erect a shed 50 feet long by 30 feet wide and to lay down rails on which the apparatus will run to attain speed for rising from the ground.

The flying machine, which is now at the Chateau de Fonpétan, the residence of M. de la Reinty, a Frenchman interested in the American aeronauts, will be assembled in about ten days and flights made early in July.

Farcot Air-cooled Eight-cylinder Airship Motor.

The cylinders are ranged about a common center as shown, there being but a single crankthrow, to which all the connecting rods are attached. Power is taken from the shaft shown extending at right angles. Automatic inlet valves are employed. The motor is rated at 35-horsepower and is extremely light.

the Italian prize for a flight of a quarter of an hour having been clearly and fairly won. Delagrangé had gained \$8,000 by his morning's flight of 7.8 miles.

Later in the morning, before the French ambassador and a number of the members of the Court, Delagrangé attempted to repeat the experiment, but owing to the force of the wind was obliged to abandon the attempt.

On the following Monday, while giving a final performance before the Queen Mother and a large crowd of spectators, Delagrangé met with a slight accident. After completing a round the apparatus got out of its course and threatened to collide with a stack of wood. In order to avoid a collision the aeronaut operated his rudders with such brusqueness that he brought the machine down to earth, a distance of about four yards, with a run. Delagrangé was fortunately uninjured, and the damage to his machine was only of a trifling nature, easily repaired by a few hours in the aeroplane workshop.

By his performance at Rome Delagrangé is entitled to the \$8,000 prize offered by the Societe Aeronautique Italiano, but has not won the Armengaud \$2,000 prize for a flight of fifteen minutes. The regulations for this event declare that the flight must be made on French soil and before three members of the commission appointed by the donator. Thus this prize still remains

Across Pennsylvania in a Runabout

By Louis P. Reeder

FROM Meadville to Philadelphia, and from the Quaker stronghold to New York is a trip we accomplished in a 75-horsepower runabout. Meadville being on the north-west corner of Pennsylvania, near the Ohio line, our run was a diagonal one across the State, following generally the line of the Philadelphia and Erie Railroad. The party consisted of my wife, her sister and myself, the machine to accommodate us being a three-seated runabout with its extra seat on the left running board. This arrangement I believe to be better than the rumble seat behind, and it is certainly more sociable. Before starting out I looked the car over carefully and in my desire not to be unprovided added a stock of tools sufficient to rebuild the car if necessary, so it seemed. After all the precautions, however, I made the mistake of not carrying enough spare inner tubes and shoes, having only one of each.

We left Meadville about 10 o'clock of as fine an October morning as it would be possible to imagine, when autumn coloring was at its best. We headed for Warren, about sixty miles away, with no schedule to make, and the freedom to stay on the road two weeks or one, just as we pleased.

Our troubles commenced about ten miles from Meadville with a slipping clutch. Of course Fuller's earth was one of the things I had not placed in the trouble box, and not one of the drug stores we passed on the way to Warren could supply it. However, one store gave us some crocus martus which helped us on to Warren, where we got the necessary Fuller's and the can to apply it. Arriving at the Carver House, lunch was dully appreciated, for we

run the car in his barn over night, though he would not wash it for any consideration. We found a political demonstration under way at the

New Fleming, our hotel for the night, but in spite of the crowd managed to secure good accommodations. Our baggage, which was carried on a rack on the rear of the car, was a mass of mud, but it was partially protected by an oilcloth and the mud and water had not soaked through the trunk walls.

The next morning, rain. However, it gradually turned into a light drizzle and I got the car out. I flushed out the cylinders with kerosene and located the cause of the slipping clutch. The drip pan on the car lies up close to the flywheel. The drain pipe from the pan had become stopped with mud and oil which had collected in sufficient quantity to splash up on the leather-faced cone clutch enough to make it slip. I had no further trouble after cleaning the pan.

I got the hotel porter to wash out the radiator with his hose. It was practically solid with mud and had caused the motor to steam during the last few miles the previous afternoon. My own experience shows me that the cooling system on a high-power six-cylinder car must be kept in perfect condition to give satisfaction. Of course this is the case with cooling systems on all motors, but I believe the cooling system on a four-cylinder motor will stand more abuse than one on a six. I have to keep the fan belt pretty taut to cool under hard work, and I believe a gear-driven fan, provided it can be run quietly, is preferable.

A Genuine Friend of the Automobilist.

We intended to make Lock Haven that evening, but it took us two days to reach that point instead of one. Since Kane is at the top of the ridge, our road was in general a long down grade through Ridgeway to Emporium. These towns are about twenty-five miles apart, as I recollect the distance, and about midway between the towns the road would gradually fade away to a mere lumber trail overgrown with grass and bushes; but as we neared town again it gradually grew better until a few miles before entering Emporium we ran on to a new and excellent State road. We took lunch at Emporium, and I afterward made some inquiries concerning the roads through Driftwood to Lock Haven. I had supposed there must be some sort of carriage road down the valley through which ran the Pennsylvania and Erie Railroad, but found I was mistaken. It appears there is nothing

had had rather rough and hilly roads thus far, though better than those found later.

At 2:30 we were on the road again, heading for Kane, thirty miles, the entire distance up hill. Kane is claimed to be the highest town in the State. The first two miles of the road out of Warren were along the north side of a mountain and were about hub deep in gravelly mud; it was rough going, but it would have been rougher had it been clay. There is a better road on the other side of the river, via Glade, but repairs on the bridge at the latter place put it temporarily out of use and so compelled us to take the south side of the river. We struggled through without chains, however, and had fair roads and fine scenery the balance of the way to Kane. The country is thinly inhabited and scenes of abandoned timber operations were frequently passed, giving it a singularly desolate appearance. Kane has no garage, but a livery stable keeper allowed me to

beyond a trail through the woods from a few miles below Emporium. I eventually met a Mr. Brady who put me right. Now, this Mr. Brady is a man to look out for; he will load you up with oil and gasoline and anything you haven't got, and won't take anything for it but thanks, and is even shy about that. Mr. Brady informed me that I had better turn northeast to Coudersport, twenty-five or thirty miles (provided you don't lose your way) and then turn south to Lock Haven. This good Samaritan wound up by showing us the way out of town for seven miles and then gave us careful directions for the rest of the road to Coudersport. That's the kind of an automobile fiend it is a pleasure to meet, May his tribe increase!

The roads were fair for a time and I anticipated no trouble in reaching Coudersport; but it gradually grew rougher, and when it seemed likely to fade away entirely I asked a few questions of the natives to get my bearings. The hills in this region are steep and to get over them it is necessary to resort to the "switchback" road, which zigzags up the side of a mountain at a good stiff grade with some mighty short turns at the angles, especially short for a 122-inch wheelbase car. These roads are not frequently met in general touring, however, and I believe the long wheelbase has advantages which compensate for the disadvantage just mentioned. When we ran into Coudersport and made inquiry we were told there was no passable road south, but must continue to Galeton, twenty-five miles further east. The road was very rough and we did not pull into Galeton until about 6 o'clock in the evening, by which time it was already dark and the arc-lighted sawmills just at the western end of the town gave Galeton a very spectacular appearance. During the last ten miles I had some magneto trouble owing to my having dashed water on the radiator to clean it a little, while the motor was running, the consequence being a wet magneto.

This Road Last Repaired Fifty Years Ago.

We found a good hotel, of which I have forgotten the name, but no garage, and again I had to run the machine under a shed. I drew off the water to prevent freezing, and it was a precaution well taken, as it was far below freezing the following morning. I was informed by several people that even now I could not turn south, as the road, the old Coudersport Pike, was built seventy years ago, had not been repaired for fifty, and I had better continue east to Wellsboro before making a turn for the south and the west branch of the Susquehanna. I finally met a man who had driven with a horse and carriage through this road to Lock Haven the preceding summer, and he advised me that by careful driving I could make it. A company of U. S. infantry had been through the year before, and had repaired the bridges enough to let a wagon train through.

I decided to take the pike route, and in the morning we started for Germania, eleven miles, all up hill, then down to Oleona, the scene of Ole Bull's colonization scheme. Apparently nothing remains of the town but a house and barn and some ruins.

The road from this point on to Lock Haven is practically forty miles of wilderness. It climbs to the top of a ridge and follows it for miles. I believe we could see across thirty miles of other ridges east and west, all in their fullest autumn glory. The road was fair in spots, but a great deal of it was rotten corduroy. The corduroy road was built with logs of a pretty good size and where all the soil was gone from the top it is needless to state that riding over that particular road was no joke. About noon I carelessly ran too close to the edge of the road; the rotten ends of the logs gave way and dropped my left rear wheel sufficient to let the tool box and differential casing rest on the ground. The car is heavy, and it took me over an hour to jack up the car and gather enough stones to make a foundation to run out on. We passed Pumping Station, consisting of four families and an equal number of oil tanks.

The road through this section is very narrow and badly washed, usually taking the form of a ditch, or trench, two to six feet deep, and just wide enough for the car to scrape through. The road being closely overhung with scrub and undergrowth of

all kinds, our faces were pretty well whipped and scratched. At length, in the afternoon, we descended a long hill, remarkable for the number and size of its waterbreaks, to Lock Haven, on the West Branch. From this point on we were at least sure of traveled roads and a settled country. I ran the car into a garage for a washing, the first since leaving Meadville. It rained that night and the following morning, but at noon the weather cleared a bit and we decided to start for Williamsport. Of course our starting was the signal for a heavier downpour than ever. It took two hours to run the twenty-five miles. The roads were the usual "soft soap" variety, and it was impossible to hold the machine. We were in the ditch several times, in spite of chains. I carried another friend with us to Williamsport. Our chains broke and he was well initiated into the pleasures of automobiling by the time we arrived, soaked through. However, we found an excellent hotel, and an equally good garage. We stayed over the next day to give the roads an opportunity to dry up a little, and I improved the leisure to have the machine cleaned and a leaky radiator soldered, the twisting received over the mountains having started a slight leak.

Tire Trouble—but the Tires Were Not to Blame.

Up to this point I had no tire trouble, but we got it on the run to Harrisburg the following day. I mistook a small blowout for a puncture, put in my only spare tube without a careful examination, and in consequence had another blowout, a big one this time, in a couple of miles. I then patched the first tube as well as possible but it gave out in five miles. I ran on the flat shoe until it ran off, then tied it on with rope. The shoe finally cut in two and I ran three or four miles on the bare rim to Clark's Ferry.

We were only eighteen miles from Harrisburg, and I sent word in by a passing machine to send out a new tire or at least a machine to take us into town, but, though I afterwards found the garage was notified, for some reason they did not have energy enough to start out a machine for us. We waited from 5 P.M. until 10 P.M. and took the train for Harrisburg, dead tired. I got a blowout patch and a new tube the next morning and brought the machine to town. It was necessary to borrow a couple of crowbars from the section hands on the railroad nearby to straighten out the rim, which we had rolled down by running on it bare.

We finished the trip to New York over the well-known route from Harrisburg, via Philadelphia, without further incident other than blowing out two more tires. Being in a civilized country by this time we were able to get tires promptly and proceed.

I had put an extra gallon each of oil and gasoline in the tool case on the rack in the rear, but the cans were punctured and the oil and gasoline distributed over the tools before we had completed half the trip. We enjoyed the trip thoroughly, though there are some few incidents more pleasant in the recollection than the participation, such as the five-hour wait for a train at Clark's Ferry. The thirty or forty pounds of extra tools could have been profitably replaced by some Fuller's earth and a few spare tubes.

THINK VISITORS SHOULD BE EXEMPT.

BALTIMORE, Md., June 8.—Local autoists are of the opinion that autoists from other cities should be allowed to pass through the State of Maryland without having to procure a Maryland license. They have, also, urged that the Maryland law be changed so that the visitors may be permitted to remain in this State unmolested for 24 hours. Under the present law visitors are required to obtain a Maryland license before they bring their car into the State. This has resulted in the arrest recently of many visitors, who have been fined \$1 and costs, for not having Maryland licenses. The local autoists believe that an arrangement should be made here so that visitors could enter the State and get licenses at court houses in any of the cities and towns of the State, instead of having to obtain these licenses before entering Maryland, from the officials at Annapolis.

PRINCE EDWARD ISLANDERS FIGHT LAW.

CHARLOTTETOWN, P. E. I., June 15.—Automobile owners of this city have held a conference and have decided to test the validity of the recent act of the Provincial legislature authorizing counties and municipalities to bar automobiles from the roads, many of the counties and towns already having done so, Charlottetown being among the number. A circular has

Riding Out to Defy a Medieval Law.

been issued calling attention to the fact that a franchise was granted to a company to run motor vehicles as far back as 1902, and in 1906 a second was issued to run trackless trolley cars, neither of these acts having met with any protest. They further point out that as no indemnity has been provided for by the recent act, the machines owned in the Province will be a dead loss. The accompanying photograph shows the opening of the test case, the car being run through Charlottetown's streets on one of the forbidden days, so that the hour's ride may cost the participants a \$500 fine or six months in jail, if the act be upheld. W. K. Rogers is driving the car, Bruce Stewart is beside him, while the occupants of the tonneau are J. A. S. Bayer, Dr. Allen and George E. Auld.

NEW ORLEANS WANTS AUTO SHOW.

NEW ORLEANS, June 1.—"An automobile show for New Orleans and the South this fall" is the slogan of local automobile dealers and enthusiasts. The plan has been talked over by the local dealers for some time, and while the plans are still in their infancy, still the prospects are good. The automobile dealers of this city and the South have been quick to take up with the favorable public sentiment that has been created by the good roads proposition and also the success of the Savannah races and will use it to still further advantage. They argue that the time is now ripe for a Southern automobile show to be held here in the metropolis of the South.

The South is being recognized more and more as one of the most fertile fields for the automobile industry, were it but fostered and cultivated. Those who are at the head of the movement for the show are meeting with great encouragement from all over the South and from the various manufacturers themselves.

The opening of the Legislature at Baton Rouge sees the Louisiana Automobile League hard at work. They have established a lobby there, which will work for the advancement of the good roads proposition and also look after the interests of the automobilists. The lobby is composed of good, careful men and it will be conducted in a clean, above-board manner. It is hoped to get the Legislature to build a shell road from Baton Rouge to New Orleans, a distance of about one hundred miles. This road is to follow the Mississippi river and will be one of the most picturesque in the South.

BALTIMORE TRIES OUT DUST LAYERS.

BALTIMORE, June 8.—An experiment is being tried here which promises to do away with the dust nuisance during the coming summer on the highways traversed extensively by autoists in going to and from the city. This dust preventive, intended chiefly for macadam roads, is called terracolio, a bitumen compound. The experiment has been conducted by Commissioner of Street Cleaning Wickes, on Park Heights avenue, back of Druid Hill Park, which is the most popular thoroughfare in and around the city for motorists, and he declares that the results have been quite satisfactory. The material is black and resembles pitch. It is mixed with water in the road sprinklers. The road has shown no effects from its application, except for the absence of dust. The mixture was first applied at a strength of an 18 per cent. solution with water. This solution will be reduced gradually until a 2 per cent. solution will be used permanently.

AUTO FIRE APPARATUS FOR SPRINGFIELD.

SPRINGFIELD, MASS., June 15.—Automobile fire apparatus is very popular in this city as will be shown by the recent action of the city council's finance committee in recommending that two more motor power wagons be added to the present automobile equipment. One wagon is to be a combination hose and chemical truck, the other to be a regular hose wagon. These wagons are to be put in the Chestnut street engine house, which will be an automobile station only. There is at present a flying squadron stationed there, the wagon being a Knox type. It is estimated that the wagons will cost about \$3,000 each. The committee also recommended that another automobile patrol wagon be built for the police department, the style of which has not been decided upon.

COMMISSIONER MACDONALD'S NEW AUTO.

HARTFORD, CONN., June 15.—Highway Commissioner James H. MacDonald, of Connecticut, is not only one of the most able and persistent advocates of the cause of good roads, but he realizes better than probably anyone else in a similar position the value of the automobile for his use. In the accompanying photograph he is shown in the new Pope-Hartford car recently delivered to him by the Pope Manufacturing Company. It is finished in a light mahogany brown with black enamel trimmings and has a number of special devices on it not often found on the average touring car. There is a special

Specialty Equipped Pope-Hartford Road Car.

rack made to accommodate a typewriter and a stenographer will accompany the commissioner on all his runs. There is also a special type of gradometer and a most complete system of electric lighting. The State seal on the doors adds to its imposing appearance. With the aid of his new car Commissioner MacDonald will be able to cover many times the territory and increase his scope of usefulness to Connecticut's progressive good roads campaign which is now in full swing throughout the State.

FAUBER PERFECTS HYDROPLANE.

PARIS, June 3.—What is probably the first attempt in Europe to present the hydroplane as a comfortable cruising craft is due to an American inventor, W. H. Fauber, who is still well known in the States by reason of his connection with the cycle industry, and his proprietorship of the Fauber Manufacturing Company, at Chicago. He has been working for a couple of years on an improved type of hydroplane and has now so far perfected his models that he has made arrangements for the building of his craft for the public.

The Fauber hydroplane, which would have taken part in the Monaco meet but for delays in the issuing of patents, has undergone its trial trips in the Seine at Nanterre, near Paris, and has covered the measured kilometer in 60 seconds dead, which is at the rate of nearly 38 miles an hour. With some slight improvements in lines and propeller, it is believed by Fauber that he can carry the speed to rather more than 40 miles an hour.

Distinctive in the Fauber hydroplane is the fact that when at rest in the water it has all the lines of a graceful displacement boat. Its sharp bow cuts the water clean and its special type of hydroplanes, about which the inventor does not wish to be communicative, assure it a stability that has been totally lacking in this class of boat up to the present. Fauber is so well pleased

Fauber's Hydroplane at High Speed.

with the results obtained in his racing craft, which he claims to be faster and capable of operating on rougher water than any other hydroplane yet built, that he has made arrangements for the construction of a series of 21-foot boats to be fitted with a four-cylinder engine and used as pleasure cruisers. A 26-foot racer which will embody all the improvements suggested by the present racer is also under construction and will be tried out on the Seine during the summer. The Fauber racing boats are equipped with eight-cylinder Antoinette light-weight engines of 50 horsepower.

THE CARRIAGE WAITS "WITHOUT," MY LORD!

"The carriage waits without, my lord."

"Without what, gentle sir?"

"Without the left-hand running-board,

Without the French chauffeur,

Without a drop of gasoline,

Six nuts, the can of oil,

Four pinions, and the limousine,

The spark-plug, and the coil;

Without the brake, the horn, the clutch,

Without the running-gear,

One cylinder—it beats the Dutch

How much there isn't here!

The car has been repaired, in fact,

And you should be right glad

To find that this much is intact

Of what your lordship had.

The garage sent it back, my lord,

In perfect shape throughout;

So you will understand, my lord,

Your carriage waits without."

—"Harvard Lampoon."

THE AUTOMOBILE CALENDAR. AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
- Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
- Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
- February, 1909. —Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers.. (Exact date to be announced.)

Races, Hill-climbs, etc.

- June 20-26.....—Albany, N. Y., Annual Five-day Tour of the Albany Automobile Club.
- June 24-27.....—New York and Philadelphia, Double-Head Endurance Run to Delaware Water Gap, under the auspices of the "Public Ledger" of Philadelphia.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- June 27.....—Norristown, Pa., Skippack Hill Climb, Norristown Automobile Club.
- July 4.....—Long Branch, N. J., Race Meet, Elkwood Park Automobile Association.
- July 4.....—Lowell, Mass., 250-mile Road Race, Lowell Automobile Club.
- July 4.....—Wildwood-by-the-Sea, N. J., Annual Speed Tournament, Motor Club of Wildwood.
- July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
- July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
- Aug. 14.....—Chicago, Third Annual Algonquin Hill Climb, Chicago Motor Club.
- Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.
- Oct. 24.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.

FOREIGN.

Shows.

- Oct. 11-18.....—Paris, International Congress and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.
- December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill-climbs, etc.

- July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France.)
- July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- Aug. 12.....—Ardennes Circuit Races and Coupe de Liederkerk, Automobile Club of Belgium.
- August.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
- Sept. 1-8.....—French Voiturette Contest, Auspices "L'Auto."
- Sept. 6.....—Bologna, Italy, Florio Cup Race, Automobile Club of Bologna.
- September.....—Paris, Vichy Aeroplane Competition, \$4,000 Prizes, Aero Club of France.
- Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

Summit, N. J., is the latest town in the State across the Hudson to work a speed trap. The trap itself is actually in New Providence, which is only a name, and on Springfield avenue, west of the West Summit station. It is located where a road crosses Springfield avenue diagonally from the northeast, and the presence of the crossing is considered sufficient excuse to compel autoists to slow down, or rather to be trapped because they do not do so, under the clause in the law requiring a speed of fifteen miles an hour "at prominent intersections."

HIGH PERCENTAGE IN FRENCH COMMERCIAL TEST

PARIS, June 10.—It is somewhat embarrassing to pick out the winners in the industrial vehicle competition that the Automobile Club of France has just brought to a close after one month's traveling in the north and west of France, for the cars are so closely grouped that all might be considered victors. A fuel consumption test on the last stage of the journey can hardly be taken as conclusive, all kinds of fuel being allowed, and thus, by reason of differences in price arbitrarily dividing up vehicles that were otherwise on an equal footing.

Thirty-five industrial vehicles, from light-weight delivery vans to 5-ton trucks left Paris a month ago. Of this number twenty-four have entered the capital under official recognition, having changed nothing more important than spark plugs, valve springs, etc.; in a word, with the mere exchange of such parts as are always carried on any long-distance touring car. In addition to motor transmission and all running gear, tires and wheels, hitherto the weakest part of heavy trucks, were sealed and came back to Paris on the victorious twenty-four. A small number finished the run and made all controls on time but were disqualified for slight accidents to machinery which could be repaired on the road, but necessitated the changing of some sealed part. Thus, a front-drive truck burned out the bearing of one of its rear wheels free from all driving mechanism. The repair necessitated taking off the wheel and entailed disqualification although all other conditions were filled. In the same way another truck was obliged to retire from official observation by reason of one of its rubber blocks having to be changed.

In the cab competition two out of the eleven vehicles had to withdraw owing to the changing of sealed parts. The nine others made all controls on time and returned to Paris after a month's traveling with every part intact. The net result is surprising, 68.5 per cent. clean scorers in the truck classes and 82 per cent. in the cab section, under rigorous rules, being a proportion never attained in any previous competition.

It might be objected that the cab competition was not so thorough as that for the commercial vehicles, the long straight-away runs that had to be made over roads that were excellent on the whole not being so trying to the mechanism as a varied service in crowded city streets often badly paved and ill kept. For the trucks the competition was harder than actual working conditions, the full load having to be carried continuously, whereas under commercial conditions there is a certain proportion of running light. One reason for the great success of the vehicles is the fact that speeding with the heavy trucks was eliminated by a system of frequent controls. A commercial speed was demanded and insisted upon, thus at the same time proving the qualities of those vehicles suited for heavy transport and preventing premature wrecking of machines.

The official classification was made on a fuel consumption test of 69.6 miles over various roads not sufficiently hilly, however, to allow the vehicles to do any coasting. The formula

employed was $\frac{TC}{PD}$, in which T was time in hours, C cost of fuel

in francs, D distance covered and P the total weight. As the fuels allowed were the following, gasoline at 40 francs 50 per hectolitre, white spirit at 27 francs 75, carbureted alcohol at 33 francs 70, and benzol at 24 francs 65, the users of gasoline were naturally handicapped. The cabs were on an equal basis in this respect, all having to run on alcohol for the entire distance; speed limited to 20 miles an hour, there was in reality a slight advantage to low-powered single and two-cylinders.

Under the general classification first prize goes to a Saurer truck, manufactured by the well-known Swiss firm at Arbon. With a useful load of three tons and a total weight of six tons, the Swiss truck covered the 69.1-2 miles on 4.4 gallons of white spirit. Second position fell to a little single-cylinder De Dion of 3.9 bore by 4.7 stroke which, despite its small power plant, carried a load of one ton and a half for an entire month without any signs of weakness. The third prize went to a Saurer passenger 'bus in the class for more than ten people, fourth to a light delivery Panhard, and fifth to a 3-ton Saurer. Though it permitted of a complete classification, the fuel test tended to make confusion, for it arbitrarily divided vehicles that were otherwise equal. Those eligible for and taking part in this final test comprised 4 Dietrichs, 3 Saurer, 3 Panhard, 2 Cohandet, 1 Vinot-Deguingand, and 1 Brohout, all of which had their full teams in at the end of the competition. Berliet presented 7 trucks, having lost one on the journey through a defective rubber bandage. De Dion was eligible to put in two of his three competing vehicles, and Peugeot had but one perfect scorer out of five starters.

Six of the perfect scorers are eligible for purchase by the army, having fulfilled all conditions set forth in the military regulations. The trucks comprise two Berliet, two Cohandet, one Vinot-Deguingand and one Panhard. It remains for the constructors to arrange terms with the military authorities.

The fuel consumption test for the cabs gives first place to a two-cylinder Dorion-Flandrin, which consumed but 1.3 gallons of alcohol for a distance of 69.5 miles. A single-cylinder Brouhot made the same distance on 1.8 gallons. Bayard-Clément was the most economical of the four-cylinder cabs, as was proved by the consumption of 2.2 gallons for the same distance. The winning Dorion-Flandrin had at its power plant a 10-horsepower engine of 3.1 and 4.7 bore and stroke, Longuemare carbureter and Bosch high-tension magneto. The feature of the Brouhot which took second prize for fuel economy was a single-cylinder engine of 9-horsepower, bore being 4 inches and stroke 5.1. Unlike the others, transmission was by belt, completely enclosed to protect it from dirt and oil. This type of transmission, neglected for some time by constructors, is now gaining popularity among the makers of small pleasure and commercial vehicles and bids fair to be revived to a considerable extent.

HEMERY CAPTURES ST. PETERSBURG-MOSCOW HONORS

MOSCOW, June 6.—Hemery, after lying quiet since his break away from the Darracq eight-cylinder flyer, has secured a notable victory by taking the first prize in the St. Petersburg-Moscow race, covering the 425 miles on his Grand Prix Benz in 8:30:48. Last year's record, made by Duray, has been beaten by 52 minutes. Second place was secured by Demogeot, driving the four-cylinder Darracq racers which Caillois handled in last year's Grand Prix. His time was 8:42:12. Third place in the high-powered class goes to the English driver Pope, handling an Itala. The cars in this class which failed to finish included

a full team of Dietrichs, a Fiat and a Mercedes. By winning this race on the actual machine which he will drive in the Grand Prix Hemery has enormously increased the esteem in which he is held by the public as one of the probable winners of the race on the Dieppe circuit. No other car built for the Grand Prix is sufficiently advanced to be able to start in a race five weeks before the French Automobile Derby.

Wagner has taken first prize in the second category reserved to cars not exceeding 130 millimeters bore, running the Fiat racer of last year from St. Petersburg to Moscow in 8:49:48.

SHOWING UP BOTH SIDES OF THE CASE

Throughout all the host of accusations that have been hurled against the automobile as a destroyer of the roads, nothing whatever has been heard of the far worse activities in the same direction that the horse is responsible for, and that he has been responsible for since the dawn of history. By long association, we have grown so familiar with the damage done by the horse and wagon that we do not look upon it in this light. Consequently, those who most rabidly denounce the automobile as a road destroyer look upon the holes and ruts created by its slow-going predecessor as a perfectly legitimate form of wear and tear against which no objection can be raised. Of course, this is a prejudiced view, but then so are the majority of other objections raised against the power-driven vehicle. The automobile leaves a mighty cloud of dust in its wake passing along a country road, and, to say the least, this is annoying, but if it were not for the manner in which the horse and narrow-tired wagons pulverize the road surface there would be nothing like as much dust present, while the horse raises more than the auto, speed considered.

It is not to be contended for a moment that the automobile does no damage to the roads, but it is a fact easily demonstrated to the satisfaction of the most skeptical that at the speeds ordinarily averaged by automobiles the car is actually a road-improver rather than a destroyer.

There can be no denying the fact that above thirty miles an hour, the passage of the pneumatic tire creates considerable suction and tends to lift the top dressing, and in skidding round curves at speed the latter is forcibly removed to the outside of the curve, but by no stretch of the imagination can the automobile be truthfully accused of creating deep, narrow ruts or the numerous heavy "pock-marks" to be found on the best of road surfaces, and that are characteristic of the horse's passage. When the matter is considered impartially, it will be found that the horse is responsible for a far greater measure of damage than the automobile, and it is, moreover, of a nature not easily prevented or repaired. The use of an effective binder, properly applied, makes a road on which the automobile does little or no damage even at racing speeds, except on curves, and properly built roads will be free from even this, but the horse is a road-destroyer even when he is standing hitched. A little consideration of both sides of the question should do much to mold popular opinion to a more equitable view of the case.

ENTERING UPON A NEW ERA OF PRICES

Ever since the automobile assumed sufficient importance to demonstrate the fact that it had come to stay, and was not the fad of the moment, there have been an endless number of prophets, who, figuring by the precedent set by the bicycle, have been predicting the coming of the "poor man's automobile." When, after a number of years of steady development, a good bicycle could be purchased for \$50, it was really a machine that embodied far better material and workmanship than its predecessors that sold for three times as much. Merely because a great deal of thought and capital had been steadily devoted to its betterment. The past five years have brought forth corresponding advances in the case of the auto.

Whether there will ever be such a thing as the "poor man's automobile" has been discussed pro and con on several occasions in these columns and nothing that has happened in the interim can be considered as sufficient cause for altering opinions there set forth. But that the time has come when it will be possible for the man in ordinary circumstances to maintain an automobile that is neither a cheap, low-powered car or one that is merely a low-priced imitation of better things, has actually arrived, now appears to be a fact. Numerous American makers have brought forth extremely creditable productions in the shape of low-priced cars in past years, and the number of these machines that have been sold, as well as the service they have performed, forms an imposing record of their success. But, after all, few, if any, of these little machines satisfied the ambition of the newly fledged autoist for very long. As a stepping-stone to bigger and better things in the shape of a car, they served their purpose admirably, and proved an excellent initiation, but not every investor can afford to go through this process of education. The man with the low-priced car found it lacked many things, once his first pride of possession wore off. Judging from some of the new models recently announced, designers have had their eyes open to this state of affairs, and their productions reveal it in no uncertain manner. In fact, it seems safe to predict that the passing of 1908 will mark the beginning of a new era in automobile prices and values.

BUFFALO CONVENTION IS OF NATIONAL IMPORTANCE

OFFICIAL recognition is being accorded on every hand of the importance of the Good Roads and Legislative Convention called by the American Automobile Association to meet at Buffalo, July 6, 7 and 8. Illustrative of this is the letter which is being sent out by State Engineer Skene, of New York, to the town boards and supervisors of 934 towns. It follows:

A National Good Roads Convention will be held in the City of Buffalo, July 6, 7 and 8, 1908. This will be the first National Good Roads Convention to be held in this country in which the several State highway officials, the farmers, as represented by the National and State granges; the motorists, as represented by the American Automobile Association, comprising over 200 clubs, and the Road Makers' Association, will cooperate.

One of the most important features of this convention will be the practical demonstration of highway maintenance and construction. Seventy-five miles of road will be in course of improvement and within easy access of the city of Buffalo, and about twelve miles of road will be used to demonstrate the several dust-laying and road-surfacing preservatives. This work will be under the direction of this department.

You are earnestly requested to be present and cooperate in making this convention as successful as possible.

FREDERICK SKENE,
State Engineer and Surveyor.

Robert P. Hooper, Chairman of the A. A. A. Good Roads Committee, has requested similar letters to be sent out by the State highway commissioners of Michigan, New Jersey, Illinois and Massachusetts.

The speakers at the convention and their subjects will be: James H. McDonald, president American Road Makers, Hartford, Conn., "Construction of Macadam Roads"; Frederick Skene, State engineer and surveyor of New York, "History and Development of Improved Highways"; W. E. McClintock, highway commissioner, Massachusetts, "Repair and Maintenance of Macadam Roads"; Joseph W. Hunter, highway commissioner, Pennsylvania, "Road Materials"; A. N. Johnson, State engineer, Springfield, Ill., "Road Problem in the State of Illinois"; P. A. Hooker, supervisor of public roads, New Jersey, "Surfacing of Macadam Roads"; Horatio S. Earle, State highway commissioner, Detroit, Mich., "Drainage and Sub-base of Improved Roads"; L. W. Page, U. S. Department of Agriculture, Washington, D. C., "Effect of Automobiles on Macadam Roads, and Question of Preservation Under New Conditions"; D. Ward King, Missouri State Board of Agriculture, Maitland, Mo., "Treatment of Earth Roads"; Stephen Ryan, State Road Director, New York, "Improvement of Town Roads."

Other speakers, whose subjects are yet to be announced, are: Ex-Governor Batchelder, of New Hampshire, president of the National Grange; Aaron Jones, master of Indiana State Grange, Indiana; F. A. Derthick, master of Ohio State Grange, Ohio; F. N. Godfrey, master of New York State Grange; Jothan P. Allds, senator, Highway Code, Norwich, N. Y.; R. B. Boman, deputy State highway commissioner, Pennsylvania.

WHY EUROPE MISUNDERSTANDS RACING SITUATION

PARIS, June 10.—It is impossible to give a better idea of the gross ignorance of automobile Europe regarding American matters than by a textual translation of a portion of an article published in the semi-official organ of the Automobile Club of France. It reads as follows:

When the American Automobile Association sent its regulations for the Vanderbilt Cup we noted that they in no way conformed to those adopted at Ostend by the Federation of National Automobile Clubs. A few days later M. René de Knyff, president of the Sporting Commission of the Automobile Club of France, wrote a letter of protestation to the president of the Automobile Club of America. This letter was addressed to the A. C. A., the only automobile controlling power in America recognized by the A. C. of France.

The Automobile Club of America then requested the A. A. A. to adopt the Ostend regulations for its race. The A. A. A. refusing to give satisfaction to the Automobile Club of America, the club purely and simply disqualified the event and telegraphed this decision to all the clubs of the Federation asking that they should give their support. Each telegram was reply paid to the extent of 150 words.

Having information of this nature, it is not surprising that the Sporting Commission of the Automobile Club of France, at its special meeting this week, should have been of the opinion that the only course open for it was to support the Automobile Club of America, and, like that body, disqualify the Vanderbilt Cup.

In French eyes the matter is simplicity itself. The A. C. F. is under the impression that the Automobile Club of America is a body in every respect similar to itself. As everybody knows, the French Club is undoubtedly the club of France; its officers and leaders are the heads of such firms as Panhard, Renault, Brasier, Darracq, Dietrich, Bayard-Clément, Mors, Delaunay-Belleville, etc. The entire automobile industry of France is represented in the Automobile Club of France; there is no opposition; other bodies have been formed for specialized work, or are provincial clubs occupied entirely with local affairs.

It is no exaggeration to say that nine-tenths of the directors

of the Automobile Club of France are under the impression that a similar condition exists in the United States, and that the Automobile Club of America is its counterpart in the western republic. No other explanation is possible for its recent action in connection with the Vanderbilt Cup rules. So convinced are they that they are right that this recent decision to boycott the Vanderbilt and support the Grand Prix of America, which the A. C. A. may put on foot, has been communicated to all European bodies and their support earnestly solicited.

M. René de Knyff, president of the Racing Board of the A. C. F., is reported to have declared that he was very well pleased with the decision. "The Automobile Club of America is the only official organization in the United States and we are bound to support it in the attitude it has assumed towards the Automobile Association, which has flagrantly ignored the rules of the Ostend conference in promoting a contest not in accord with the agreements then made."

Count Adalbert Sierstorpf, the German representative, states that his club has written all German automobile manufacturers, advising them not to enter for the Vanderbilt Cup contest.

Doubtless the only way to straighten out the difficulty would be for the American Automobile Association to send a deputation to the international conference to be held at Dieppe during the French Grand Prix. At this meeting, which will be attended by delegates from all the European national clubs as well as the Paris representative of the A. C. A., the question will be fully discussed and no doubt an attempt made to get the international federation to vote in favor of the boycotting of the Vanderbilt contest. It being impossible to doubt the value of uniform rules for all great automobile races, and the European bodies as a whole being ill-informed on this matter, there is every possibility of the French boycott becoming a European boycott. The only way to prevent this would be for the American Automobile Association to put its side of the case before the conference. Europe needs educating.

NEW YORK CLUB NAMES DATE FOR ITS EUROPEAN RACE

THE Automobile Club of America has announced Thanksgiving Day, November 26, 1908, as the date of the race it proposes to run at Savannah under European rules. Not more than three cars of any one make will be eligible to compete. Although there has been no limit set to the number of cars eligible to compete, the club's contest committee reserves the right to run eliminations, if necessary. As the club is understood to have guaranteed the Savannah club a minimum of at least twenty foreign entries, if its guarantee be made good, there is a chance that this condition may arise.

The entry fees are as follows: \$750 for one car; \$1,300 for two cars of the same make; \$1,750 for three cars of the same make—thus providing \$750 as the fee for the first car, \$550 as the fee for the second car, and \$450 as the fee for the third car when a maker enters a full team of three machines. A deposit of \$300 per car must accompany each entry when the blank is filed with the committee.

Entries will close October 1, at regular fees, but additional entries will be accepted up to November 1, upon payment of an extra fee of \$250 per car.

The limitations of weight and cylinder volume set forth in the club's official announcement follow, of course, strictly the European rules, which call for a bore of 6.1 inches (155 millimeters) maximum for four-cylinder cars, or the equivalent in an effective surface, or 75.4678 square millimeters for machines otherwise cylindered, and a minimum weight of 2,424 pounds (1,100 kilos) including oil for the motors and transmission.

Coincident with the announcement of the date and conditions of the race was an appended statement that the Acme Motor Car Company had wired for an entry blank and would enter a car in the race. H. S. Sternbergh, president of the company,

'phoned a New York representative that his company had sent no such telegram and had reached no such decision.

"A great mistake has been made in this matter," said he. "No telegram of this character or anything which could be interpreted as signifying the intention of this company to enter, at this time, the Grand Prize race, has been sent by me to the Automobile Club of America. I have investigated the matter this morning and can find no official or employee of this company at the factory who has sent such a telegram. I have asked the Automobile Club to explain to whom the telegram was sent and how it was signed and when sent."

Subsequently it transpired that J. C. Finney, the company's Savannah agent, had bespoken a number in the race. Learning this, Mr. Sternbergh wired: "We learned this morning from our Mr. Finney, in Savannah, Ga., that he had entered one of his cars in some race or other to be held at Savannah. We do not know what race, nor when. Of course we, as the Acme Motor Car Company, have nothing to do with this entry."

Arthur W. Solomon, secretary of the Savannah Automobile Club, who has been in New York this week in consultation with the local club's officials and contest committee, made public the fact that on June 5 the club's resignation had been forwarded to President Hotchkiss and its receipt acknowledged. At the same time the resignations of Frank C. Battey from the Racing Board and Arthur W. Solomon from the Touring Board were also forwarded. These resignations were, of course, to be expected in view of the club's decision to cast its racing lot with the New York club. As the resignations had not yet been acted upon, Secretary Elliott, of the A. A. A., did not, of course, make public the fact that they had been handed in, but it is anticipated that this will be announced within a few days.

A. A. TOUR WILL BE A TRIUMPHAL RUN.

Participants in the annual A. A. A. tour, which will embrace contests for the Glidden and Hower trophies, according to reports received at the Touring Board headquarters in Buffalo, are justified in anticipating the same triumphal passage as has always characterized their reception along the route of the run.

Chairman F. B. Hower reports that the number of entries to date is the same as at the same time last year, although the definite assurances from manufacturers indicate a larger entry than last July. Mr. Hower says he cannot understand why the participants do not take advantage of getting a low numeral by entering early instead of waiting till the last week as they usually do. Entries for the tour close July 3 with F. B. Hower, 760 Main street, Buffalo, N. Y. The entries to date are:

For Glidden Trophy—No. 1, Charles Clifton, Great Arrow; No. 2, Charles Clifton, Great Arrow; No. 3, J. W. Maguire, Great Arrow; No. 4, R. M. Owen, Reo; No. 5, E. H. Parkhurst, Peerless; No. 6, E. H. Parkhurst, Peerless; No. 7, E. H. Parkhurst, Peerless; No. 8, R. M. Owen, Premier; No. 9, R. M. Owen, Premier; No. 11, Gus G. Buse, Thomas.

For Hower Trophy—No. 100, R. D. Garden, Great Arrow; No. 101, R. M. Owen, Reo; No. 102, W. H. Vandervoort, Moline; No. 103, Charles Clifton, Great Arrow; No. 104, Henry Johnson, Premier.

For Certificate—No. 10, Paul Gaeth, Gaeth.

Non-Contestants—No. 18, R. M. Owen, Premier Pilot Car; No. 99, Charles Clifton, Great Arrow, Chairman's car.

TO HAVE A BALLOON PARK AT WORCESTER.

WORCESTER, MASS., June 15.—J. P. Coughlin, president of the Worcester Automobile Club and a member of the New England Aero Club, announced last Saturday that Charles J. Glidden of Boston, the famous globe-encircling automobilist and vice-president of the Aero Club, was negotiating with him to at once establish in Worcester a park for balloon ascensions.

REEVES LOOKING FOR CHICAGO SHOW PLACE.

CHICAGO, June 11.—Alfred Reeves, general manager of the American Motor Car Manufacturers Association, passed two days in Chicago this week canvassing the situation as regards the holding of an independent show in this city next winter. The A. M. C. M. A. had had some correspondence with the two local organizations, the Chicago Automobile Club and the Chicago Motor Club, relative to the two bodies assisting the dealers in the promotion of the affair and it was with the idea of looking over the available buildings that Mr. Reeves came to Chicago. While here he conferred with representatives of each club and also looked at the two buildings under consideration—the new Seventh regiment armory and the Dexter park pavilion at the stockyards. The former building, he thought, was too small for the purpose, while he changed his mind regarding the stockyards proposition when he found that the elevated express service could land people at the doors in 18 minutes from downtown. The pavilion has 20,000 square feet more than either the Madison Square Garden or Grand Central Palace, and Reeves greatly fancied it. However, no final action will be taken in the matter until the next meeting of the show committee of the A. M. C. M. A., which will be held late this month or early in July.

SCRIBES AND SALESMEN TO CROSS BATS.

A feature of the annual reunion of Oldsmobilists, which is to be promoted on Saturday at the Columbia Oval Cricket Club grounds by General John T. Cutting, the head of the Olds Motor Works' New York agency, will be a baseball game between a nine made up of metropolitan automobile writers and a team of the agency's employees. Oldsmobile owners, candidates for the car to be drawn for by lot, will parade to the Oval, starting from Broadway and Fifty-first street at noon.

MANY THINGS THAT THE CLUBS ARE DOING

BAY STATE CLUB MOVES TO THE CARLTON.

BOSTON, June 16.—The Bay State Automobile Association is shortly to move into new quarters in the Carlton Hotel in upper Boylston street. On the first of next month the clubhouse which has been occupied for several years on Dartmouth street will be vacated and the club will move to the Carlton, where a commodious and handsomely furnished suite of rooms is being prepared. The clubhouse has proved rather larger than was needed and the expense of maintaining a restaurant has been excessive. At the hotel the club will have the benefit of the hotel's restaurant and service facilities and yet will be as exclusive as in a separate house. The suite of rooms is large enough to provide for all the comforts and conveniences that are now enjoyed, and the location is excellent, the hotel being situated very near the automobile trade district and at the very entrance to Boston's splendid park system.

ACTIVITIES OF THE CHICAGO AUTO CLUB.

CHICAGO, June 15.—Autoists here have found it impossible to revive interest in the once popular social tour. This became evident last week when Chairman A. J. Banta of the runs and tours committee of the Chicago Automobile Club called off the run to the Hotel Moraine, Highland Park, scheduled for Saturday, June 6. Mr. Banta had high hopes at the beginning of the season that this would prove popular again this year and planned several attractions. However, notices sent to members regarding the Highland Park run went practically unheeded and as a result it was called off. One run will probably be held during this summer. This is the tour contemplated to Gary, Ind., the new town of the United States Steel Corporation. This run will probably prove a drawing card as it has as attractive features a visit to the steel plant and a road ability contest.

NEW HAMPSHIRE AUTOISTS BEGIN WELL.

KEENE, N. H., June 15.—To signalize its recent successful organization, the Cheshire County Automobile Association held its first annual meeting and banquet in Wildey Hall, upwards of fifty members, beside guests, being in attendance. Dr. I. J. Prouty is the president of the newly-formed club; D. W. Goodnow, vice-president; F. J. Bennett, treasurer; F. A. Wright, secretary, while the directorate is composed of Dr. J. B. Hyland, J. A. Toof and D. W. Goodnow. The organization started off with a charter membership of 40, but its list is rapidly on the increase. Every autoist in the county must be enrolled.

JERSEY CLUB FIGHTS NEW BRUNSWICK JUSTICE.

NEWARK, N. J., June 15.—Driven to desperation by the contemptible attitude of the authorities of the town of New Brunswick and of Justice of the Peace W. A. Housell in particular, the New Jersey Automobile and Motor Club has decided to undertake a campaign against both New Brunswick and its prejudiced "J. P." Two motorcycle scouts will be posted at each end of Housell's special trap to warn all comers of their danger, as it has been found that men on foot could not accomplish the purpose effectively. In addition to the man assigned to the trap, a third will be stationed at the justice's office to keep tab on the fines and to inform the victims that they can go before any other justice and be assured of fair play. The plan also includes the stationing of a man at the Tottenville ferry from Staten Island to urge all autoists crossing there to cross the bridge and pass through South Amboy to Old Bridge, the roads in that direction being fully as good as those via New Brunswick, as this diversion of traffic will rouse the interest of hotel keepers to what is going on. The club will endeavor to have another "J. P." sitting in the vicinity of Housell's office.

TEN-MILE TRACK IN PROSPECT AT BRIDGEPORT.

BRIDGEPORT, CONN., June 15.—Headed by T. H. MacDonald and Bernard Setzer, a number of the leading members of the Automobile Club of Bridgeport have been inspecting the tract of land owned by the Lordship Park Association with a view to its purchase for the construction of a ten-mile circuit on which auto road races could be safely held. The interest in automobile racing here was evidenced by the fact that 10,000 people turned out to see the Sport hill-climb. The land in question is all marsh so that in building the road it could be easily flanked on either side by a moat which would constitute effective protection for the spectators, while the lay of the land is such that every mile of the course can be seen from a natural elevation on which a grandstand could be erected. It is estimated that the road could be built for \$50,000.

GENEVA HOLDS ANNUAL "OFFICIAL'S RUN."

GENEVA, N. Y., June 15.—The Geneva Automobile Club has instituted a custom of holding an annual run on the occasion of which the heads of the local government, the police, a number of prominent citizens and the representatives of the press are invited to participate in a 50-mile drive as guests of the club, and this year's celebration of the event was held June 5.

Scene at the Long Island Automobile Country Clubhouse, Bay Shore, L. I., on the Occasion of the Formal Opening.

There were 30 cars, carrying no less than 110 of the flower of Gencva's citizenship, and the run to Victor, N. Y., was made under ideal weather conditions. Though not a speed or endurance contest, a prize was offered to the driver of the car who adhered most closely to the schedule of one hour and twenty-five minutes for the distance. This was won by Dr. W. H. Jordan, whose car bore the unlucky number 13, the latter having been refused by a number of the contestants. The run was a most enjoyable affair and its holding is responsible for a most cordial feeling between autoists and the authorities during the remainder of the year, so that the custom is one that could well be followed elsewhere.

CONNECTICUT'S BODY GAINS RECRUITS.

HARTFORD, CONN., June 15.—W. F. Fuller, president, and G. K. Dustin, secretary, presided at a meeting of the Connecticut State Automobile Association, held at the Atlantic Hotel, Bridgeport, recently. Various standing committees for the season were named, and the newly-formed Rockville Automobile Club was formally admitted to membership. The association is adverse to speeding, and will do all in its power to discourage careless and reckless operation.

The New Britain motorists favor consolidation of their club with the Automobile Club of Hartford. The membership of the New Britain club is under 40, but there is plenty of funds in the treasury. It has not been definitely decided whether or not the smaller organization will be taken over by the larger. The former is not active. Mayor Landers, who is a member of the club, has just renewed his membership with the Hartford club.

ROCHESTER CLUB'S BUFFALO DELEGATES.

ROCHESTER, N. Y., June 15.—The delegates from the Rochester Automobile Club to the A. A. A. good roads convention at Buffalo in July will be President Henry G. Strong, Vice-president Wm. C. Barry, Jr., F. E. Mason, John W. Breyfogle, W. H. Campbell and Secretary Bert Van Tuyle. The club will hold a club run to Buffalo at that time which will be run in three sections, the first starting Monday, July 6, for an evening run; the second, Tuesday morning, and the last, Wednesday morning. It is expected that at least 150 cars will participate. The club's headquarters will be at the Lafayette Hotel.

NEW YORK CLUB'S TOUR STARTS FRIDAY.

The Automobile Club of America's pleasure tour of New England, which is planned to last nine days and embrace in its itinerary Poland Springs, Me., and Bretton Woods in the White Mountains, is scheduled to start on Friday of this week. The cars will be divided into three classes, each running on a separate time schedule as follows: Class 1, under 20 horsepower, 14 miles per hour; class 2, 20 to 40 horsepower, 18 miles; class 3, above 40 horsepower, 20 miles. Last Saturday it was announced that 15 cars had been entered, but the names of the entrants were withheld.

ROCHESTER CLUB'S SEVEN-DAY RUN POSTPONED.

ROCHESTER, N. Y., June 15.—Owing to the amount of business that is being done at present by the local dealers and manufacturers, it has been decided to postpone the holding of the seven-day endurance run planned by the Rochester Automobile Club, until later in the season, as it would be difficult for the business interests of automobile "row" in this city to spare a sufficient number of cars and men for an entire week just at this time.

SIoux CITIZENS ARE FORMING A CLUB.

SIoux CITY, IA., June 13.—An automobile club is in process of formation in this city. A club was in existence here three years ago but, owing to the small number of machines then owned in this city, it was not a success. Since then the number of cars has increased threefold.

BIG RUNS PLANNED TO WILDWOOD RACE MEET.

WILDWOOD, N. J., June 16.—The Motor Club of Wildwood is arranging for runs from New York and Philadelphia to its race meet on July 4. On Friday, the day before the races, the Quaker City delegation will start from Gloucester at 1 P.M. and the New York contingent from Jersey City at 7 A.M. It has been arranged for both runs to meet at Egg Harbor and continue together.

JERSEY'S BIG CLUB TO MOVE ON JULY 1.

NEWARK, N. J., June 16.—On July 1 the New Jersey Automobile and Motor Club will move from its former home on Broad and Chestnut streets to new quarters now being fitted up in the University Club Building, East Park street and Park place.

MUTUAL FORBEARANCE BEARING EXCELLENT FRUIT

PHILADELPHIA, June 15.—Continuing its work of breaking down the mutual feeling of enmity existing between township authorities in Montgomery county and automobilists generally, the Automobile Club of Philadelphia in its latest bulletin says:

The club has received complaints from the Lower Gwynedd township authorities in regard to the manner in which automobiles are driven at the crossings of the Bethlehem, Sumneytown, and Penllyn pikes at Springhouse in Lower Gwynedd township. The feeling in the township is not against the speed at which the automobiles are driven on straight stretches of road with no crossings. The complaints are that drivers do not give half of the road to the teams and do not slacken speed at this crossing which is conceded to be dangerous. There are now no traps in this section. We ask the assistance and cooperation of every automobile driver in Philadelphia, and we request you to bring this to the attention of your chauffeur, if you do not drive yourself. If complaints of this character can be met by inducing motorists to comply with reasonable requirements with resort on the part of the authority to legal proceedings it will be very much to the advantage of all motorists in this part of the State.

The method of mutual forbearance, instead of the chip-on-the-shoulder attitude which formerly obtained is already bearing fruit in more reasonable regulations in the various boroughs and townships, and it is the policy of the club to hold on to everything in the way of a concession it can lay hands on.

Just at present the law committee has under consideration the

recent recrudescence of the "hold-up" habit in Cheltenham and Abington townships, which the Automobile Club of Philadelphia was instrumental in putting a stop to some years ago. It has been noticed that the stoppages of cars becomes more numerous with the opening of the season at Willow Grove. It is a well-known fact that upon the close of each night's concert, there is a rush for the city, and many impromptu races are pulled off. The club is and always has been opposed to the use of the roads for speeding purposes, and will do everything in its power to put a stop to the practice.

Chief Lever, of Abington, and Chief Lindsay, of Cheltenham, have both been doing a land office business, and within the past month the former's arrests have netted the township's treasury something like \$600 in fines. And this despite the comparative lenient treatment now in vogue. The authorities give automobilists a margin of five miles an hour on the 20-mile-an-hour stretches, and something more on the 10-mile-an-hour stretches; when they exceed the increased limit an arrest is in order.

Many of the drivers cannot be stopped, but their numbers are taken and they are communicated with and ordered to appear for a hearing. Some of them obey, and get off easy; others send the full amount of the fine; still others ignore the summons. The latter come up double or better when apprehended.

Vice-President Fairbanks Leads Indianapolis Parade.

Parentless Little Ones of Chicago in a Tincher.

HOW ORPHANS' DAY WAS CELEBRATED IN MANY CITIES

INDIANAPOLIS, IND., June 15.—Under the auspices of the Indianapolis Automobile Trade Association, 168 orphans of the city were given an automobile ride and outing last Wednesday afternoon. Among those who joined in the effort to make the youngsters happy were Vice-president Charles W. Fairbanks, Mayor Charles A. Bookwalter, Judge G. W. Stubbs of the Juvenile Court, Robert Metzger, chief of police, and several individual automobile owners.

There were almost fifty automobiles loaned by members of the association, manufacturers and private owners, that gathered at the foot of the Soldiers' and Sailors' Monument early in the afternoon. Each automobile was numbered and each youngster wore a tag bearing the number of the automobile.

Although an extremely busy man, Vice-president Fairbanks gladly consented to accompany the party as far as Thirty-eighth and Meridian streets, riding in a National roadster driven by Frank L. Moore of the Fisher Auto Company, and leading the long parade. Mayor Charles A. Bookwalter rode in a Premier as the guest of R. I. Eads of that company; Judge Stubbs of the Juvenile Court was the guest of P. D. Stubbs of the Overland Automobile Company, who drove an Overland, and Chief Metzger rode with Frank Staley of the H. T. Hearsey Vehicle Company in a White steamer. Four police officers rode in the car the Premier Motor Manufacturing Company is driving 100 miles a day for 100 days.

The children who were guests of the association came from the Indianapolis Orphans' Home, the German General Protestant Orphan Asylum and the Jewish Orphans' Home of this city and from the home of the Pentecost Band at Bridgeport, the children from that city coming to Indianapolis on a traction car.

the automobile association paying their fares. Following a ride of several miles, the youngsters were turned loose in White City, an amusement park north of the city, where all attractions were free to them.

AGED TOO ON CHICAGO ORPHANS' DAY RUN.

CHICAGO, June 13.—The local celebration of orphans' day, which took place yesterday, with the three organizations, the Chicago Automobile Club, the Chicago Automobile Trade Association and the Chicago Motor Club, promoting the affair, was the greatest success this city has recorded in the three years it has been following the custom of giving the youngsters a free ride.

More than 175 cars were in line, and more than 1,300 participated. Departing from the usual custom, the promoters of the affair this time included the old people, an innovation which proved most popular, for it brought out many aged persons who never before had ridden in motor cars and some of them never had seen the full extent of the city's boulevard system. Sixteen institutions were represented and it is believed that no one was overlooked by the joint committee, at the head of which was Joseph F. Gunther, ex-president of the trade association.

It was believed by this committee that the children and young people would enjoy a long ride more than they would going to some amusement park for the afternoon, so this latter feature was cut out and instead a ride around the park system substituted. This in itself made a long jaunt, a 40-mile ride, and still not taking in all the roads under the supervision of the three park commissions.

Before the start each person was provided with an American

Blind Children Who Were Guests of the Boston Automobile Dealers' Association, on Way to Sharon.

flag and a bag of peanuts and candy and soon the smooth pavement was littered with peanut shucks, for the kids did not wait for the parade to start before tackling the bags. The 40-mile run took three hours.

BOSTON ORPHANS HAVE ANNUAL OUTING.

BOSTON, June 15.—The annual outing for blind children of Boston, given by the Boston Automobile Dealers' Association, took place last Thursday, and nearly one hundred and fifty little boys and girls, happy despite their affliction, were the guests of the local trade members in a trip to the town of Sharon, a beautiful country place about fifteen miles south of this city. In entertaining the little ones, about half of whom came from the Perkins Institution for the Blind in South Boston, and the other half from the Kindergarten for the Blind in Jamaica Plain, the dealers were assisted by Dr. M. R. Deming, superintendent of the Lake Shore home, a charitable institution located on Lake Massapoag in Sharon. The outing was in general charge of Chester I. Campbell, secretary of the dealers' association, and about thirty agents and managers supplied machines, several of them driving cars themselves so as to insure a safe journey for the youngsters.

The run to Sharon was made during the forenoon and, arriving at the Lake Shore home, the youngsters were let loose to enjoy themselves, teachers and the automobile men being on the watch to see that they did not harm themselves. At noon a substantial lunch was served at the home and afterwards there were boat rides, a concert and other amusements. The trip home was begun at about 4:30 o'clock.

HARTFORD CLUB OBSERVES ORPHANS' DAY.

HARTFORD, CONN., June 13.—The Orphans' Day run of the Automobile Club of Hartford, which was held this afternoon, was a complete success. About 200 children participated. They were carried in 45 cars donated by members of the club. The run was continued to Manchester Center, thence home by way of the north road, where a stop was made at Laurel Park, about six miles from Hartford. The cars were packed within the gates of the reservation and the little ones made for the park proper and the fun was soon at its height. Each child was provided with a substantial lunch. It was a sight to watch the youngsters get away with that lunch, and those who supposed that the parentless ones possessed no table manners were disappointed. As soon as one table was vacated another squad marched in good order and took possession. A stop of about an hour and a half was made at the park, during which time the youngsters took in all the sights of the park and let loose for a good time. When all the little ones had been fed and had had a good time start for home was made.

J. D. Anderson, president of the Hartford Rubber Works, drove his own Thomas Flyer and carried a large number of the little ones. C. D. Rice, another active club member, likewise a busy man, gave up his time to make the affair a success.

The committee in charge was Albert M. Kohn, chairman; C. D. Alton, Jr., W. C. Russell, A. G. Hineckley, C. H. Gillette and H. W. Nuckols.

QUAKER CITY ORPHANS VISIT WILLOW GROVE.

PHILADELPHIA, June 15.—A clear sky and the pleasantest of June weather but served to accentuate the paucity of vehicles last Wednesday, when the Quaker City Motor Club gave the orphans of the city their annual outing to Willow Grove park. Just seventy-two automobiles—touring cars, runabouts and motor trucks—showed up at the Hotel Walton and were assigned to various homes in as many sections of the city. By judicious squeezing and crowding about 900 little ones—boys and girls, black and white, crippled and whole—with their caretakers, were stowed away, more or less comfortably, and whirled away through the green lanes and country roads to that seventh heaven of

juvenile delight, Willow Grove, with its endless amusements. Arrived there, the guests were met by the committeemen and supplied with one or more—usually more—strips of admission tickets to the various attractions which add to the natural charms of the park. The committee which managed the affair consisted of Edwin H. Lewis, chairman; George W. Daley, secretary; George H. Smith, Charles J. Swain, Herbert E. Landell, Richard Sellers and Archie E. Hughes.

MONUMENTAL CITY'S OUTPOURING WAS BIG.

BALTIMORE, June 15.—Nearly 1,000 orphans were the guests of the Automobile Club of Maryland, last Wednesday, the occasion being the fourth annual outing for orphans. More than 200 cars, contributed by owners and dealers in this city, were in the line of parade which started from in front of the club's headquarters, Mount Royal avenue and Charles street. The cars were prettily decorated with flags, bunting and color schemes. When the bugle sounded for the start of the parade a loud cheer went up from the little ones, who were radiant with joy. An interesting route was arranged for the ride to Electric Park, where the guests were given supper, ice cream cones and cake. After this they were taken to the various amusements on the ground, including the Wild West and vaudeville shows. Four of the cars carried O. P. Steinwald's Band, which rendered music for the occasion. C. Howard Millikin and Dr. H. M. Rowe had charge of the arrangements.

MICHIGAN AUTOISTS REMEMBER THE ORPHANS.

GRAND RAPIDS, MICH., June 15.—Members of the Grand Rapids Automobile Club responded liberally to the call for cars to give the orphans their annual treat, and as a result several hundred of the little ones were entertained in a manner that they will long remember. The run was to Plainfield along the Grand river, a stop being made on the return drive at North Park, where lunch was served and the children amused by the various delights of the picnic ground. Automobiles have been kept busy entertaining for the whole week, a part of the official entertainment of the Merchants' Week visitors being a trip round the city in autos, while the Michigan Masons' convention was similarly treated.

PEORIA "GLIDE" CLUB HAS AN ORPHANS' DAY.

PEORIA, ILL., June 15.—This is the home of the manufacturers of the Glide cars, and owners of machines of this make have formed the Glide Club, which is a very flourishing automobile organization. The club observed the annual celebration of Orphans' Day by taking the children and their nurses from the Home of the Friendless for an outing, June 10.

THOMAS GAINS ON PROTOS IN SIBERIA.

After having been unheard of for fully a week or more, the round-the-world racers suddenly bobbed into view at Chita, the Protos' arrival there gaining the Germans the \$1,000 prize offered by the Siberian Railway. According to the *Times'* advices, the Thomas was only 20 miles east of Chita on June 16, having made up three of the five days' lead of the Protos caused by the breaking of a chain. The Zust is more than 1,000 miles behind and is said to be wrecked. Chita is 1,402 miles from Vladivostok.

CONTINENTAL TO HOLD READY-FLATED CONTEST

Prizes of \$10 for first and \$5 for second are held up by the Continental Caoutchouc Company, to chauffeurs or others, who can replace a punctured tire with a "ready-flated" Continental in the shortest time. The contest will be held at the Continental headquarters, Broadway and Fifty-eighth street, Friday, June 26. Three trials will be allowed, time being taken with stop watches. The prizes will be paid in gold.

SHANKS LEAVES WINTON TO TAKE CHALMERS.

CLEVELAND, O., June 15.—The resignation of Charles B. Shanks from the Winton Motor Carriage Company, and his announced intention of handling the Chalmers-New-Detroit in Cleveland and Northern Ohio has stirred the trade in this city as it has not been affected for many months. No one ever conceived the idea that Shanks and the Winton Company could be separated; had such an idea developed Shanks would surely have been offered sales managerships galore, for there is not a better known man in the trade.

"Just one reason prompted the change," said Mr. Shanks in talking over the shift yesterday. "Sooner or later every young man who considers himself in the 'live class' ought to get into business for himself, and in leaving my desk and taking on the agency for the Chalmers, I am merely following out an idea which I have been considering for a long time. I have only been waiting for the right proposition, and I am confident that I have found it."

In 1899 Shanks left the Cleveland *Plain Dealer* to become Winton advertising manager. In 1902 he was chosen to manage the Winton Company's new Cleveland branch, and the following year he was given complete charge of the company's large national selling organization, extending from coast to coast. His new salesrooms will be located on Euclid avenue in the heart of "auto row," and will be a very welcome addition. Mr. Shanks is very enthusiastic over his new work, and has made arrangements to cover northern Ohio very carefully. He will have at least three men working under him, and expects to do a large State as well as city business.

E. V. PLANT MAY SUSPEND OPERATIONS.

HARTFORD, CONN., June 15.—There is a general impression prevalent that July 1 will mark the closing of the manufacturing department of the Electric Vehicle Company's plant, only the repair end being maintained after that date. Should such prove to be the case, it will be a distinct disappointment to Hartford interests, as it has been hoped all along that the company would continue in some form. The failure of the Packard negotiations for the purchase of the plant was particularly regretted, and the present status of the defunct concern's affairs is a riddle that no one appears to be able to solve. Since the resumption of manufacturing a few weeks ago, close to 100 of the 28-horsepower Columbia cars have been marketed, and by substituting a sliding gear-set for the electric transmission, all the material purchased for the gasoline-electric car could be utilized. The receivers' report for May shows the cash receipts to the end of that month to be \$156,618.06, and the expenditures \$36,513.85, leaving a balance in hand of \$120,104.21.

CHURCHILL BECOMES WINTON SALES MANAGER.

Charles W. Churchill, who since 1906 has been manager of the New York branch of the Winton Motor Carriage Company, has been appointed general sales manager of that concern, with headquarters at Cleveland, to succeed Charles B. Shanks, who resigned that position a few days ago to engage in business for

Chas. W. Churchill.

Chas. W. Mears.

himself. Mr. Churchill has been associated with the Winton Company for a number of years and was assistant manager of the Cleveland branch before receiving the New York appointment, so that the change will be merely a return to the old territory so far as going to Cleveland is concerned.

Mears Becomes the Winton Advertising Manager.

Charles W. Mears, for four years past assistant manager to Mr. Shanks, has been appointed advertising manager for the Winton Company. Mr. Mears has had a number of years' experience in newspaper and publicity work, having been at one time the editor of the *Motor Vehicle Review*, now THE AUTOMOBILE. He showed his mettle as a publicity expert by winning the Arbuckle advertising contest which carried with it a prize of several thousand dollars.

A MAXWELL-BRISCOE-BUICK COMBINATION.

Negotiations for a consolidation of the Maxwell-Briscoe Motor Car Company and the Buick Motor Car Company are still in progress. It is said that the two other makers of small cars reported to have been invited to join the combination have decided to continue business independently, and at the present moment nothing definite concerning the progress of the negotiations for the consolidation of the plants of the two large makers of low-priced cars has been made public.

Licensed Engineers on Top of the Winton Plant at Cleveland on the Occasion of Their Recent Visit.

On the occasion of their recent meeting at Cleveland, the engineers of the Mechanical Branch of the Association of Licensed Automobile Engineers made a visit of inspection to the plant of the Winton Motor Carriage Company, and a group of them are shown on the roof of one of the buildings of the factory.

Pennsylvania Rubber Company's New Tire Ambulance.

LATEST AUTO AMBULANCE IS FOR AUTOISTS.

BUFFALO, June 15.—There have been automobile ambulances of numerous different kinds brought out within the last year or two, but the autoist's interest in them has been purely academic. C. S. Pelton, manager of the Buffalo branch of the Pennsylvania Rubber Company, Jeannette, Pa., conceived the idea of a tire ambulance to play Good Samaritan to the many autoists who come to grief on Sundays and holidays and has executed it in the ingenious manner shown by the accompanying photograph. A light automobile delivery wagon has been secured and equipped with all sizes of Pennsylvania shoes, tubes and the like, as well as a complete supply of cement, patches and other necessaries, while a Prest-O-Tire tank is carried to make the work of re-inflating the repaired tires easy. The car will run up and down the main traveled roads for a number of miles out of the city on Sundays and holidays and the aid thus offered will doubtless be found very welcome by many an autoist who would otherwise be stranded. During the first few days the experiment has been found to work even better than its originators had expected would be the case, so that doubtless the Pennsylvania ambulance will become a permanent fixture.

DRINK TO PULLMAN'S NEW YORK SUCCESS.

An innovation in trade dinner giving was sprung at Reisenwebers' last Friday evening, when Cimiotti Bros., New York agents for the Pullman, invited their friends of the factory and the press to join with them in celebrating the sale of the last of the 1908 cars allotted to the metropolitan agency. It was a radical departure from the usual banquet, which often has as its real object the acceleration of the transfer of cars from the store to the customer.

Sales Manager O'Connor and Treasurer Stevenson came on from the Pullman plant to assist in the jollification and a dozen automobile press men were also among the celebrants.

Major Humphrey, on behalf of the Cimiotti "big three"—Ferdinand, W. C., and Paul—pictured in his choicest Shakespeare the triumph of the Pullman, and as toastmaster inspired the guests to lofty flights of post-prandial oratory. Among those to respond were: Ferdinand Cimiotti, J. P. O'Connor, Augustus Stevenson, W. H. Horner, L. C. Howell, C. G. Percival, W. W. Lee, E. A. Ward, H. F. Donaldson, Russell A. Field, E. E. Schwarzkopf, W. J. Morgan, Alex Schwalbach, F. W. McAllister and Louis R. Smith.

PEERLESS BRINGS OUT A CLOSE-COUPLED BODY.

One of the latest additions to the Peerless line of special models is the close-coupled touring body shown by the accompanying photograph, this type of car being designed for the use of those who desire more accommodation than is afforded by the usual runabout type with its rumble seat, but do not wish to be burdened with the weight of the regular touring type of body. The

Engineer Schmidt at the Wheel of a New Peerless.

photograph shows Charles Schmidt, chief engineer of the Peerless company, at the wheel, Mr. Schmidt trying out the car after his recent return from abroad. E. H. Parkhurst, vice-president of the company, is seated beside Mr. Schmidt and H. E. Foote, the company's publicity manager, is in the tonneau.

MOON BRINGS OUT A NEW ROADSTER TYPE.

Owing to the strong demand that has existed for what may best be termed a "handy car" last season, and which is more in evidence than ever this year, the makers of the Moon cars, the Moon Motor Car Company, St. Louis, Mo., have just added to their line the neat and business-like roadster type shown by the accompanying photograph. So far as looks go, the car is able to speak for itself better than any description, its lines and whole appearance being unusually trim and racy looking, while the double rumble seat in the rear gives it capacity for accommodating four passengers, and the two who are on the rear seats need not be as uncomfortable as is the usual lot of the "man behind" owing to the easy riding full elliptic springs with which the car is equipped. The use of a much smaller tire forward adds much to the neat appearance of the car and also facilitates steering, the equipment being 36 by 3 1-2 front and 4 1-2 rear.

Neat and Attractive Lines of the New Moon Roadster.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Another achievement was shared in by Pennsylvania Tires when O. F. Alcott, driving his six-cylinder Stearns with this tire equipment, won each of the three races for six cylinder cars, all in which he entered at the Jamaica Automobile meet.

The phenomenal growth of its business has necessitated the removal of the Penn Automobile Supply Company from the basement of 301 North Broad street, Philadelphia, to 236 North Broad street, where the entire building will be occupied.

In the report of Cedrino's death at Baltimore, it was stated that the accident was due to the right front tire giving way, but the wheels of the car when received by the Continental Caoutchouc Company showed that none of the tires had collapsed and all were still firmly attached to the rims.

The \$2,500 contest for Winton Six-Teen-Six chauffeurs will end June 30 and the prizes will be awarded as soon thereafter as complete reports can be submitted to the judges. Nearly all the contestants have made perfect scores—that is, have had no repair expenses whatever, so that the winners are likely to be those who have piled up the greatest mileage.

Although it was purely a stock car, the Simplex made a remarkable showing in the recent time trials at Jamaica, doing the kilometer in :32 and the mile in 51 seconds, while it covered the two miles in 1:44, these times coming particularly close to the star performer of the day, and leading the other competing four-cylinder stock cars by an ample margin.

An order, which seems to mark the beginning of an automobile experiment in the public transportation problem in Boston, was received by the Atlas Motor Car Company, Springfield, Mass., June 8, for 25 taxicabs, regular stock model, painted blue with yellow panels, from a new transportation company in the Hub, which also operates in Philadelphia. This is said to be the largest order of this type of car ever sent out from Boston.

The Speedwell Motor Car Company, Dayton, O., builders of the Speedwell car, have recently found it necessary to add a night shift to their working forces in order to be able to keep up with the constantly increasing flow of orders. Five new buildings have been added to the plant this season, but the business has already outgrown the capacity of the factory and further additions are contemplated in the near future.

Frank Yerger, in charge of the Studebaker Branch in Philadelphia, recently had occasion to make a few demonstrations of the Studebaker Model 22 electric runabout in Atlantic City, but instead of shipping the car by rail, decided to drive it over the road to Atlantic City, a distance of 66 miles. Although it rained most of the time, and the roads were bad, John White of the Philadelphia Branch, made the run easily on one charge of the battery and not a bit of trouble was encountered.

"We recently received from the Knox Automobile Company a set of eight bearings taken from one of their cars after a 15,000-mile service, with a request for a condition report," says the Hess-Bright Company, Philadelphia, Pa. "The most careful measurements showed that only one bearing had more than a half thousandth of an inch radial play. All bearings were in such excellent condition that they would

stand at least another 15,000 miles. This is by no means an unusual record for our bearings, as we have many instances of 60,000 miles run without trouble."

For the fire department of Greater New York the Diamond Rubber Company received in May an order for 14,000 pounds of solid rubber tires. To this order 12,000 pounds additional were added June 10, making a total of 26,000 pounds of rubber the Diamond company is to furnish for New York Fire department equipment for the coming year. The tires are of the internal wire and side wire type, and cover a great variety of sizes.

Added to the prestige of three new world's records made at the time trials at Jamaica, the Michelin Tire Company carried off the honors of the day among medium-priced cars also, a Pennsylvania car equipped with Michelin tires winning handily in its class; the owners of light cars vying with drivers of heavy cars in equipping with Michelin tires. Manager Hobbs of the New York Michelin branch reports a heavy percentage of purchases by owners weighing 2,000 pounds and less.

The National Sales Corporation has recently signed contracts with the Anderson Forge & Machine Company, Detroit, Mich., covering the sales of that company's product. By this arrangement the Anderson Company has secured the advantages of a complete selling organization, including office force and traveling salesmen familiar with the automobile accessory line, at far less expense than they could maintain an equivalent organization. The Anderson Company have a large plant particularly equipped for the manufacture of steam and drop hammer forgings in the rough or finished.

The Lozier factory at Plattsburg, N. Y., numbers among its large force several athletic organizations. The Lozier baseball team have this season proven the amateur champions of that section of the state. Last week, H. C. Pray, a member of the mechanical department, performed a feat of pedestrianism of more than ordinary ability, walking 52 miles from Lake Placid to Plattsburg through the Adirondacks in 9 hours and 55 minutes. Twelve miles of this walk was through deep sand. Harry Tyler, ex-world's champion bicycle rider, is now connected with the Lozier Company, having charge of the shipping department.

The Logan Construction Company, Chillicothe, O., has been shipping out a number of trucks recently, among them a Model S three-ton truck to the Fitzsimmons-Palmer Company of Duluth, Minn., a Model T one-ton truck to the Hoffman-Billings Company of Milwaukee, Wis.; a Model S three-ton truck to Proctor & Gamble, Ivorydale, near Cincinnati, O., prominent soap manufacturers; a Model S three-ton truck to Chris Mincy, Columbus, O., who will use it for passenger work, and a Model R delivery wagon to the John N. Loesser Mfg. Company of New York City. The Logan Company reports that the outlook for business is growing steadily better and that there is a good reason to believe that it will soon be better than ever.

"What's a record for if it's not something to be beaten at the first opportunity? One hundred cars a day wasn't even dreamed of three years ago. Last year we made it 83 in one day, last week we shipped 100 cars in one day, next week we may beat

it; next year we will *have* to beat it." That comment of Henry Ford is typical of the spirit of the man—the spirit which compels him to keep on pushing ahead to larger victories. He was commenting on the record-breaking day of June 4 when a total of 101 cars were built, tested and shipped in ten hours. This means a car every six minutes, ten cars an hour. The occasion was one of a series of attempts on the part of the manufacturing department to ship more cars than were sold in the same day. In this they almost succeeded—would have, had not several telegrams come in late in the day, bringing the total sales of the day up to 117 cars—another record, by the way.

"I don't believe the work done by Stearns cars the last two weeks in races, hill climbs, etc., all over the country, has ever been equaled by any other car before," said Roy F. York, vice-president of the F. B. Stearns Co., a few days ago. "It is all the more remarkable," continued York, "when it is remembered that all these reliability runs, hill climbs and speed contests have been won by amateur drivers and private owners. Some time ago we announced that we would not participate in contests as a company, and we have rigidly adhered to that policy. Many Stearns owners have entered such events, though, and in every case the Stearns has come through victorious. On Decoration Day and the following Saturday we took part in and won numberless events all over the United States, winning first place more than a score of times. It's all right to win as a company, as we have in the past, but when amateurs take their cars and do as good work as we could it means a great deal."

PERSONAL TRADE MENTION.

W. J. Sprankle, who handles the Premier and Reo cars in Philadelphia, at 242 North Broad street, has secured the local agency for the Overland, and will at once begin enlarging his quarters to make room for the addition to his line.

Oscar Stegeman, for some time past chief engineer of the A. O. Smith Company, Milwaukee, Wis., manufacturers of automobile parts, has recently severed his connection with that concern. No announcement is made as to his immediate plans for the future.

J. Robert Maynes, who first came into prominence as a driver by winning the first 24-hour race in Philadelphia in an Autocar, has joined the selling force of the West-Stillman Company, the Quaker City agents for the Pennsylvania, Atlas, Pope-Waverley, and Mercedes.

Charles R. Greuter, who has been the designer and chief engineer for the Matheson Motor Car Company, Wilkes-Barre, Pa., since 1903, severed his connection with that concern on Monday last. He will spend some time in a New York hospital in order to have an injury to his leg, received in a recent accident, properly treated and will then announce his plans for the future.

Charles M. Strieby, long connected with the Ford interests in Philadelphia, and the organizer of the Ford Motor Club, in that city, was married on Saturday last in St. Francis de Sales' Church, to Mrs. Marie Lopez Pulsifer. After the ceremony the bride and groom left for an automobile honeymoon trip during which they will visit all the resorts along the Jersey coast.

INFORMATION FOR AUTO USERS

The Recometre.—"A perfect, permanent and positive record of every movement of the car, every minute of the day, every day in the year; records distance, speed, time, and stops, from start to finish." This, in the words of its makers, the Recometre Company of America, Broadway and Seventy-fourth street, New York, briefly

EXTERNAL VIEW OF THE RECOMETRE.

describes the purposes of this new instrument. It is a combination device consisting of a clock, a perfect calendar, showing the day, month and year, and it makes and shows a complete record, in ink, of the number of miles traveled, how many minutes it takes to make each mile and half mile, also the number of stops made, the time each stop was made, the number of minutes the car remained standing, and the exact time of starting the machine again. The record is mathematically correct, the recording pen being moved by gearing connected with the car, this record being made for every minute in the day and every day in the year. The speedometer attachment indicates speed and distance in the usual manner. The construction of the Recometre permits of the instant examination of the tape at any time of the day and has in plain view the record for the preceding half hour.

U. S. Fireless Cooker.—This is an improved method of cooking by means of retained heat that has been adapted for use on the automobile through the employment of a light and compact container made of the same material throughout—indurated fiber. This material is light, non-absorbent and hygienic, and will not rust, leak or crack, as is the case where metal is employed for the purpose. Several sizes of these fireless cookers are made, ranging from dinner pail up to the 8-quart size, and all have sufficient capacity for several dishes.

HANDY FOR AUTO RUNS AND TOURS.

the case where metal is employed for the purpose. Several sizes of these fireless cookers are made, ranging from dinner pail up to the 8-quart size, and all have sufficient capacity for several dishes.

Sterling Timers for Fords.—One of the latest specialties introduced by the Sterling Alternating Ignition Company, Binghamton, N. Y., is a vertical timer designed to be placed on Ford runabouts, Models N and R, to take the place of the equipment fur-

nished by the manufacturers. Its application is very simple, no tool work being necessary other than the drilling and tapping of two 1-4-inch holes in the cylinder to take the supporting bracket forming part of the outfit supplied. The gear is fastened to the camshaft by two small set screws, the gear case being held to the engine base with the same set screws that held the former bearing, which is replaced by the case. A dash bracket with bell crank is furnished, by means of which the timer is connected with the advance lever.

PR Gasoline Indicator.—This is one of the most practical and simple devices for indicating the depths of gasoline in a tank that has been placed on the market, the principle being that of a float rising on a spirally bent standard, thus causing the pointer to revolve about the dial. It is being manufactured and marketed by the PR Manufacturing Company, 621-659 Belle-

HOW THE PR GASOLINE INDICATOR WORKS

vue avenue, Detroit, Mich., and is constructed in such a simple and durable manner that it is practically indestructible. It can be attached to either a full or empty tank in less than ten minutes, no soldering being necessary. The dial face is protected by heavy plate glass, while the float is so constructed that it cannot stick at any point in its rise or fall, thus becoming dormant. The use of such a gauge not alone does away with the necessity of thrusting a dirty stick into the tank, but gives a certain indication of what mileage the car is making on its allowance of fuel, thus showing whether the motor and transmission are up to their original degree of efficiency, or not.

G & K Tire Sleeve.—This is a device which is the product of the Graton & Knight Manufacturing Company, Worcester, Mass., and is unique in being made from leather of a special grade from their own tannery. This leather combines extreme toughness with flexibility and long life. That part of the sleeve which takes

the greatest amount of wear is of double thickness and is heavily studded with iron rivets. It is designed to be laced to the

G & K TIRE SLEEVE AND LACING.

shoe of the tire, sufficient rawhide lacing being provided for this purpose.

Trojan Hydro-Pneumatic Spring.—Among the numerous advantages claimed for this new method of suspension for the automobile, the makers outline seven of the most important as follows: (1)

There is no adjustment whatever necessary on this device as the piston is self-adjusting against wear and pressure and the whole spring is constructed so as to accommodate itself to any load. (2) You can dispense with pneumatic tires and use solid, thereby eliminating all tire troubles, and increase the safety of riding. (3) No more broken springs and coming home on slow speed with blockings between axle and body. (4) Ability to go at high speed over rough streets and roads without jolt or jar or danger to your car. (5) Simple construction makes your springs wear indefinitely and renders them indestructible. (6) Fulllest enjoyment and safety always. (7) Moderate prices for equipment.

SECTIONAL VIEW OF HYDRO-PNEUMATIC SPRING.

As will be noted from the accompanying sectional view of the Hydro-Pneumatic spring, it consists of an air-chamber superimposed over a cylinder partially filled with oil. The former is attached to the frame of the car, and the latter to the axle and they are designed to move into one another in accordance with the variation in the load of the car and the shocks caused by meeting obstructions. It is manufactured by the Trojan Hydro-Pneumatic Wheel Company, Inc., Watervliet, N. Y.

NEW YORK—THURSDAY, JUNE 25, 1908—CHICAGO

10 CENTS

The Tire you are coming to

THROUGH experiment and experience—to Goodrich Tires: that is the tire history of thousands of automobilists—but it need not be your history. You can eliminate the experiments and the expense by examining the Goodrich record of service; by learning the **road results** of the Goodrich “tough tread” and Goodrich “integral construction” on every street and highway in America. Start with a Goodrich equipment and you will finish with it. We shall be glad to explain Goodrich construction and furnish evidence of Goodrich superiority on request.

The Justly
CELEBRATED
8-Day, High-Grade

"CHELSEA" AUTO CLOCK

(Trade Mark)

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly water-proof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock when removed from outer (locked) case is excellent for use on mantels, bureaux, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3 1/4" MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

PRICE LIST

Prince Henry Tour Fittingly Succeeds Germany's Classical Herkomer

How the Start Was Made from the Suburbs of Berlin, Amid a Multitude of Onlookers.

FRANKFORT-ON-THE-MAIN, June 17.—Of 130 cars which started from Berlin on June 9 in competition for the Prince Henry Cup, 112 finished here to-day. The provisional winner is Fritz Erle, of Mannheim. The official list, however, has not yet been prepared, but will probably confirm the announcement.

The night stopping places which show the route of the tour were: Stettin, Kiel, Hamburg, Hanover, Koen, Trier and Frankfort. Most of the competing cars were of German make, but among the contending drivers were ten Belgians and nine Frenchmen, which gives the tour an international flavor.

BERLIN, June 9.—Teutonic method and thoroughness have reached their highest expression in the Prince Henry Cup, the great touring competition of the year, the substitute for the Herkomer Cup. To the uninitiated there was something strange in the 135 vehicles which presented themselves for weighing in at Charlottenburg, the charming suburb of Berlin, where Prince Henry presided in person and was assisted by a staff of military looking officials.

According to the regulations it is a touring competition of about 1,800 miles in seven stages, on a schedule fixed by the Emperor's brother and which must never be exceeded under any circumstances. It would perhaps be more correct to say that it is a procession, for the average speed for the different stages

remains around 30 miles an hour, on no account must the pilot car be passed, and it is not even allowed to go ahead of a competitor unless he is broken down.

Yet of the 130 competitors 100 at least are specially built cars with 4 1-2-inch bore engines having a stroke of 7 inches, specially lightened chassis, and four-seated bodies having as much resemblance to the real touring body as exists between the Stanley sprinter and a limousine. The reason for this anomaly is that the competition really resolves itself into a speed test and a hill-climbing competition. The touring procession will doubtless eliminate a few, for some drivers find it impossible to keep out of trouble, but practically all will be lined up for the straightaway test and the mountain speed work which will determine the awards. It is for these two tests that German manufacturers have built special long-stroke engines and designed four-seated aluminum bodies on the lines of a torpedo. It is for these two tests only that the cars are running with open exhaust, with horizontal mudguards, or without mudguards, with V-shaped front and with tumble home rear. There is a tremendous amount of publicity attaching to the competition organized by the Emperor's brother and the work of producing special models should bring its reward, when considered in the advertising sense.

For the final classification account is taken not only of the cylinder bore but of the weight of the car, the speed required

Special Body Built to Save Wind Resistance.

Another Special Type Not Designed for Comfort.

on the level and hills being in proportion to the bore of the cylinders. Before the start of each day's journey one hour is allowed for working on the cars, every extra minute being charged at the rate of 2-10 of a point. Stops on the road for any repairs other than those of tires will be penalized in the same way. Taking in of oil, for brakes or radiators, is penalized 5 to 10

points when this operation is performed away from the control.

The majority of the cars are of German origin, specially built for the competition. France, Italy and Belgium are represented by a few of the best factories of each of these countries, and England has a champion in S. F. Edge and one of his six-cylinder Napiers. In most cases the foreign cars are handled by amateurs.

NAZZARO DRIVES 120 MILES PER HOUR AT BROOKLANDS

LONDON, June 17.—Nazzaro has beaten Edge at his own game, and at the same time put up a record for the Brooklands track of 120 miles an hour. It will be remembered that a few months ago, when S. F. Edge was under fire for his refusal to enter the Grand Prix unless detachable wire wheels could be used, a challenge was sent forth by the Napier manager to match his six-cylinder cars against any other car built for the great French race. The conditions were in favor of the Englishman, for he stipulated that the match should be run on the Brooklands track, and, as everybody knows, the Napier people have practically taken possession of the British autodrome.

The Fiat firm took up the challenge and sent over Nazzaro with a racer carrying a Grand Prix engine. On the start being given Newton, the crack track driver of the Napier company, shot over the line and got a good lead over the Italian four-cylinder car. On the second round the British six-cylinder was leading by 300 yards. Then Nazzaro opened out full, shooting ahead at such a speed that he rapidly overhauled the Napier and passed it amid tremendous excitement. As he went by the British car the official timers declared a speed equal to 111 miles an hour. A little further ahead the speed was still further increased by Nazzaro, the timers of the Royal Automobile Club swearing to 120 miles an hour. When two-thirds of the total distance of 27 1-2 miles had been covered, Newton, who was well to the rear, suddenly pulled up with a disabled machine. According to one report put forth by the employees an engine bearing had seized; another explanation was that a piston had broken.

Nazzaro, who is exceedingly popular in England, was handicapped by reason of his unfamiliarity with the Brooklands track and found it necessary to carry a mechanic with him. Newton, on the other hand, drove alone, his chances being further increased by the uninterrupted experience he has had on the Brooklands track since its opening. The defeat of the Napier is considered as a blow to British prestige, for Edge had earned for himself the reputation of being unbeatable at this class of speeding.

The sport was opened on Saturday afternoon, June 9, by an "All Comers' Handicap" of ten starters. An exciting struggle brought victory to a 35-horsepower Berliet, a 75-horsepower Mer-

cedes, and another 35-horsepower Berliet finishing close up behind the winner—an indication of the increased skill of the handicappers. Here it might be mentioned that, in connection with Brooklands, all engines are rated by the RAC formula of $\frac{D^2H}{2.5}$, without any reference to the makers' listed power.

A novelty was provided in the Limit Stakes, where any speed in excess of 50 miles an hour entailed disqualification, speedometers being barred, of course. The three cars which first passed the judge were all disqualified for passing the speed average, and Sir G. Abercrombie's Fiat was declared the winner, with 49 1-2 miles an hour to its credit.

The first of the three matches now attracted all the attention. Oscar Cupper's 26-horsepower Metallurgique was brought up alongside the 26-horsepower Napier, the distance being 14 miles and the stakes £500. Newton piloted the Napier, which was designated *Firefly*, in accordance with the new system of optional registration by name just adopted by the Brooklands authorities. From the start the Napier jumped away, and very soon it was apparent that the Metallurgique was out of the race, a faulty magneto proving its undoing. The average speed of the Napier was 78 1-2 miles an hour—an excellent performance for a four-cylinder engine of only four inches bore. The failure of the Belgian car was most disappointing, especially as this make is noted over here for its high efficiency and speed.

Monday, June 9, brought together the biggest crowd that has yet visited the course, the great attraction being the Napier-Fiat race for £500. Two heats of the handicap race for the Earl of Lonsdale's Cup were first run through, a 40-horsepower Vinot and a 36-horsepower Austin winning the two heats at speeds approaching 70 miles per hour.

The last event of interest was a novelty termed the Training Plate, confined to the three Austin racers which have been entered for the Grand Prix. After the first lap the cars had to be stopped, and the two rear types changed without any outside assistance, a second lap then being covered to the finish. Resta proved an easy winner, mainly owing to his extraordinary manipulation of the tires. Warwick Wright was second and Moore Brabazon, the amateur who won last Ardennes Circuit race, took third place.

NO PRACTICE WORK ON GRAND PRIX COURSE

By W. F. BRADLEY.

PARIS, June 16.—There will be no trial spins on the Dieppe course before the Grand Prix, the Dieppe consultative committee and the Sporting Commission of the Automobile Club of France having decided that they are useless. Last year two days were allowed before the race in which drivers might become closely acquainted with the course. As fuel consumption does not now enter into consideration, it has been decided to abandon the tests, as they are not considered essential.

Power Plant of the Thomas Grand Prix Racer.

It would doubtless be more correct to say that the official trials have been abandoned for fear of accidents and in order that the road should not be spoiled. Out of over one hundred cars there is always a possibility of one meeting with an accident, and if anything of a serious nature should happen before the race a public outcry would certainly follow. When the work now in hand is completed the course will be in perfect condition, tarred from starting to finishing line, wider than it was last year—in brief, a sandpapered track. To let the racing cars loose would simply undo all the work of the past few months. The officials realize this, and have, therefore, taken the decision to keep the speed monsters off.

The American and the English teams are the only ones likely to suffer any inconvenience from the closing of the course. Strang has driven round on the touring car three or four times, and immediately on returning to Dieppe will recommence his daily practice work. Even if larger spockets are put on the touring car, however, the experience will be the same as a run round the course on the racer. Strang will thus have to learn what he can do on the sharp turns during the initial round on July 7.

Though the 47 miles of the Dieppe course will have a perfect surface on the day of the race, it must not be imagined that the task of the driver is limited to opening out his engine and letting his car run. From the grandstand on the Dieppe-Londinieres leg of the triangle there is a straightaway where 100 miles an hour is not at all an impossibility. A few turns of but little importance, then a descent is made into the village of Envermeu, which on the day of the race will be stoutly barricaded down

both sides and provided with a wooden bridge so that one side of the village street may not be altogether out of touch with the other.

From Envermeu to Londinieres is varied road; a few miles of straightway, with the primitive narrow track railroad as a companion on one side of the road, a few turns on down grades that will serve to keep the drivers awake, but nothing to cause any serious trouble. At Londinieres there is a double S turn passing over the railroad tracks—no trains will be running on the day of the race—followed by a long winding ride. This is undoubtedly one of the most difficult spots on the course, and the one on which the driver can best show his ability.

Immediately the double S turn has been negotiated, a winding climb commences and continues for three or four miles. Here again there will be an opportunity for a driver to show his skill, and to either gain or lose time, according to his ability. The hill-climbing power of the car will also be put to a test, for it will be necessary to drop into third speed for most of the distance.

Half way round the second leg there is a down grade that calls for a little caution, a short, stiff hill-climb, then a straightaway, on which Strang, who introduced us to the course, showed how his Thomas Flyer could run all out. Into the village of Eu there is a steep down grade. At the foot of the hill a wide hairpin turn has to be made through the center of the market place, then half a mile of 12 per cent. grade has to be negotiated. For five miles the road is a variation of up and down grades, calling for occasional touches of the brakes and a little handling of the change speed lever. When Criel has been passed through an opportunity is again presented to open out to the full along the seashore stretch of road. For ten miles it is possible to run all out, with but an occasional partial closing of the throttle for a few slight turns. During the last few miles of this shore stretch it is possible to look away to the left to the opposite side of the triangle on which the grandstands are placed. Three miles from Dieppe is the hairpin turn, necessarily calling for a closing down, but wide enough for the ordinary driver to get round without much difficulty. A mile further on, and the grandstands are reached.

Last year the club placed the stands a couple of miles from the Dieppe hairpin, on the seashore stretch of the road, but with their backs to the sea. This year they have been moved over to the opposite side, and are now on the outside of the course, with a northern aspect and open to the sea breezes. The change of position not only allows spectators to watch the cars on a long straightaway immediately in front of the stands, but per-

The Austin, the English Car That Drew First Starting Honors in Grand Prix.

mits them to look across country and see the cars speeding down to the hairpin. The turn itself is hidden by a dip in the land; the loss, however, will be of but short duration, and a second after the turn has been taken the car will again be in view on the inner straightaway.

Gasoline and tire stations are this year in a long pit at the foot of the grandstands. Spectators will thus have right below them the operations of changing tires, filling tanks, etc., immediately beyond some of the fastest speeding the course can produce, further away the outer leg of the triangle, and beyond that the blue waters of the English Channel. The score board will be on the inside of the course, built low, so as not to obstruct the view across country, and with figures, so say the officials, sufficiently large to be read without the use of glasses. A tunnel, already completed, will be the sole means of communication at this point between the outer and the inner side of the circuit.

America's car for the Grand Prix is now practically ready for the great test. Owing to damage in transit it was necessary to run up to Paris and fit a new radiator. Advantage, too, was taken of the dismounting of the engine for verification purposes to reduce the weight somewhat and make a few changes with a view to decreasing wind resistance. After carefully measuring each of the four cylinders and noting that there was a millimeter leeway, Comte de Lavalette, the club official, affixed the club seal and assembling was begun.

This week the entire Thomas team will leave for Dieppe, taking with them both the racer and the touring car. It is Strang's intention to make long runs out from Dieppe each day until the racer is in perfect condition, and to make himself thoroughly familiar with the course by an hour's practice with the touring car every morning. Harry S. Houpt and the members of the racing team are convinced that, although they may not be able to beat all the speed monsters of Europe, they will give a very satisfactory display of speed and endurance on July 7.

Sudden Death of Official Timer Tampier.

PARIS, June 16.—All who have been present at the great speed tests organized by the French club will read with regret of the sudden death of Charles Tampier, official timer of the Automobile Club of France. There is a certain amount of tragedy attached to the sudden removal of Tampier from our midst, for it was at first supposed that he had been poisoned at the club banquet in honor of the recent industrial vehicle trials.

Immediately after this banquet, offered at the clubhouse, and under the direction of the chef of the A. C. F., a number of persons were taken ill, some so seriously that medical attendance had to be called. Tampier was one of the number, the attack in his case being so grave that, after a few hours' suffering, he expired. A considerable stir was made in automobile circles, the report being freely circulated that Tampier had been poisoned as the result of partaking of canard a la rouennaise. A post-mortem examination has been held, the result of which has been to prove that the banquet was only partially responsible for the death of M. Tampier. So far as can be learned, the deceased had been in indifferent health for some time, and the slight poisoning set up at the banquet in his case proved fatal.

M. Tampier, who graduated into the automobile business from the cycle trade, first came to notice by success on the wheel. In Paris he had been connected for some years with various automobile journals, and for a number of years had been one of the official timers of the Automobile Club of France.

BLANKS ARE ISSUED FOR SAVANNAH RACE.

The Automobile Club of America has issued entry blanks for the race it proposes to run at Savannah, Ga., on Thanksgiving Day, under European rules. The blanks embody the particulars and conditions announced by the New York Club and published at the time. Additional information given is to the effect that the length of the race will be 400.95 miles, made up of 15 laps of 26.73 miles each.

THOMAS CAMP NEWS FROM HOUPT.

At last Harry S. Houpt seems to have found time to write his partners some particulars of what the Thomas Flyer outfit has been doing in the way of preparation as America's sole representative this year in the Grand Prix to maintain the reputation of this country's sport and industry in the great annual international struggle over the Dieppe course on July 7.

Hitherto Mr. Houpt has found time only to write brief letters, promising another with fuller particulars of the situation at the American camp later. That tardy letter was received at the Harry S. Houpt Company, the New York representative of the E. R. Thomas Motor Company, of Buffalo, on Saturday.

Mr. Houpt writes that training quarters have been secured at Dieppe and that everything is now in readiness for the great race.

Those members of the racing team not holding the French driving license were obliged to undergo an official test in the streets of Paris. "Monty" Roberts, who was one of the unlicensed members, had to undergo the test, much to his amusement. After a quarter of an hour in traffic, however, the Government inspector was convinced that the pilot of the New York-Paris race knew enough about an automobile to be licensed.

One of the most important formalities in connection with the race was the verification of the cylinder bore, which as is well known must not exceed 155 millimeters. The operation was simplified on the Thomas car from the fact that the bore had been

The Houpt Party in Front of Grand Palais, Paris.

In the Thomas Flyer are Mr. and Mrs. Harry Houpt and Miss McCartney. Montague Roberts is at the wheel.

limited to 154 millimeters, in order to prevent any possibility of dispute at the last moment. All European cars, on the other hand, have been built up to the full limit allowed under the rules. A few minor changes have been made on the car in order to reduce wind resistance and slightly decrease weight, but as it stands ready for the race the American champion is in every essential feature a stock runabout. All the European cars, on the other hand, are specially constructed cars, rating from 110 to 130-horsepower. By competing against Europe with an everyday product, it is believed that the best demonstration can be given of the reliability and endurance of the Thomas Flyer. Strang will carry with him as mechanic Auguste Guichard, while Montague Roberts, who has been entered as reserve driver, will be ready to take the wheel in case of any mishap prior to the race.

After a few days at Dieppe securing headquarters for the race, Strang drove the car down to Paris, covering the 100 odd miles in less time than is occupied by the express trains of the Western Railroad Company. This was accomplished on a Sunday afternoon, when, owing to the amount of traffic, it was necessary to proceed cautiously in all villages.

In common with all other firms, the Thomas Company will have a gasoline and tire stand immediately in front of the grandstand, and it is here that the mechanics and general utility men will be in readiness to hand over anything needed.

Where the Competent Corps of Track Officials Established Headquarters.

BOSTON, June 18.—The race meeting of the Bay State Automobile Association originally scheduled for Memorial Day was held yesterday at Readville track, and the delay proved more beneficial than otherwise. The track was in excellent condition and while no records were broken there were many fast miles, plenty of exciting brushes and the competition all through was close and interesting. The crowd of spectators was very large, it being estimated that seven or eight thousand people were on the grounds and six or seven hundred automobiles. Not a single accident of any kind to drivers, cars or spectators served to mar the afternoon's sport, and the prizes were well enough distributed so that nobody had a walkover. As not infrequently happens, the star attractions did not pan out as well as had been expected. Barney Oldfield and his Briarcliff Stearns had to take the dust in every event but a single heat of a five-mile race, and Christie's racer, driven by Morton Seymour, failed to work well in the match against Bowden's Flying Dutchman, driven by Charles Basle, though a little earlier in a one-mile exhibition the Christie made the fastest time of the day, circling the track in 56 3-5 seconds, only about three seconds slower than the record made by Baldwin with a steamer some years ago. Basle, driving an exhibition mile with the Flying Dutchman, could make no better than 58 seconds, though in the five-mile match against Seymour Basle's time was 4 minutes 49 2-5 seconds. In this event Seymour dropped out in the second mile.

The largest share of the honors went to the six-cylinder 45.6-horsepower Berliet, driven by H. F. Grant and entered by the Park Square Auto Station of Boston. Grant won the 20-mile stripped gasoline chassis event, after taking a preliminary five-mile heat,

and also won the five-mile handicap. In the 20-mile race Grant gave as pretty an exhibition of consistent driving and the Berliet of steady running as could be desired. Taking the lead at the start, the Berliet reeled off the 20 miles in 20 minutes 28 1-5 seconds, the miles not varying three seconds from start to finish. The second, eighth and ninth miles were made in one minute flat, and at the finish the Berliet had a quarter mile lead over its nearest opponent, the Allen-Kingston Briarcliff racer driven by Ralph DePalma, whose time was 20 minutes 44 seconds. In this event the Thomas "Blue Bird," driven by L. B. Lorimer, was going well until the eighteenth mile, when it had to stop because of tire trouble. The first preliminary five-mile heat was one of the most interesting contests of the day, for it brought together Barney Oldfield with the Stearns Briarcliff car and DePalma with the Allen-Kingston Briarcliff representa-

tive. Oldfield had to eat dirt from the start and was an eighth of a mile behind at the finish. DePalma's time was 5 minutes 13 seconds. The third car in the heat was the Corbin. In the second heat the Berliet had as opponents the Thomas "Blue Bird" and an American roadster driven by J. Andrews. The Berliet won in 5 minutes 19 1-5 seconds, the "Blue Bird" finishing in 5 minutes 26 seconds. The American did not finish.

In the five-mile handicap the handicaps were based on the fastest miles made by the different cars during the day, and the Berliet had 700 feet over the Allen-Kingston, which was on scratch, having made a mile in 58 2-5 seconds. The Thomas "Blue Bird," whose best mile was 58 3-5 seconds, was given 100 feet and the American had 3,600 feet. It was an easy victory for Grant and the Berliet in 4 minutes 59 1-5 seconds. The Allen-Kingston was second in 5 minutes 19 seconds.

There were eight events on the card and they were run off very smoothly with the exception of an interval when Seymour was endeavoring to get the Christie racer tuned up for the match with

Webster in Stoddard-Dayton Overhauling Marmon in Five-mile Event for Touring Cars.

Grant and His Locomotive That Captured Two Firsts.

Basle. The racing began at 2 o'clock and the first event was at five miles for gasoline touring cars, 24.1 to 40 horsepower, with three starters, the 40-horsepower Marmon, entered and driven by F. E. Wing, the 40-horsepower Crawford, driven by the veteran manufacturer, R. S. Crawford, and the 36.1-horsepower Stoddard-Dayton, entered and driven by Stanley Webster. Wing cut out the pace for the first two miles, but it was too fast and he had to give place to the Stoddard-Dayton, which won in 6 minutes 10 3-5 seconds, with a half mile to the good over the Crawford.

The second event was the free-for-all gasoline stock runabouts and tourabouts, and it was run in two preliminary and a final heat, each of five miles. In the first heat were Oldfield with the Stearns and DePalma with the Allen-Kingston, and they made a pretty race of it. Barney got the jump at the start and cut out the five miles in 5 minutes 23 seconds, DePalma finishing in 5 minutes 44 seconds. In the second heat were the Thomas "Blue Bird," with Lorimer at the wheel, an American roadster driven by J. Andrews, and the Marmon driven by F. E. Wing. The Thomas had no trouble in winning by three-quarters of a mile over the Marmon, the American dropping out. The time of the Thomas was 5 minutes 31 3-5 seconds. In the final heat were the Stearns, the Allen-Kingston and the Thomas. After a false start the cars were called back and sent away a second time. De Palma won in 5 minutes 23 4-5 seconds, with the Stearns second in 5 minutes 29 1-5 seconds. The exhibition miles by Seymour followed. Then came the 20-mile stripped chassis race won by Berliet.

The 20-mile special race for gasoline cars of 40 horsepower or less, selling at \$3,000 or less, had five entries, but only two came to the tape, the Thomas "Blue Bird" and an Oldsmobile entered by the Algonquin Motor Car Company and driven by J. W. Snyder. Lorimer had things his own way, however, the Oldsmobile quitting in the seventeenth mile. The time of the Thomas was 21 minutes 56 2-5 seconds.

Thomas Detroit, with Lorimer, That Won Twenty-mile.

An amusing feature of the afternoon was the music. The band that was hired for Memorial Day played its program on that day safely protected from the rain on the clubhouse piazza. Fearing to undertake the expense of hiring another band for to-day, the management secured a Gabriel pipe organ, which was attached to a Peerless six-cylinder car and operated by W. W. Lusk, of New York. It proved an agreeable substitute. The summary:

FIVE MILES, OPEN TO GASOLINE STOCK TOURING CARS OF 24.1 TO 40-H.P.

- | | | | |
|--------------------------|------|----------------------|----------|
| 1. Stoddard-Dayton | 36.1 | Stanley Webster..... | 6:10 3-5 |
| 2. Crawford | 40 | R. S. Crawford..... | |

JERSEY AUTO LAW CAUSES GREAT LOSS.

TRENTON, N. J., June 19.—Men prominent in the State and automobiling were in attendance at the buffet smoker the Mercer County Automobile Club gave at the Dauphin Country Club last Tuesday evening. Among them were Judge William H. Speare, of Jersey City; F. H. Elliott, secretary of the A. A. A.; H. A. Bonnell, former secretary of the New Jersey Automobile and Motor Club, of Newark, and W. F. Sadler, Jr., former president of the Associated Automobile Clubs of New Jersey.

In view of the movement to organize autoists in every section of the State to cooperate with dealers and trade associations, the speakers dealt chiefly upon the advantages to be derived from organization. Mr. Bonnell stated that the members of the club at Newark would cooperate with the Mercer County in every way possible.

Statements were made to the effect that the tradesmen and merchants, hotel and garage proprietors had felt the effect financially and in other ways of the automobilists from other States not entering New Jersey, owing to the exorbitant fees which are required under the new automobile law.

LOWELL'S FOURTH OF JULY RACE CALLED OFF.

BOSTON, June 22.—It is definitely settled that there will be no 250-mile road race in Lowell on the Fourth of July. The Lowell club, however, has secured the passage of a law permitting the authorities of the city of Lowell and the adjoining town of Tyngsboro to close roads for an automobile race, and the club is now planning to hold the event on Labor Day.

A HALF a hundred New Yorkers are touring New England this week in a caravan of a dozen cars. The occasion is the so-called "Ideal Tour," which is being promoted by the Automobile Club of America. It has for its object pure pleasure undiluted by point penalizations and without contest restrictions to hamper its go-as-you-please delights. To be sure, there is pretense of classification into three divisions of 20 horsepower, 20 to 40 horsepower, and over 40 horsepower, with speed limited respectively to 14, 18 and 20 miles per hour. All these restrictions, however, have been cast to the winds that the tourists may proceed untrammelled and happy on their way.

The "Ideal Tour" idea seemed good enough for 19 to make formal entries. Only 14 of them, however, showed up for the start from the palatial home of the New York club on Friday morning. The initial caravan was made up as follows: Pilot car, Stoddard-Dayton, Mr. and Mrs. A. L. Westgard; No. 30, C. G. V., Mr. and Mrs. Waldron Williams and Andrew Fletcher; No. 14, Simplex, Dave Hennen Morris and chauffeur; No. 5, Locomobile, Robert Lee Morrell and chauffeur; No. 4, Packard, Mr. and Mrs. Winslow Tracy Williams and chauffeur; No. 22, Peerless, Mr. and Mrs. Carl H. Page, Harry Urwin, H. F. Caldwell and Vance Schaerer; No. 10, Royal Tourist, Mr. and Mrs. Orrel A. Parker and chauffeur; No. 20, Darracq, Dr. and Mrs. Calvin T. Adams; No. 18, Fiat, Mr. and Mrs. Albert De Verastegin, daughter, Miss Helen, and chauffeur; No. 16, Peerless, Mr. and Mrs. Lamar Washington; No. 12, Lozier, Mr. and Mrs. R. F. Outcault, Mary Jane Outcault and R. F. Outcault, Jr.; No. 11, Lozier, Commo-

dore and Mrs. H. C. Roome; No. 19, Matheson, Mr. and Mrs. Daniel Daly; No. 21, Ford, Mr. and Mrs. F. D. Hughes.

Waterbury, Conn., 92 miles distant, was the objective point of the first day's run. The cars got away at average intervals of ten minutes. This and the comparatively small size of the touring caravan left nothing of a dust evil to be endured. The run was out the shore road to Norwalk, where the tourists rendezvoused for luncheon. At Stratford the caravan left the shore road for the picturesque highway along the Housatonic River. From Shelton the journey was through the beautiful Naugatuck Valley to Waterbury. The night's stop was made at the Hotel Elton, a new and well-appointed hostelry. An exciting incident of the first day's run was the rescue of two Yale students who had backed their car down a 30-foot embankment.

The roads met with were for the most part fine, though there were repairs in progress in the Naugatuck Valley. A new road, by the way, is promised between Shelton and Waterbury.

The better part of the second day's journey was through the Berkshire Hills. The objective point was Manchester, N. H., with Lenox the luncheon place. In the day's run of 137 miles the tourists drove through parts of three States—Connecticut, Massachusetts and New Hampshire. It was by no means an easy day's run, and many of the cars did not reach Manchester until 8 o'clock. A late start, however, was partly responsible.

Dave Hennen Morris and Robert Lee Morrell left the tour at this point, being called back to New York by business. Not all of the starters proceeded with the main party on Sunday's 74-mile run to Lake Sunapee, several deciding to lay over for a day or two. Many touring automobiles were met en route, however, and these joined the run for short stretches.

At Claremont a big delegation of autoists met the tourists and escorted them through the town. At Newport a reception was tendered by the town's Board of Trade. So hospitable were the Newporters that several of the cars remained over night and joined the tourists the next day at Soo-Nipi Lodge, for the ninety-mile run to Bretton Woods.

The run over the splendid New Hampshire roads in the White Mountains was an ideal one. It comes pretty near being the most picturesque automobile touring district in the United States. Comfortable inns and convenient garages are frequent. The ride through Franconia Notch over magnificent State roads was glorious. At the Profile House, mine host, C. H. Greenleaf, was on hand with a bowl of mountain-dew punch. At Bretton Woods the tourists were welcomed with characteristic warmth by their old Ormond friends, the Anderson and Price outfit, who had thrown open the Mount Pleasant Hotel abnormally early.

The tourists lay over at Bretton Woods on Tuesday and left for Poland Springs on Wednesday. They were met at Allen's Corners by a welcome delegation of the Portland Board of Trade and tendered a reception on their arrival at the Maine metropolis.

To-day's journey will be to Portsmouth, N. H., 81 miles; Friday's, to Boston, 68 miles; Saturday's, to Waterbury, 157 miles, and Sunday's, to New York, 101 miles.

Drawing the Lucky Number "129" from the Box.

ANNUAL REUNION OF METROPOLITAN OLDSMOBILISTS

NEW YORK, June 22.—Oldsmobilists of the metropolitan district had their third annual reunion last Saturday. The Columbia Cricket Club oval at Williamsbridge was the scene of this year's outing. In the parade up Broadway, past "Automobile Row," over 200 Olds cars were in line. By actual count, 176 owners of Oldsmobile cars had been regularly entered, and were thus entitled to take part in the drawing for the choice of a \$3,000 palace touring car or a gentleman's runabout.

The founder of these reunions, which began in 1906, and have become a feature of the sport each year in the New York district, was Gen. John T. Cutting. The first two outings were held at the Empire City track and had racing for a feature, though, of course, the chief attraction has always been the prize drawing for an Oldsmobile, donated by the Olds Motor Works.

The preliminary parade started from the Olds agency, at Broadway and Fifty-first street, at half past eleven o'clock. It was headed by the Old Guard band in a big Packard truck. To the inspiring and oft-repeated strains of "My Merry Oldsmobile," the procession moved out Broadway amid the hearty cheers of "Automobile Row." In line were Olds cars of every type and vintage from the stately palace touring car to the curved dash runabout of days gone by. Of the latter there were close to two score. Some of them bore signs telling of mileage well up in the ten thousands. Some were gay with fresh paint. Others were dingy from wear and a bit slow in pace from overwork these long years. The procession made a brave showing, stretching for more than a mile along the Great White Way.

Arrived at the Oval, the cars lined up two deep along the running track. Lunch baskets were opened and on all sides was al fresco picnicing. Then came the ball game between a nine of

Oldsmobile employees and a team of automobile pressmen. All were in neat gray uniforms, just like real ball players, and it was a sight to see veterans of the "Senator" Morgan, "Jonah" Wetmore and "Pop" Ward vintage bravely cavorting around the diamond as youngsters of the Horner, McAllister, Hardy and Giegerich type. "Wag," as umpire, did his best for the scribes, but they lost 12 to 7, after five bone, muscle and nerve-racking innings, which left an aftermath of bruised shins and stiff joints over Sunday.

Then came the drawing. The lucky number was "129." L. L. Schmidt, a Hoboken hardware dealer, who had bought a 1908 Oldsmobile touring car in January, was its holder.

The occasion was one that will long be remembered by the customers of General Cutting, and his many friends, who were fortunate enough to be present.

BRIEF DOINGS FROM THE TOWN OF TIRES.

AKRON, O., June 20.—The Diamond Rubber Company, of this city, is furnishing a large proportion of the tires for the Fire Department of New York City. At present the local company is filling orders for 26,000 pounds of tires for the metropolis, which represents all but 4,000 pounds of the annual requirements. The first order was received by the Akron company some time ago for 14,000 pounds, and a second order for 14,000 pounds was received June 10.

J. R. Bailey is representing the Diamond Rubber Company, and M. S. Johnson the B. F. Goodrich Company at the annual convention of the Master Car Builders' Association at Atlantic City this week.

The Contending Ball Teams and Multitudinous Array of Oldsmobiles, Were Lined Up in the Background.

AUTOGENOUS WELDING IN AUTO CONSTRUCTION*

By E. S. FOLJAMBE, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

IN dealing with the possible application of autogenous welding to the construction and repairing of automobiles I fully appreciate that the subject is so comparatively new that its practical field of usefulness has not yet been clearly and definitely defined. It would seem from the applications of the process and the extensive experiments which have been carried on abroad and are now being conducted by a few in this country that autogenous welding supplies the workers of metal a means of accomplishing many results which have heretofore been either impossible or only achievable by costly and difficult methods.

This process consists of welding, or, more correctly speaking, melting together metals by means of the oxy-acetylene flame, the temperature of which almost rivals that of the electric arc, being 6,300 deg. Fahrenheit. The facility with which it can be handled as compared with most other methods makes its com-

Fig. 1.—Section of Fouché Welding Burner.

mercial application comparatively simple. The possibilities attendant upon the use of a flame of such high temperature can be realized when it is remembered that the melting point of steel is about 2,570 deg. and that of platinum, one of the most refractory metals, is only 3,227 deg. F. Its chief field of usefulness is in combining such metal parts as would ordinarily be riveted, in welding small parts together, in repairing broken or defective castings and for cutting metals.

Concerning the Work of Fouché.

Unquestionably the combination of acetylene and oxygen was first suggested by the familiar oxy-hydrogen blow pipe, but it was only after exhaustive experiments on the part of the noted French chemist Fouché that, in 1901, he was enabled to produce a successful burner using this highly explosive combination. He was led to use these two particular gases by his calculations which showed the extremely high temperature that would be generated by their union. In 1902 he patented his first cutting and welding burners. In 1905 he took out additional patents, and Fig. 1 shows a section of this later welding burner, the principle of which has not up to the present time been appreciably altered or improved. Since his introduction of a successful burner the development of the oxy-acetylene process has been principally in connection with the best and most inexpensive methods of producing these two gases.

Details of the Burner Employed.

The most economical method of producing oxygen in commercial quantities is by means of distillation of liquid air, the cost having been reduced to something less than a cent per cubic foot. However, the familiar laboratory method of heating Black Oxide of Manganese (MnO) and Potassium Chlorate (K₂ClO₃) is largely used in this country, on account of the relatively low cost of the plant, although oxygen produced in this manner can hardly be sold for less than two cents per cubic foot.

The principal difficulty in designing a burner is to prevent the

flashing back of the flame at the nozzle, which might cause an explosion. Even several wire screens have been proved ineffectual preventives, as the intense heat of the flame instantly raises the fine wires of the screen to a red heat. The method employed by Fouché consisted either in using a small bore tube of great length coiled into the cylindrical part of the burner, A, Fig. 1, or of packing this space with mineral wool or asbestos, through which the gas could freely pass, but which successfully prevented the firing back of the mixture. As the tube is not of capillary size, it causes less resistance to the flow of the gas than the asbestos, and is therefore preferable. In a welding burner oxygen under about ten pounds pressure per square inch is admitted through the small tube B, and after passing out of a fine tipped nozzle, C, mixes in the injector-like chamber, D, and carries along with it the acetylene which has passed through the coil in cylinder, A. The mingled gases burn, but beyond the tip, E, due to the pressure, so the tip itself is not subjected to a high temperature, and can be made of brass or even copper. In the welding flame the acetylene is only under a pressure of three-quarters to two pounds per square inch, and the oxygen, ten pounds. For cutting, the same combination flame is used, but in addition a third tube for pure high pressure oxygen is provided, and so located that the oxygen strikes the heated metal just to the rear of the combination flame. The oxygen for the cutting burner is under about 150 pounds per square inch, and the acetylene 10 pounds.

How the Burner Is Operated.

In operating the burner the acetylene is first ignited and the flame regulated by means of a valve at the end, so that it does not leave the tip. The oxygen is then turned on, the pressure being maintained constant by means of a reducing valve on the tank. The acetylene is then regulated until just sufficient to produce complete combustion, giving practically a non-luminous flame in the middle of which, however, near the tip, a slightly luminous cone is seen, the point of which is the hottest part of the flame, and the burner is usually held in such a position that the tip of this cone touches the work. If an excess of oxygen is present the metal will very soon scintillate, showing that it is being burned. This, of course, has reference to the welding flame alone, as the cutting action is entirely due to an excess

Fig. 2.—A, pressed steel forming a cup, showing rough-welded and finished edges. B, steel, copper and brass tubing welded together. C, thin copper tube made from a sheet. D, cast iron pipe cut off at ends by the flame, the width of the cut, which is about 1-8 inch, being shown at 1. E, two strips of 1-8-inch sheet steel welded and twisted. F, section cut in 17 seconds from the end of a 2-inch bar of high carbon steel. G, spoke made of two pressed steel halves welded together. H, finished spoke.

*Paper read before the Society of Automobile Engineers at Detroit, June 25, on the occasion of the third annual summer meeting of the society. The reading of the paper was accompanied by an actual demonstration of the various processes described, the apparatus for the purpose being supplied by the American Ferrofix Brazing Company, Philadelphia, Pa., to whom the author is also indebted for some of the data.

of oxygen, which causes the metal to burn at a very rapid rate. The extreme localizing of the heat makes it possible to use the flame in close proximity to soldered or brazed work without causing a separation of the parts thus united. On certain classes of work where it is desired to make an ordinary brazed joint the flame can also be used to advantage in heating the parts and melting the spelter.

Method Employed for Cutting.

When cutting, the combination flame is first turned on and used to bring the edge of the piece of metal to be cut to a bright red heat. Then the pure oxygen stream is turned on and the highly heated metal instantly combines with the oxygen, forming Fe_3O_4 in the case of iron, and a path is almost instantly melted out as the flame is moved across the piece. The amount of metal burned away depends upon the width of the zone heated by the fore flame and the volume and pressure of the oxygen. The complete localizing of the heat is a peculiar and surprising feature, for although the metal for about an eighth or three-sixteenths of an inch is actually running out of the cut like water, the adjacent metal is not heated to a dull red for more than half an inch on each side of the cut. For cutting thin metals, oxygen under such high pressure is not as essential as when the work is thicker, and it has been found that after the melting process caused by the pure oxygen stream has started, it is almost unnecessary to have the combination flame carried ahead of the stream of oxygen, as the heat is so intense that the action after once started can be continued. This has been shown by using simply the flame from a welding burner to heat the edge of the piece to the melting point and then suddenly turning off the acetylene, allowing the oxygen jet alone to impinge upon the heated metal. This is rather difficult, however, for if at any time the metal cools even slightly below the welding point, the oxygen acts as a draft to cool it, and the melting ceases.

Its Application to Welding.

In uniting the edges of a sheet rolled to form a cylinder, or wherever the pieces do not lap, the edges are beveled so that when brought together a V-shaped groove is formed, the width at the top of the groove being about the same as the thickness of the metal. This rule applies to metals up to half an inch in thickness. The flame is directed into this groove, first melting the thin bottom edges; at the same time a piece of wire of the same material as that of the parts to be joined is held in the edge of the flame and thus kept at a bright red heat until the metal of the parts begins to flow, when the wire is immediately plunged into the flame, and being instantly melted, drops into the groove, uniting with the metal at the bottom. This process is continued, thus building up the metal until slightly more than sufficient is placed in the groove to fill it, so the piece can afterwards be dressed to make the surface of the joint flush and invisible. Even dissimilar metals can be perfectly united, and such combinations as copper, brass, cast or wrought iron to steel, or brass to copper, are possible. Aluminum can also be worked successfully. See photograph, Fig 2. The parts so united form one homogeneous piece, but with this distinction that, while the metal of the original sheets has a grain due to rolling, the built-up material of the joint has a structure similar to puddled metal. This is probably one reason why test specimens do not show a tensile strength equal to that of the original. However, as shown by the following report of the South Chester Tube Company on wrought iron pipe material welded by the American Ferrofix Brazing Company, the relative strength is very high, being about 95 per cent. of the original piece, which is much higher than can be obtained by riveting. It is even possible to increase this to 100 per cent. by simply heaping up the metal at the joint until the cross sectional area is somewhat larger than that of the original, but the elongation is noticeably decreased. However, the results shown by the appended table demonstrate in a striking manner what is to be expected of the new process. The following is the report of the experiment:

REPORT OF SOUTH CHESTER TUBE CO.

No.	Original bar.....	Ultimate Strength	Elongation	Elastic Limit
No. 1.	Original bar.....	49,580 lbs. sq. in.	11%
No. 2.	Welded bar.....	43,040 " " "	5%	38,700
No. 3.	Welded bar.....	46,600 " " "	8.5%	35,800

Operations to Which It Is Adapted.

Although the cutting-off flame is of especial interest, its applications to automobile construction are much more limited than are those of the welding flame. In Paris, the flame has been used successfully on work as large as six inches in thickness, but so far as I am aware no cutting has been done in this country on work over 2 1-2 to 3 inches thick. However, the burners are daily being perfected and it is probably but a question of a short time when plates of a considerable thickness can be successfully cut. Although the intense heat of the flame has a slightly injurious effect on the alloyed steels, particularly if applied to sheet metal or comparatively thin work, still it is possible to rapidly cut out gear blanks, without injuring the metal to any considerable depth. It seems perfectly feasible to assume that when it is desired to form crankshafts from a slab or billet, it is possible to do this with the cutting flame in a very small fraction of the time now consumed by those few makers who employ the slab method.

The chief interest, however, of the oxy-acetylene process at present is confined to welding, which can be used in innumerable ways in connection with the construction of automobile frames and engine parts. It is probable, for example, that nearly all of the riveted joints in frame construction can be eliminated, and the pressed steel cross frame members, gusset plates and sills be united by the welding flame, so as to form practically one solid piece. Pressed steel, drop-forged or wrought iron step hangers, brackets for jack shafts, springs, guards, etc., can be neatly and readily made one with the frame. Drop-forged or cast steel spring horns can be firmly united to the pressed steel side members of the frame, and whatever cracks or unsightly joints might ordinarily be left, these can be completely filled and dressed off, making a much more finished job than by the usual methods.

At the same time the structure is materially strengthened. Many parts such as steering arms, pedals and levers, which are now either pinned and brazed, keyed or screw and nut retained, can be made to form one solid piece by a brief application of the welding flame. Parts which require mild steel centers but should have high carbon steel rims, as in the case of gears or gear sectors, can be built up by the use of this process. Brass handles can be joined to steel shanks, or brass heads be put on screws which need steel shanks for strength. Nickel steel or cast iron valve heads can be attached to carbon steel stems, and many other possibilities will suggest themselves to the minds of those actively engaged in automobile construction. I do not state that all these suggested uses will be found more economical than bringing about the results in some other way, but these are matters which will adjust themselves in practice. In the construction of radiators and tanks and the attaching of pipes to similar or dissimilar metal tanks, the oxy-acetylene process will doubtless find large application, as by this means absolutely seamless tanks can be formed which are actually stronger at the united edges than at any other place, owing to the filletting with additional metal.

Suggested Improvement for Auto Construction.

Automobile construction has shown a steady but gradual increase in the use of pressed steel parts, and it is but natural to suppose that by means of such a process as autogenous welding, the applications of pressed steel will become even more numerous. Already in Germany, patents have been granted for making light crankshafts from two similar pressed steel halves, united by the oxy-acetylene flame, and attempts have already been made to form axles in a similar manner, but I believe thus far the work has only been of an experimental nature. The following is a suggested method of forming a light pressed-steel piston. The walls of this piston consist of a rolled up sheet of metal, grooves or depressions for the piston rings in the same being produced by dies or rolling, while the free edges are

united by the flame. In the same way a disc head, which may be drawn to form a convex surface, and also drawn bosses, can be welded in place, giving an extremely light, rigid construction. Of course, it is understood that a slight amount of turning and finishing of piston ring grooves, holes for the wrist pin, and external grinding will be required. Light, stiff pressed steel connecting rods could also be made in a somewhat similar manner.

Extensively Used for Repair Work.

As it is possible to unite many dissimilar metals, and with a heat so localized that neighboring parts are not affected, autogenous welding has already found extensive application in automobile repair work. Broken crank cases or other parts can be

Fig. 3.—On the right is a view of an operator welding a spoke, and on the left is an aluminum gear case, the entire portion of which at X above the black line was built up from a bar of aluminum, thus providing an inexpensive method of remedying what has all along constituted one of the most costly items of maintenance to the autoist, replacing gearboxes and crankcases.

united and made practically as strong as new. The method of holding the pieces of a broken aluminum case, for example, is to clamp them into position temporarily while clay is packed around the parts and heated sufficiently to drive out the moisture, thus forming a solid support for the parts as well as a kind of mould. A series of holes are usually drilled at the crack, or the edges of the pieces are roughly beveled so, as previously explained, the metal can be built up from the bottom. In some instances lugs or peculiar shaped projections may have been completely worn off or destroyed when it becomes necessary to build up new ones with additional metal. A repair of this kind is shown in Fig. 3. In repairing a cracked water jacket, after the edges of the crack have been prepared, it is customary to use copper instead of iron wire for the filling metal as it flows at a lower temperature and adheres very positively. In case there is danger of warping, due to local expansion, the entire cylinder is heated before operating upon it. This preparatory heating process is also used on large parts, whose mass is sufficient to conduct away the heat so rapidly that it would otherwise be impossible with a flame of ordinary size to bring the parts to the melting point. In fact, the heat conductivity of large masses of metal is really the limiting factor in determining the size of work upon which the flame can be employed. Defective castings which ordinarily would immediately be consigned to the scrap heap can be made as good as new. Blowholes and other imperfections in large work can be easily filled, either with iron, brass, bronze or aluminum, according to the nature of the casting. With such a process perfected, there is almost no excuse for any metal part of a machine being discarded, whether in the original process of manufacture, thus eliminating much of the expense due to "wasters," or after a car has suffered an accident, avoiding the cost of high-priced replacement parts.

Comparative Cost of the Process.

The cost of oxy-acetylene autogenous welding depends, of course, upon the size of the work, the price of the gas, and in no small degree upon the skill of the operator, so that very little can be definitely stated in regard to it. It is claimed that the expense of uniting sheet metal can be compared with riveting as follows: up to 1-4 inch in thickness it is cheaper than riveting; 1-2 inch about the same, while above 5-8 inch it is more expensive, the cost increasing approximately as the cube of the thickness.

The time required for cutting different thicknesses of metal from experiments made by the Baltimore and Ohio R. R. Co. is as follows:

CUTTING RECORDS.

- A section 13 1/2 inches was cut from a 1/2 inch flat in 1 min. 10 sec.
- A section 12 inches was cut from a 3/4 inch flat in 1 min. 25 sec.
- A section 12 inches was cut from a 3/4 inch plate in 2 3/4 min.
- A section 33 was cut from a 15 inch x 50 lb. beam in 3 min.

The consumption of acetylene and oxygen by burners suitable for different thicknesses of metal are given in the appended table:

No.	Acetylene	Oxygen	Thickness of Metal
No. 1.	100 litres 3 1/2 cubic ft.	4 1/2 cubic ft.	1-32 in. to 1-16 in.
No. 2.	150 litres 5 1/4 "	7 "	1-16 " 3-32 "
No. 3.	225 litres 8 "	10 1/2 "	3-32 " 1-8 "
No. 4.	350 litres 12 1/4 "	16 1/2 "	1-8 " 1-4 "

For 3-4-inch metal a special tip of a capacity of 52 feet or 1,500 litres of acetylene and 71 feet of oxygen is required.

FACTORY TESTING OF AIR-COOLED ENGINES.

Not the least important item in the manufacture and marketing of an automobile to-day is the testing of the motor before mounting it on the chassis and the progress that has been made in this field has kept fully abreast of improvements in design and construction by those progressive manufacturers who will not let a car leave their works until certain that it has tested right up to the mark they have set for their product. An instance of this is to be found in the new dynamometer testing plant recently installed by the Oscar Lear Automobile Company, of Springfield, Ohio, builders of the Frayer-Miller air-cooled automobiles and trucks.

The apparatus consists of several stands upon which any size of engine may be mounted and one upon which is hung a Sprague dynamometer. This machine is ball-bearing, has its fields separately excited, and when loaded by means of a water rheostat near by gives an absolutely exact reading of the torque exerted by the engine expressed in pounds. A Schaeffer & Budenberg tachometer set on a stand next to the dynamometer and belted to it registering the number of revolutions. A chart on the wall then enables the operator to read the exact horsepower delivered by the engine. The dynamometer is so wired that it may be run at first as a motor to start the engine and is then converted by throwing the switch into a dynamo. All computations are checked up by a voltmeter and ammeter on the switchboard.

The apparatus also includes a Schultze manograph, imported from France. This delicate machine transfers to a photographic plate an indicator card for each cylinder. These on being developed will immediately show any defect in the engine such as loss of compression, poor firing or bad mixture, etc. The process is one of exceptional interest to the mechanically bent layman, as well as to the experienced engineer. These tests are rigidly carried through at all times and it is safe to assume that when an engine is delivered from the test room that it is not far from being all right.

View of the Frayer-Miller Testing Plant.

A POINTER ON REPAIRING BROKEN PARTS*

WE all must admit that the machines of to-day are far superior in quality to those of former years. Some of us, when starting out for a certain point, are cocksure to get there at a certain time, others reasonably so, and still others are mighty glad if they get there at all. The fact that a good many more now reach their destinations than in former years is, no doubt, largely due to the fact that we have better cars. The manufacturers have learned by experience to proportion the different parts so as to better withstand the severe strain and wear to which they are subjected. Owners and chauffeurs also have benefited by experience, and handle and treat the cars to better advantage and with more consideration.

But one main reason why we have better success with our autos is due to the fact that better materials are being put into the running gear and the motor. For these better materials we are indebted to the scientist, who is forever and persistently searching into the unknown. For instance, when speed is wanted, friction in the running gear being objectionable, ball bearings were resorted to. When the balls in that bearing were found to break too often, rendering the bearing impracticable, somebody spent years and hundreds of thousands of dollars to find a steel for that particular purpose, and by the assistance of the metallurgist succeeded. While their particular steel would answer for ball bearings it was not at all suitable for other purposes, where tensile strength together with great elasticity or high vibrating break limit was required. Some other fellow with a long head gets to work and produces a nickel-steel, another with perhaps still a longer head brings us chrome-nickel steel, and still another vanadium steel, etc. When we find that these, or at least some of these different, high-quality and very desirable materials are excellent for our purpose, but are very obstinate and resist being worked into shape and finished with our old-fashioned tools, another metallurgist looms up with still another steel which cuts the first named just as easily as if they were ordinary iron.

But in spite of all these good materials, we cannot and do not expect that none of them will not break by accident or otherwise. And here we find a chemist who has discovered a flame hot enough to melt broken parts together, uniting them into a stronger unit than we had before it had been broken. This last discovery we believe does prove interesting to the automobilist, and for this reason we wish you to know of it. We do not wish to be understood to say that all these improvements were made on account of the automobile, but we do believe that it has been a large factor in the furthering of science in the direction spoken of. Going back to the flame, it is the hottest ever produced, and the heat compares favorably, if it does not surpass, that of the electric arc. The pyrometer puts it at 6,300 degrees Fahrenheit. It is produced by the combination of oxygen and acetylene gas in the same manner as the oxy-hydrogen flame. It is also used in the same way as is the last named torch.

You have probably seen the storage battery maker use a torch with oxy-hydrogen gas in burning the lead terminals or connections between the several cells together. The oxy-acetylene torch produces, according to its size and the purpose used, a flame consisting of an outer mantle and the exceedingly hot but small and pointy inner core. When the core of this flame is played on to a piece of steel, cast iron or any other metal, the surface melts immediately under the terrific heat. The end of a steel wire or rod of suitable thickness (depending on the size of flame and job in hand) may be brought into the flame when it melts and flows on to the molten surface, and unites therewith thoroughly. In that manner cast iron, aluminum, brass, even steel and cast iron can be united. In case of a broken axle, steering knuckle or any other part where the pieces must be budded together

closely, the flame would not get into the break far enough to make a good job. In such a case the operator cuts enough material away so as to make a wedge-shaped opening, enabling him to melt both surfaces, adding steel to fill it up from the bottom and make a perfect weld. If the mechanic is an expert with the torch he will succeed in uniting the broken part and heating it to a red heat not further than perhaps one-half of an inch distant from the break, so that a hole or screw located within that distance will not be disturbed, and a pin or nut fitting such hole or screw previous to the breaking will do so after the repair has been done.

Not only the steel parts can be repaired quickly and effectively, but the aluminum crankcase, as well as a cylinder, a lug or any other part, which, although inexpensive cannot be obtained quickly, can be made good quickly and satisfactorily.

The writer has seen quite a number of repairs so made. One, for instance, was a front axle on which the lower member of the fork receiving the steering axle was broken off. A new axle meant an expense of about \$75. It was repaired with the flame in less than an hour, and cost \$2.50. The thread in the hole, less than three-quarters of an inch away from the break, received the screw without difficulty. The axle is just as good as it ever was, and a little stronger in the place where it had been broken.

Another but less serious case was the breaking in two of a malleable iron exhaust elbow casting. A new elbow could have been bought for \$1.50, but it not being in the stock of the agents, a delay of ten days was probable. One dollar paid for the welding of it and it was none the worse for looks.

Your committee has reason to believe that the knowledge this article is intended to impart, meager as it may be, will prove of interest and perhaps of real value to at least some, who are so enthusiastic of our machines and their mechanisms that the automobile is the first, the intermediate and the final subject of conversation whenever we meet.

EDITOR'S NOTE.—Evidently Mr. Weiss and his fellow members of the Technical Committee of the Long Island Automobile Club have had occasion to see some of the results of autogenous welding, which is described more at length in this issue, in the shape of a paper read before the Society of Automobile Engineers at Detroit.

THE "FRAME" RETURN A SOURCE OF TROUBLE.

One prolific source of faulty running lies in the frame return; there is no real advantage, says *Motor* (London), gained from it. On the contrary, bad connections can often be traced to it. There is only one correct way of arranging the return circuit, and that is to run an insulated wire from the metal cover of contact maker direct to switch. It is not good enough to attach the wire to a screw or bolt on the engine, as is sometimes done; the connection should be made direct to the contact sector. A well-designed contact device will always have a spring terminal provided for the purpose. In cases where the switch is fixed on the steering wheel it is just as easy to run two wires as one. If the return is intrusted to the steering column and the gear, the latter always in a more or less insulated condition with thick grease, it must be obvious that a very unreliable circuit must exist. Regarding the running of wires up the steering column, this is often done in an unsightly and unworkmanlike manner, the wire generally being tied on with adhesive tape. The method I would adopt would be to run the wires in a piece of polished brass or plated flexible tube neatly fixed on the steering column with clips. I recollect completely curing a very bad case of misfiring on a large four-cylinder car by temporarily joining the cover of the contact maker by means of a piece of flexible cable, later on substituting a permanent return to the switch. Previous to this the firing had been very "jumpy."

*Paper presented before the Long Island Automobile Club by the Technical Committee.

LETTERS INTERESTING AND INSTRUCTIVE

EFFECT OF WHEELBASE ON SKIDDING.

Editor THE AUTOMOBILE:

[1,433.]—I understand that a lengthened wheelbase is an advantage in that it provides more room, greater comfort for the passengers by having the seats between the two axles, and also contributes greatly to the ease of steering. I contend that it is also an advantage in that it tends to lessen skidding. My contention is based entirely on personal experience in handling short and long wheelbase cars, but a friend holds the opposite view, and while each of us has advanced a great many reasons why it should or should not be so, I have been unable to arrive at any definite conclusion as to the cause, though none of the arguments of my opponent have been sufficient to shake my faith in the belief that the long wheelbase car does not skid as badly.

Can you confirm my experience on this point and explain just why this should be so?

G. F. VALDEZ.

Colorado Springs, Col.

The long wheelbase car does not have such a decided tendency to skid or side slip as does its predecessor that was much shorter, so that the results of your observation in the matter are quite correct. Nor is the modern car afflicted with a far worse habit that the very short car of former days was subject to—that of spinning around on a greasy pavement when suddenly brought to a stop. The nearer to the center of the parallelogram marked by the four points of contact with the ground represented by the wheels that the weight is carried, *i.e.*, the mass or center of gravity of the weight of car, the less effect will it have in accentuating any tendency to slip. When the rear wheels slide around, as is usually the case when a skid occurs, the pivot of the lever around which the end of the car revolves, may be taken as the center of the front axle. Once the car starts to slip in this manner, it is evident that its momentum tends to keep it going in the direction in which its force has been diverted, and as is the case with a pendulum, it is obvious that the point at which this force is applied will determine the extent of the effect it will have in slewing the car around. That is, following out the simile of the pendulum, if the force be applied to a weight on the end of the latter, the lever will tend to swing violently. This is the case of the short wheelbase car in which the center of the mass of the weight was often near the rear axle, while the modern long wheelbase car can be compared to a pendulum the weight of which has been moved up to the center of the lever.

INDICATIONS OF AIR VALVE TROUBLE.

Editor THE AUTOMOBILE:

[1,434.]—Please advise through "Letters Interesting and Instructive" what my trouble is. I think it is in the Schebler carbureter that I am using. It never gave any trouble in two years, but now something must be out of order. When I open the throttle slightly, the motor responds promptly; when the throttle is opened in full, the motor slows down and I have a loss of power.

F. EDW. RUNGE.

Burlington, Ia.

Failure of the motor to respond to the throttle is doubtless one of the most exasperating forms of trouble that is to be met with in running a car. It is usually caused by an over-rich mixture brought about by a failure of the auxiliary air valve to open in accordance with the opening of the throttle so that the mixture which was satisfactory at low speeds becomes surcharged with gasoline, often in a more or less liquid state, due to the greater suction at the nozzle, which is not compensated for by a correspondingly greater amount of air. To test this, fasten the auxiliary valve of the carbureter wide open, or remove it altogether. Cover the opening with a piece of cardboard and move this improvised slide back and forth to correspond with the opening of the throttle, and note the effect on the motor. A little experimenting of this kind should suffice to reveal the cause of the trouble and the remedy should not be difficult to apply.

DO AUTOMOBILE FLYWHEELS EVER BURST?

Editor THE AUTOMOBILE:

[1,435.]—In big steam engines and power plants a more or less common form of accident that usually does a great deal of damage when it does happen is termed the "bursting" of the flywheel. In other words, it flies to pieces, due to the effect of centrifugal force acting on the heavy rim of the wheel. Sometimes this takes place without any warning whatever and without any apparent cause, but usually it is brought about by the failure of the governor to check the engine when relieved of the load. The engine then begins to race, and unless the steam is shut off by hand it reaches a speed far beyond that which the flywheel is calculated to stand.

Now automobile motors are frequently raced and are often made to run light at speeds far beyond their normal rating. I would like to inquire if cases in which the flywheel has flown to pieces in the same manner common in large stationary engines have come to light, and if this is really not a danger which should be guarded against by not allowing the motor to greatly exceed its usual rate.

CENTRIFUGAL.

Montclair, N. J.

So far as we know, there is only one case on record in which an automobile flywheel is known to have burst in this manner. The accident occurred to a Decauville car in Long Island City a little more than a year ago and resulted fatally to the passenger sitting beside the driver, a ten-pound piece of the rim of the flywheel coming up through the floor. The car had been stopped and the engine was about to be stopped, so it is to be presumed that, in accordance with the usual custom, it was being raced preparatory to the current being cut off. Doubtless it was due to a flaw in the casting. The custom of racing the motor is to be condemned under any circumstances, but this is the only case that has come to our knowledge in which it has resulted disastrously.

ABOUT THE ECONOMY OF THE TWO-CYCLE.

Editor THE AUTOMOBILE:

[1,436.]—As the two-cycle engine makes an explosion every revolution, does it not use more gasoline in traveling a mile than the four-cycle engine of same horsepower? Doesn't it use up more batteries?

The Thomas-Detroit has an engine with a bore of 5 inches and stroke of 4.3-4 inches and is rated at 40-horsepower under the A. L. A. M. rating. If another engine had the same size bore and 5.1-4 inches stroke, would it not produce more horsepower? If this is so, the A. L. A. M. rating is not very accurate.

In what race, such as the Vanderbilt and Grand Prix, has Lancia won? In what races has he come in second during the last four years.

A CALIFORNIAN.

Newman, Cal.

The two-cycle engine does use more fuel than the four-cycle, as outlined in the answer to Letter No. 1,421 in last week's issue of THE AUTOMOBILE. The greater consumption is not so much due to the fact that the two-cycle motor makes an explosion for every revolution, in contrast with the missed stroke of the four-cycle, as it is to the fact that there is considerable retention in the cylinder of the exhaust charge, and that, despite the deflector, more or less of the fresh charge escapes at the exhaust. The two-cycle is also harder on a battery owing to the greater frequency of the demands upon it, but with improved methods of ignition, even dry batteries have been found to give very satisfactory service.

The A. L. A. M. formula is not intended as a means of arriving at accurate results in figuring horsepower, and it must be evident to anyone who has given the subject a thought that this would not be possible by any such simple means. The idea has been to make the matter as plain and easy as possible for the layman; in other words, it is a formula for "popular consumption," so to speak, and is not expected to give more than approximate results. It is based on a piston speed of 1,000 feet per minute, and it is said that the denominator, *i.e.*, 2.5, which is employed as the

divisor of the product of the square of the diameter of one of the cylinders, times the number of cylinders, has been arrived at as the average shown by a number of representative American motors.

We do not know that Lancia has ever won any of the big road races, although his daring work has made him a popular favorite on every occasion. In the Targa Florio, September, 1905, he came in third; in the Grand Prix, June, 1906, he was fifth; in the Vanderbilt Cup race, October, 1906, he was second, and he also gained the same position in the Targa Florio of last year.

ABOUT REMODELING A LIGHT SINGLE-CYLINDER.

Editor THE AUTOMOBILE:

[1,437.]—I have a single-cylinder 6-horsepower runabout, weight 1,000 pounds. Do you think I can improve my car by putting in a double-opposed 6-horsepower motor? Would it cause less vibration? The vibration is what I want to stop as much as I can; as it is now, the vibration shakes things loose. The car runs about 15 miles an hour on high gear. Would it improve it to lengthen the wheelbase, which is 66 inches? Is 6-horsepower sufficient for a car of 1,000 pounds, or should I have a 10-horsepower motor? Is the Bellfus 10-horsepower double-opposed air-cooled motor O. K.?
JOS. SYLVESTER.

Jamaica, N. Y.

Six horsepower is very little for a 1,000-pound car, as cars weighing 2,000 to 3,000 pounds usually have five to six times that much. It would hardly be worth while to simply change the type of motor, except that the vibration would not be so great. The shaking caused by a high-speed, single-cylinder vertical motor is naturally excessive and the installation of a double opposed motor, which is not only very much better balanced, but also runs much slower, would be a great improvement on this score. We doubt if motors of the double opposed type are made as small as six-horsepower. Lengthening the wheelbase would also be found a great improvement, but in order to get the best result it would be necessary to add 30 to 40 per cent. to its original length as the latter is extremely short—in fact, we thought the low limit in wheelbase lengths was 72 inches for anything built within the last five or six years. A 10-horsepower motor would give very much better satisfaction than the present power plant. We have never had an opportunity to judge of the merits of the motor you mention. Before undertaking the work of rebuilding your car, which is what the proposed changes will amount to in the end, we should advise you to count the cost carefully, at the same time bearing in mind that the result will not be a new car by any means, although the amount spent on the reconstruction process might be almost sufficient to pay for a new car of much better make.

ABOUT UNIVERSAL JOINTS AND COUPLINGS.

Editor THE AUTOMOBILE:

[1,438.]—In reading over the specifications of new cars I note that the description sometimes states that one or two universal joints are employed on the driving shaft. At other times it is referred to as a "coupling." I would like to know if there are not a number of types of universal joints and if the term "flexible coupling" is used to indicate a different kind of joint altogether, or is merely another name for universal joint. Also, what is a "telescope joint."
READER.
Savannah, Ga.

There are quite a number of different types of universal joints and they play an important part in the driving mechanism of an automobile. Some of the better known are the Oldham type, consisting of three parts, such as two hubs with circular flanges, to be fastened to the adjacent ends of the shafts to be joined, and a third in the shape of a disk between them, this last being provided with tongues fitting in the grooves of the flanges; another simple joint is the Hooke, the shafts to be connected having forked ends secured to the four arms of a center cross. Besides these, there are probably a score or more of well-known types of universal joints, many of which are covered by patents here

and abroad. In the sense that they are used with reference to the automobile in this connection, the terms universal joint and flexible coupling are practically synonymous. In fact, it is quite customary to refer to the first-named as the Oldham coupling, and it is better known by that title than the other. A slip joint is a totally different device that is usually used on shaft-driven cars in order to provide for movement that cannot be compensated for by the employment of a universal, *i.e.*, longitudinally in the same plane as the shaft itself. When standing, the distance from the rear axle to the forward universal on the shaft is a fixed quantity, but due to the flexure of the springs or the dislocation caused by striking severe bumps, this distance is often lessened to the extent of an inch or two, and the slip joint is designed to provide for this. The shaft is usually made square for four or five inches at the end intended to form the joint, and this squared section fits into a corresponding square recess in the other end of the shaft. It will be evident that the two ends of the shafts may thus move relative to one another without affecting the drive. This is usually known as a slip or telescope joint.

DIFFERENT METHODS OF VALVE PLACING.

Editor THE AUTOMOBILE:

[1,439.]—Can you tell me how many different methods of valve-placing and operation there are in current use on different automobiles? What are the advantages and disadvantages of some of them, as, although I have only had an opportunity to note comparatively few, it seems to me that the matter is one that is susceptible of a great deal of variation, and doubtless this has been indulged in at one time or another by different designers.

FOUR-CYCLE.

Shenandoah, Pa.

There are probably a dozen or more distinctive types of valve-placing and operation, most of which are to be found embodied in the design of one or more well-known motors. Among these, the commonest are what are termed the "T" and "inverted L" types, the valves being placed directly opposite in the former case, two camshafts being employed, while all are on one side under the foot of the L in the other, and are operated by the same camshaft. Then there are valves in the head, operated by one or two camshafts along the base, or by one superimposed camshaft, each of these methods naturally being subject to various modifications. Two methods which differ radically from any of the above are the concentric type in the head and the type in which the valves are set horizontally facing one another in a vertical pocket extending from the cylinder, two air-cooled engines being built in this manner, the Frayer-Miller and the Cameron, while the concentric type mentioned is also a distinguishing characteristic of a well-known air-cooled motor, *i.e.*, the Franklin. As already mentioned, there are also a number of other types, though the majority of them are simply modifications and not distinctive arrangements.

Advantages are claimed for each different arrangement by its designer, but it would require too much space to go into these. It is generally conceded that a valve arrangement which permits of designing the combustion chamber with a minimum of surface exposed to the heat of the burning charge, and which allows the most direct ingress and egress of the fuel and exhaust, will show the highest efficiency.

A POINTER ON CHANGE-SPEED GEAR SETS.

Editor THE AUTOMOBILE:

[1,440.]—From my observation I have come to the conclusion that where that most important factor of the transmission of power in an automobile is concerned—the change-speed gear, practice has resolved itself into a comparatively few standards. These are the selective sliding gear, the straight sliding gear, the planetary and the friction type. Leaving the last-named out of consideration, I should like to ask a few questions concerning the positive types: (a) What are the advantages of the selective over the usual straight or progressive type that was so commonly employed a few years ago, and (b) selective is so much better, why do not all makers employ it? I have been informed by some

drivers that it is only to be found on cheaper cars and that it is entirely a matter of cost, but my experience does not entirely confirm this, as I have known it to be used on high-priced American cars, such as the Packard. (b) Why is the planetary used on some of the lower-priced cars instead of the sliding type? In small sizes, is not the latter cheaper to build, and are there any other reasons why it should not be preferred? **GEARS.**

Buffalo, N. Y.

(a) The chief advantage of the selective over the progressive type of operation, is to be found in the fact that it is not necessary to pass through any intermediate gears in going from a higher to a lower speed, or vice-versa. Cost has been the chief factor in deciding against it where the medium-priced car is concerned, although this naturally does not hold where price is not an object. It is a much more expensive gear set to build than the straight sliding type. (b) Cost is here again the chief controlling factor, and while the planetary gear set may appear to be a more expensive construction it is quite the reverse. The pinions and gears are always in mesh and can be made of much cheaper materials, as they do not have to stand the shocks to which sliding gears are subjected. The case may be made of iron, instead of aluminum, and this makes considerable difference in the cost. The planetary is much better adapted for the use of the novice, as it is not so readily damaged and will stand a great deal of abuse that would put a sliding gear out of commission. It is not used on high-powered cars to any extent, owing to the fact that it does not lend itself readily to providing more than two forward speeds without undue complication and weight, besides which it is always more or less noisy on the low gear and quickly tends to become more so.

HOW LOW A GEAR RATIO IS USED?

Editor THE AUTOMOBILE:

[1,441.]—As a matter of curiosity I would like to ask just how low a gear ratio some of the old cars have used. One does not realize how great an improvement there has been in the matter of the relative speeds of the engine and the car until one of the oldtimers, by which I mean a car produced prior to 1904, is encountered on the road. On their low speeds some of these early cars have the motor running as if it would shake itself off the chassis, while the car is barely crawling. What is about the lowest gear ratio used now? **BARTON HADLEY.**

Boston, Mass.

Some of the oldtime cars must have had gear ratios as low as 16 or 18 to 1, on the lowest speeds, for as you say they raced their motors at a terrific pace to get up hills that now are scarcely noticed, while the car itself hardly maintained a pace that would be termed a dignified crawl nowadays. Naturally, the chief reason for this was to be found in the fact that their motors would not carry the load otherwise. We do not know definitely just how low a gear has been employed, but think the above does not overstate the matter. The lowest gear ratios are now to be found on light cars using a planetary change speed gear-set, and probably get as low as 12 to 1. Three and four-speed cars using sliding gears average 6 to 9 turns of the motor to one of the wheels on the lowest speed, or reverse.

MAGNETO IS SUPERIOR FOR IGNITION USE.

Editor THE AUTOMOBILE:

[1,442.]—Kindly inform me whether a magneto, when used on a four-cylinder car, gives more power and speed than a storage battery or dry cells. **E. K. SCHULTZ.**

Philadelphia, Pa.

It is a matter of common knowledge that the magneto, whether high or low-tension, is very much superior to a battery of any kind for ignition purposes on a four-cylinder car. Several years ago, before battery ignition systems had been brought to the point of development they have since attained, the difference between the two systems of ignition was very marked, and it was nothing unusual to find that a car had a speed of ten to fifteen miles an hour greater with the magneto. It is also much more reliable than the usual battery system and, once understood, is very simple.

FOR BRIGHTENING UP ALUMINUM.

Editor THE AUTOMOBILE:

[1,443.]—While aluminum does not become dirty or tarnished in the same sense that other metals do, it is noticeable that after a certain length of time it takes on a dull and unattractive appearance, and I would like to know if there is not some way of restoring it that is simple and easily applied. Doubtless some light on this matter would be appreciated by other readers, as well as myself. **B. J.**

A dilute solution of sulphuric acid and water applied with a brush will usually serve to effectually remove any foreign matter adhering to aluminum and will also give it a brighter finish, closely approaching the original.

SPARK GENERATOR FOR BATTERY CURRENT.

Editor THE AUTOMOBILE:

[1,444.]—We are somewhat frequently asked by intending users of our spark generator if it will take current from a dynamo or magneto instead of from a dry battery, and it seems worth while to call the attention of your readers to the fallacy underlying this idea.

As a matter of fact, it is scarcely possible to get satisfactory results from a dynamo or magneto thus used, the reason being that the contact made by the spark generator is of such exceedingly short duration that the armature has not time to "build up" a current before the break. A battery is a chemical apparatus, and chemical action has no "lag," whereas a reasonable, though small, time is demanded to set the copper and iron molecules of the armature in electrical vibration. The Atwater Kent contact maker is designed for battery current, and it closes the circuit only just long enough to permit the spark coil to "build up," with no armature lag added. We are unable to say just how long contact lasts, but we do know that by retreating the contact screw it may be so shortened that the spark diminishes from $\frac{1}{4}$ inch—its normal length—to $\frac{1}{8}$ inch, or to nothing at all. In other words, there is no waste contact time whatever, and the battery is drawn upon only to the extent actually demanded for spark production. Our statement that six dry cells, of the ordinary 6-inch or 25-cent size, will last for 1,500 to 2,000 miles, is meant to be taken literally as a safe statement of what may be expected. Many users report double that mileage. Incidentally, the erosion of the platinum contacts and all the other wear and tear, is as small in proportion as the current consumption.

In view of the fact that an outlay of three to six dollars for batteries will in reality carry the user of a spark generator through an average season, we think most of your readers will agree with us that the complication of an added dynamo or magneto whose current fluctuates with its speed and is nothing at all when the motor is at rest, is not warranted by the imaginary advantage to be gained. **ATWATER KENT MFG. WORKS.**

Philadelphia, Pa.

RESULTS OF THE HAND GRINDING JOB.

Editor THE AUTOMOBILE:

[1,445.]—I was glad to note the letter from W. J. B. S. which appeared as No. 1,387. He is partly right and almost equally wrong, for I did do the job of grinding by hand and got as good a fit as one would on a machine, but the job is no boy's play by any means and requires care and time. I used plenty of both. The engine is giving at least 50 per cent. more power now than it did.

As to removing the emery, he was sure right. I took all the precautions I could to get every bit of it out of the cylinders, but there is plenty of it there yet. I simply could not remove it all, and the result is, I will have to replace two crankpins and bush two crankpin heads. I have, so far, had to take the wear up in the cranks twice, but I am still trying to get rid of the emery and am pleased to know that, in time, I will be able to get rid of it all, as the wear is not near as marked as it was at first. As far as the pistons still wearing is concerned, I do not believe they wear very much, as Mr. Sparenburg cautioned me particularly not to grind too much, and I think he must have known that a little wear would take place when the engine was run and, in this way, they would wear down to the right fit, which seems to be the case, as the cylinders are getting tighter all the time.

I think this is a very good plan to grind old cylinders, but the emery is certainly a sticker, and I am still after it. In cleaning, I used gasoline, and was informed by an old engineman that I should have used kerosene, which I will try as soon as I have the engine down. I found that by putting graphite in the crankcase I got rid of the emery faster than any other way, as it would collect the emery and carry it to the bottom of crankcase when I could wash it out and put in new oil. After repeating this several times, I found it got rid of most of the emery.

West Liberty, Ia.

V. R. LANE.

PERFECTING THE SURFACES OF FRENCH HIGHWAYS

PARIS, June 17.—French roads, already reputed the best in the world, could be made perfect by the use of small granite paving stones on a concrete foundation where traffic is intense, by the tarring of all main highways, and generally by the use of harder stone than are now employed by the government road makers. The opinion is that of Dr. Guglielminetti, president of the Anti-dust League, and one of the greatest authorities on road making that Europe can claim.

The paved roads which Dr. Guglielminetti proposed have nothing in common with the old pavé which earlier centuries have handed down to modern France. The idea of authorities is to reopen these old roads to modern circulation by pulling up the old blocks, making a solid concrete foundation, then paving with smooth, closely fitting granite blocks. Such a surface is declared to be the ideal for intense automobile traffic, for it is practically dustless, has the maximum of resistance, and does not set up vibration. Naturally the first cost is enormous and it is for this reason alone that the improved granite road will never be generally employed in France. On most of the old highways running from Paris, however, it has been decided to remake the roads on this system. At present these roads are paved with large, uneven blocks having such a disastrous effect on an automobile that it is folly to attempt to run over them. The consequence is that the widest roads out of the city are neglected by automobilists; all the traffic is driven to the narrower macadam highways, which are unable to withstand the terrible strain. When these roads have been relaid Paris will have a set of out-

lets unequaled for fast motor traffic by anything in the world.

A very large amount of tarring is now being done on French roads, practically every village around Paris having undertaken to treat the highways in this manner. Thus on the main roads, where villages are close together, there are frequent stretches of ten miles of tar-treated roads; the roads from Paris to Versailles, carrying an immense amount of automobile traffic, and formerly as dusty as it is busy, has now been entirely treated with tar, with the result that even on a crowded Sunday afternoon no dust whatever is raised.

Where heavy traffic necessitates it the tar treatment has been applied even in the open country. The forest of Fontainebleau is an instance of this, some of the main highways through the forest being treated with tar for distances of ten to twenty miles.

One of the dustiest roads in France which has been perfected by tar treatment is the Corniche between Nice and Menton. Here during the busy season more than 500 automobiles pass in a day. Instead of a pestilence the highway is now a dustless boulevard. This southern stretch of road has been subjected to the severest possible strain, for the traffic is intense and fast and the material not of the best. It has been proved, however, that when the tar is applied on scientific lines it not only entirely removes the dust evil but gives a much more resisting surface. Where the tar treatment has failed in France it has been entirely through neglect to follow known rules in the treatment of the roads, and the process is now being carried out in a manner that leaves nothing to be desired.

TRACTORS SUPPLANTING MULES ON FRENCH CANALS

PARIS, June 17.—Although England has made some experiments with automobile barges on her northern canals, the honor appears to belong to France of first seeking to supplant the leisurely horse from the towpath of the inland waterways. The first tractor of this kind is employed on the Bourgogne canal connecting the River Seine with the Saone and thus linking up the Channel port of Havre with the Mediterranean naval station of Marseilles. The canal, which is 150 miles in length and has 189 locks, has up to the present been passed by means of teams of horses, four being employed for the trip, two resting on board while two are occupied in hauling. Under these conditions, the boats traveling day and night, the trip usually occupied four days.

As the towpath was in excellent condition, the experiment was made a short time ago by the Compagnie Générale de Navigation of supplanting one set of horses by an automobile tractor. The machine selected is a four-cylinder 10-horsepower Cottureau mounted on a special chassis equipped with metallic wheels. The

power is transmitted through a leather-faced cone clutch to a three speed gear box and countershaft placed to the rear of the axle, final drive being by means of side chains.

As a fully loaded barge weighs about 200 tons, the 10-horsepower motor is manifestly too little for starting such a vessel up from a rest. The rear wheels are ribbed to give increased traction, but even with this there is a considerable amount of slip before the heavy vessel can be got under way. Once moving, however, the automobile tractor has no difficulty whatever in maintaining a speed of five or six miles an hour, thus effecting a considerable saving over horse traction. An engine of about 16 horsepower would doubtless be better fitted to handle the heavy loads, but this would give excess of power under normal going and a consequent increase in gasoline consumption. The value of the innovation lying in low working cost. A contemplated improvement is the use of a low-g geared winding drum operated by the engine, to be used solely for starting the barge.

COL. SOHIER MASSACHUSETTS HIGHWAY COMMISSIONER

BOSTON, June 22.—An important change has been made in the Massachusetts Highway Commission, the State body which has in charge the administration of the automobile laws. By the appointment of William E. McClintock, who has long been chairman of the Highway Board, to the position of chairman of the commission which is to govern the burned city of Chelsea, a vacancy was created. The acting Governor named Harold Parker, a member of the board, to become chairman and appointed William D. Sohier, of Beverly, to the vacancy. Colonel Sohier is an automobilist who takes a great interest in motoring affairs. He is president of the Safe Roads Automobile Association, an organization that has done much to compel respect for the motor vehicle laws of this State. It is not an anti-automobile

association, but is composed of owners of cars who believe in the reasonable use of the roads and the suppression of reckless driving. The new automobile bill which the present legislature is expected to pass was drafted largely by Colonel Sohier. He is also a good roads enthusiast and, as chairman of a committee of North Shore summer residents, has had charge of the expenditure of large sums of money privately subscribed for road work. It was he who introduced the use of calcium chloride as a dust layer in this part of the country, and who has taken a leading part in experiments with oil and other road preservatives. The automobilists are well satisfied with the appointment of Colonel Sohier to the board, for they believe that their interests will be advanced by his official actions.

TO the inexperienced observer, the Packard "Thirty" for 1909 is just Packard, and probably to those who are familiar with its distinguishing characteristics, this suffices to describe it better than anything else possibly could. As the result of the consistent adherence of its builders, the Packard Motor Car Company, Detroit, Mich., to the policy of devoting the entire energies of its engineering staff and huge plant to the development of a single type of car, it has been possible to say this of the Packard car for the past four or five years, for, although a comparison of the latest Packard representative to uphold the name, with its predecessor of four or five years ago, would reveal startling differences, the process of evolution has been so gradual as scarcely to be perceptible to any but the observant eye that sees far more than a casual glance reveals.

Nor has this process ceased, as even the 1909 model of the "Thirty" has distinguishing features of its own. Doubtless the first of these to be brought to light is the disappearance of the short independent lever to operate the reverse of the gear-set, and at first glance it appears as if the principle that the Packard builders have adhered to without change, despite the almost universal trend of both foreign and American practice, had finally been abandoned. That is, the use of a progressive three-speed sliding gear-set, instead of the selective type now so generally employed. The new gear-shifting lever on the latest

model shows that it is intended to be worked selectively, although there is no "H" sector, or gate, as is commonly employed on the majority of cars using this type, and at a casual glance one would be apt to say that the Packard designers had finally been won over. Investigation shows this not to be the case, however, as the three-speed sliding gear of the progressive type has been retained intact, and moreover, its method of operation is still the same, the shifting lever merely being worked selectively in order to employ the reverse, thus doing away with the small third lever which has been a Packard feature for so long.

There are likewise some minor changes about the motor, but they are such as only to be revealed by an actual comparison of the details of the 1908 motor and its successor. For instance, the idler gears between the crankshaft and the two to one pinions on the camshafts have been eliminated by making the driving pinions that much larger, this change conducing to a much simpler arrangement and making the motor even more silent running than previously. It will be noticed further that the crankshaft no longer protrudes through the crankcase forward, but the shaft of the starting crank has been designed to enter the crankcase to engage with the main shaft, thus permitting the use of an entirely oil-proof joint. Roller bearings have been substituted for ball bearings in the front wheels and the steering arm has been shifted to run over the axle instead of under it as

Showing the Packard Carburetor and Hydraulic Governor.

Packard Magneto, Oil Tank and Oil Pump for Lubrication.

Rear Axle Driving Unit of the 1909 Packard "Thirty."

previously. Experience has shown that the polished surface of the rear face of the front seats is the first to suffer from scratches, and it has accordingly been upholstered the same as the remainder of the interior of the tonneau, instead of being painted, as is usually the custom, another slight change in the body equipment consisting of the use of a paneled door. The forward mudguards have also undergone a slight alteration, as will be apparent from the photograph showing a forward view of the chassis, an integral flare or dropped piece having been added to prevent dirt being thrown out.

Little Change in the Power Plant.

Apart from those detailed refinements of the motor which have already been made mention of, it is difficult to find any changes of particular note in the design or construction of the power plant of the new Packard. The same familiar motor with its twin castings and valves in outboard ports on opposites of the cylinder head, worked by the direct thrust method, and which has done so much to earn for the Packard its reputation as one of the smoothest and quietest running of American cars, is retained practically intact. The cylinder dimensions are 5-inch bore by 5 1-2-inch stroke, and although nominally rated as being 30 horsepower, this motor will actually develop practically double that, so that even the Packard stock touring car with full equipment is capable of a mile a minute or better on a good road. The castings for the cylinders, exhaust manifolds, pistons and piston ring blanks are all imported from France, being made of a special grade of gray iron for this purpose. These are

Neatness and Accessibility of Packard Dash and Control.

brought over in the rough and machined at the Detroit plant, the pistons being accurately ground and fitted with four ground rings, while the cylinders, pistons and rings are lapped together with a polishing agent in order to obtain a perfect fit.

Parsons white bronze is employed for the three liberal-sized bearings of the crankshaft, the journals of which are ground to size, and which is noted for its extreme accuracy due to special manufacturing and inspection methods. The connecting rods are one-piece drop-forgings, the piston pins being bushed with Packard special bronze. The valves are oppositely disposed and are made interchangeable, operation being by the usual direct thrust method from camshafts inclosed with the crankcase, where they are fully protected from dirt and are certain of lubrication. One of the distinguishing features of the Packard motor where its accessories are concerned is to be found in the fact that the magneto and water pump gears as well as the timing gears are contained in a separate, but integrally cast, oil-tight extension of the crankcase.

Some of the Motor's Interesting Details.

The crankcase is cast of a special aluminum alloy in three horizontal sections, the uppermost serving as the engine base,

"Head-on" View of the Latest Packard Representative.

to which the cylinders are directly bolted and which in turn is supported directly on the side members of the main frame of the chassis. On each side of the motor, between the supporting arms, is a horizontal, integrally cast web, entirely inclosing the space between the motor and the frame, thus affording complete protection to both the motor and all its accessories. The crankshaft bearings are held between the uppermost and the middle sections and extreme rigidity is obtained by the use of massive webs. The bottom section is merely an oil pan and is easily removable for the purpose of inspecting the connecting rod ends, main bearings or the camshafts without the necessity of disturbing any of the bearings. The crankcase is divided into front and rear compartments by partition supporting central bearing.

Features of the Motor's Accessories.

Coming to the motor accessories, the carbureter is of the special type evolved by the Packard designers and employed on this car for a number of years. It is of the usual float-feed, aspirating nozzle type with auxiliary air inlet, but has numerous distinctive features of its own. The cylindrical vertical mixing chamber has the nozzle situated in its lower portion, while there is a butterfly throttle above which is intended solely to control the quantity of fuel passing to the motor, but not its quality. The auxiliary air inlet consists of a poppet-valve controlled by:

The Packard "Tout Ensemble" Shows Very Little Change in the "Thirty" for 1909.

an adjustable helical spring, and is designed to automatically govern the amount of air admitted to maintain the mixture practically uniform at all motor speeds. The tension of the spring may be altered to suit different atmospheric conditions, by means of a small lever situated on the dash. A uniform temperature is maintained in the carburetor by means of a water-jacket through which the circulating water of the motor is run, this jacket surrounding the mixing chamber. To facilitate starting in cold weather, there is provided a primary air intake shut-off.

The cooling water is circulated by means of a positively-driven centrifugal pump, a special feature of which is its hydraulic pressure lubricated thrust bearing. The radiator is of the usual cellular type long a feature of the Packard and its capacity is five gallons. The draft through it is forced by means of a belt-driven fan supported on an adjustable ball-bearing mount attached to the front of the motor base.

Dual High-tension Ignition Employed.

An Eiseemann magneto of the high-tension-with-coil type is employed as the main standby of the ignition system, and is supplemented by a set of Fulmen accumulators working a synchronized high-tension system through a single coil. The Eiseemann magneto is mounted on the left side of the motor bed and is gear-driven by means of inclosed pinions. The transformer coil for the magneto current and the single vibrator coil for the battery side of the ignition system are both contained in the same case mounted on the dash, with a single hand lock switch between. The timer for the battery primary current is located on a vertical shaft at the rear of the motor and is driven from one of the camshafts through inclosed bevel gears. The distributor, high-tension wires and the spark plugs are common to both systems. Universally jointed knife switches are employed for testing purposes.

For lubrication nothing has proved superior to the splashing of oil in the crankcase, and it is depended upon to effect this essential operation in the Packard motor. An oil tank holding one gallon is situated between the two pairs of cylinders in a location where the oil is maintained at a uniform temperature regardless of the weather. From this tank oil is pumped independently to the front and rear compartments of the crankcase, in each of which the level is maintained separately. For distributing the oil, a plunger oil pump having an adjustable stroke is employed. It is accessibly located on the left hand of the motor, and is driven by a worm on the ex-

haust valve camshaft. The oil passes through two sight feeds on the dash in passing from the tank to the crankcase, and the drains in the latter are fitted with anti-clogging devices that are properly located.

The motor speed is regulated by an effective and easily controlled hydraulic governor incorporated in the water circulating system and acting directly on the butterfly throttle, the governor being cut out of action by the usual pedal accelerator, although the throttle is also under hand control by means of the hand lever.

The first step in the transmission of the power from the motor to the rear wheels consists of the internal expanding type of clutch which has been a distinguishing feature of this part of the Packard ever since 1904. It is extremely simple, merely comprising a ring expanding within the flywheel rim and actuated by an adjustable screw and nut device. A long propeller shaft connects the clutch with the gear-set and is equipped with effectively incased universal joints at each end. The change-speed gear, the bevel gear drive and the differential are all inclosed in a common housing located on the rear axle, forming a neat and compact rear-axle unit. As in the 1908 model, which marked a change in this respect, the casing is internally ribbed, thus presenting a smooth outer surface, while hand holes have been provided for inspection. The differential gear unit is supported by its own bearings so that the live axles may be withdrawn without disturbing the gears. Three forward speeds are provided with the direct drive on the third. Gear shifting is easily accomplished on the progressive system, the actuating slide rod being annularly grooved to correspond with spring controlled spacing dogs, which determine the correct positions of gear engagement. By giving the shifting level a lateral movement, the reverse may be obtained.

Two independent sets of brakes housed in special drums on the rear wheels are employed, the external contracting set constituting the running brake for general use, while the internal expanding brakes are operated by the hand lever and constitute the emergency brake. A drum disc entirely incloses and protects each internal brake.

The steering gear is of the worm and sector type, the latter essentials being forged integral with their respective shafts, and a large, rigid steering column is employed. Any of the standard types of bodies such as the touring, roadster, limousine, as well as the new close-coupled type, are mounted on this chassis. In the case of the touring car, the list price of \$4,200 is now made to cover five lamps, a gas tank and the two extra tonneau seats.

Close-coupled Body Originated by the Packard Body Department for the "Thirty" Chassis.

THIS is a comparatively new comer, designed particularly to meet the demand of the large body of autoists who desire an up-to-date car with plenty of power at a medium price, and as the choice of its title indicates, it hails from what is fast becoming the automobile manufacturing center of the country—the Middle West. It is the product of the Midland Motor Company, Moline, Ill. There has been no attempt whatever to produce something radical or revolutionary in the shape of a car, as well recognized standards have been followed throughout where both the design and construction are concerned. The motor is rated at 30-35 horsepower and consists of two twin-cylinder castings with the valves all placed on the left-hand side. The cylinder dimensions are 4 1-2-inch bore by 5 1-2-inch stroke, and the motor has been designed to produce its rated output at a moderate, normal speed, although it is capable of exceeding the latter by a considerable percentage. Both the inlet and exhaust manifolds are held on by the same yokes and may be taken down simply by loosening a few bolts. One of the features of the motor is to be found in the extra shaft running along the valve side of the motor and which serves to drive the gear pump for the circulation of the cooling water. The ignition timer is set on a vertical standard close to the pump at the flywheel end of the motor.

Ignition is of the high-tension type, employing storage batteries and dash coil, while the lubrication is taken care of by a force-feed oiler delivering oil directly to the bearings and splash from the crankcase for the pistons and piston pins. The radiator is of the vertical, flat, tubular type and is placed entirely behind the

front axle, which serves to add greatly to the appearance of the car, besides bringing the load between the axles. For the transmission of the power a floating disc clutch equipped with large cork inserts is employed. It runs on roller bearings and is provided with a ball thrust bearing. There is a coil spring torsion shock absorber placed between the clutch and the change-speed gear-set and the former is also provided with a clutch brake to prevent spinning and which makes easy and noiseless gear-changing possible. The gear-set is of the sliding type, operating on the selective plan and provides three forward speeds and reverse. The gears are of nickel-steel of 1 1-16-inch face by six pitch and their shafts run on Timken roller bearings. From the gear-set there is a straight-line drive by shaft to the bevel gears in the rear axle driving unit, which is also equipped with Timken roller bearings throughout. A semi-floating type of rear axle is employed, while the front axle is a one-piece I-beam drop-forging, the wheels front and rear being equipped with roller bearings. The suspension consists of semi-elliptical springs forward and scroll-head full elliptics in the rear, while the brakes are of the external contracting and internal expanding type, located in separate drums on the rear wheels. The tire equipment is 34 by 4-inch on all four wheels, Marsh rims being fitted as part of the standard equipment. The frame is of the usual standard pressed steel construction, amply reinforced at the corners and braced by transverse pieces, the motor and transmission being supported on a sub-frame, as will be evident from the plan view of the chassis reproduced here.

Details of the Midland Under the Footboards.

Quartering View Forward, Showing Midland's Neat Lines.

Highest Type of Oiled Highway in Southern California.

IN the previous article I described an incident which had just come to my personal attention. It related to an automobile, hopelessly mired on the great highway connecting two among the principal cities of Southern California: Los Angeles and Pasadena. I do not think any more disgraceful spectacle has ever been witnessed in any civilized country.

But I am pleased to say that the redemption of Southern California seems to me to be close at hand. Already the finest road for automobiles which I have ever seen—and I am inclined to think the finest which exists in the United States—has taken the place of that slough of despond.

In no other part of the United States is there such insistent need for a system of improved highways as in Southern California. In no other part of the United States is there such a high average standard of intelligence among all classes of people. The people of Southern California may not see things as quickly; they are not as alert as they are in other sections. But when they do see, they act, and they act with a unanimity and effectiveness unequalled anywhere else in the country.

The only exception which I can think of to the statement I have just made is the intelligence displayed by the people of the State of New York in voting \$50,000,000 in bonds for highway improvements in that State. This is far less for New York than will be the amount of money which will be realized in bonds in Southern California for road building within the next year, unless present signs fail. New York was educated up to this through a period of enlightenment which California never had, and without the autoists New York would not have gotten its bonds.

This is not meant for invidious comparison, because I think that the action of New York was grand, and was of unspeakable value to the rest of the country; and it is quite probable that the example of New York was the most inspiring influence which actuated the people of California. Be all that as it may, the marvelous fact is as follows:

About the time that automobile of which I have spoken stuck in the mud on the Pasadena boulevard, the people of Southern California awakened to their need for improved highways. It

The first of the series of three articles by Mr. Abbott on "Recent Progress in Highway Improvement in Pacific Coast States," was published in "The Automobile," June 18.

seemed to be a vision which hurst upon them almost as suddenly as that which hit Saul of Tarsus when he journeyed from Jerusalem to Damascus.

The Chamber of Commerce of this city called upon the counties of Southern California to send a representative delegation to meet in convention here and formulate a plan for relief. As the result of this convention a committee was sent to Sacramento to secure suitable legislation under which the work could be attempted. Considering the little time for digesting the subject, it is amazing to think how good a statute this committee succeeded in getting enacted.

It is impossible to quote this statute at length in this article. The gist of it is that it provides for the appointing in each county, by the board of supervisors of the county, of a highway commission for such county. As a condition precedent to the appointing of this commission, the board of supervisors must receive a petition

signed by the "freeholders electors of the county equal in number to at least 10 per cent. of the vote cast for governor in said county at the last election, praying that the matter of issuing bonds of the county for highway purposes be submitted to the electors of the county."

It is prescribed as the duties of this highway commission, so appointed by the supervisors, to prepare a map, outlining a system of public highways for the entire county. This highway commission is authorized, "with the consent of the board of supervisors, to employ, at the cost of the county, a competent engineer or engineers and other experts to make any necessary surveys, and prepare said map, and to assist the commission in determining the best material to be used and the best manner of making such improvements and the cost thereof." No restriction is placed upon the compensation which shall be allowed to the engineers or experts, thus leaving it open to the highway commission to secure the best advice obtainable.

When the map and estimates are ready, they must be approved by the county surveyor and supervisors, and when approved, the county supervisors "shall, without delay, call an election to determine whether the bonds of the county shall be issued in the amount recommended by the commission for the purposes stated in their report." Should the bonds be voted, then this highway commission continues to exist as a body until all of that money

Outspeeding the Electric Car on Pasadena Boulevard.

Fifty Miles an Hour in Southern California, Over Perfectly Constructed Roadway, Making Automobile Travel Ideal.

has been expended, when that commission shall become defunct. If the needs of the county at some future time require, another commission can be instituted in the same way.

Under that statute, for the enactment of which the agitation began but little over a year ago, the highway commission appointed, in pursuance of it, in Los Angeles county, has almost completed the prodigious task of designing a comprehensive system of highways for Los Angeles. The present plan is to recommend the issuance of \$3,000,000 in bonds to build 300 miles of road, of which, as provided by this statute, all shall be constructed "of a durable and lasting character."

The statute further provides that the macadamized or paved portion of the roadbed constructed on any highway or portion thereof, improved under this act, shall not exceed 16 feet in width, unless donations are made to the highway commission for that purpose, in which case such donations may be used to defray the increased cost of constructing such macadamized or paved roadbed more than 16 feet wide, on any part of said highway specified by the donors. I believe that such a record of diligence in any highway undertaking has never had a parallel.

It is the expectation of the Los Angeles County Highway Commission to be able, before this article can appear in print, to submit their final report to the board of supervisors, and ask that the bond election be called immediately. It is believed that the election will carry, and that this \$3,000,000 will produce a system of highways more nearly approaching the facilities of

that character in the Garden of Eden than any other ever attempted by human agency.

Other counties of this State are working as conscientiously as Los Angeles county, and within one year from now it is confidently expected by the advocates of good roads in California that every county down the coast from Marin to San Diego will be at work upon its respective highway system.

One of the conspicuous features of this plan will be for each county to have a piece of road which shall be a portion of that great highway to be built down this coast.

Already there is a very strong sentiment growing in the State of Washington for the greater highway to run from Blaine to Tia Juana which shall be the Riviera of the Western world, connecting the British possessions on the north with Mexico on the south. When finished, it will be the most famous road on earth, and will tend to open up this Pacific coast empire as no other single agency could.

Under the leadership of Judge Webster, Oregon will get lined up on a plan to utilize its convict labor for road building, and will arrange that these convicts shall work on the north and south road through that State, which shall be a portion of the through highway. Just how Northern California will look at this matter, and just how results there will be effected no one now can predict. But those who know the spirit of the Argonauts will not doubt that California will be equal to the emergency, and will not fail to justify her traditions.

CALIFORNIA AWAKE TO IMPORTANCE OF ROAD IMPROVEMENT

SAN FRANCISCO, June 18.—The people of California have awakened to the realization of the value of good roads, and an active movement is on foot, backed by influence, money and the power of the State, which is sure to culminate in nothing less than highways worthy of the State. At a meeting of the Counties Committee of the California Promotion Committee, held in Santa Cruz on June 6, representative men of San Francisco, Sacramento and other large towns met in conclave with the Counties Committee, and a strenuous campaign has been mapped out, but as yet has not been definitely decided upon. Andrea Sparboro, chairman of the Counties Committee, opened the convention with a most interesting speech. Among other things, he said: "Our subject, to-day, might really be more properly entitled bad roads, because, unfortunately, so far we have more bad than good roads in our State, but we must consider that this is a new State, with a sparse population, being composed of an energetic and progressive people. It is now time that we take hold of this matter in earnest and see to it that our State is traversed in all directions by good roads. It only requires that we consider this from a practical business point of view. Every year we spend for repairing wagons and the purchasing of horses, and lately repairing automobiles, more than it would cost to keep our roads in the very best condition.

G. L. Morton, representing the United States Road Making Bureau, stated that the trouble of most of our roads is that they are built politically instead of scientifically.

L. P. Lowe, president of the Automobile Association of California, talked on the necessity of good roads from the automobilists' standpoint, suggesting: "Tax all vehicles and then have the money used for a road fund. I am sure that will bring the desired result, and no automobilist or wagon owner anywhere can object to such a tax, if he knew the money was going back into good roads for his use. Or let every interested man vote for good roads, if we can make it a political issue. There are 50,000 automobilists in California, and if all would vote for such a plank they alone could carry the measure." Charles C. Moore, president of the San Francisco Chamber of Commerce, and a more enthusiastic autoist, suggested that the State build object-lesson roads, showing to every county and district what a good road is like. Governor Gillett, who was delayed by a train wreck about fifty miles from Santa Cruz, and had to complete his trip in an automobile, spoke most urgently for the cause of good roads. It was he who suggested that bonds to the amount of \$18,000,000 be issued, which amount would be ample for the construction of about 3,000 miles of the finest macadam road that could be built, and the expense would hardly be felt.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
- Dec. 31-Jan. 7.....—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.
- Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
- February, 1909.—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Races, Hill-Climbs, Etc.

- June 24-27.....—New York and Philadelphia, Double-Head Endurance Run to Delaware Water Gap, under the auspices of the "Public Ledger" of Philadelphia.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- June 27.....—Norristown, Pa., Skippack Hill Climb, Norristown Automobile Club.
- June 27.....—St. Louis, Second Annual Owners' Reliability Run, Automobile Club of St. Louis.
- June 30.....—Rockville, Conn., Hill Climb, Automobile Club of Rockville.
- July 4.....—Long Branch, N. J., Race Meet, Elkwood Park Automobile Association.
- July 4.....—Lowell, Mass., 250-mile Road Race, Lowell Automobile Club.
- July 4.....—Wildwood-by-the-Sea, N. J., Annual Speed Tournament, Motor Club of Wildwood.
- July 4.....—Indianapolis, Ind., Road Trials, Indianapolis Automobile Club.
- July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
- July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
- July 11-15.....—Milwaukee, Wis., Wisconsin Trophy Run, Milwaukee Automobile Club.
- July 15.....—St. Paul, Minn., Race Meet, Automobile Club of St. Paul, H. S. Johnson, Secretary.
- Aug. 14.....—Chicago, Third Annual Algonquin Hill Climb, Chicago Motor Club.
- Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.
- Oct. 24.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.
- Nov. 26.....—Savannah, Ga., Grand Prix Race, Savannah Automobile Club.

FOREIGN.

Shows.

- Oct. 11-18.....—Paris, International Congress and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.

BOOKS OF AUTO INTEREST.

Dunham's Auto Record and Expense Book.—As its name indicates, this is intended to aid the autoist in keeping track of his trips, mileage, expenses and the like. The flyleaf is prepared for a brief digest of the biography of the car, such as name of its owner, name of the car, its factory number, license number, date of acquirement and the like. This is followed by an index page and then 42 pages are devoted to trip records. These are followed by pages tabulated for trip costs, a page for weekly mileages throughout the year, two pages for "miscellaneous troubles" and a like number for "tire troubles"; then follow spaced tables for expenses of various kinds, such as storage, batteries, carbide, oil, "ignition," gasoline, repairs and parts, sundries, cases and inner tubes, chauffeur, and a table to record the mileage obtained from each tire. Following there is a recapitulation showing the expense by months for the whole year. Its full title is "Dunham's Systematic Automobile Record and Expense Book," and it is published by the Dunham Press, Bridgeport, Conn.

Guide Michelin, France.—This is the ninth annual edition of what is looked upon as the handiest and most authoritative work on the roads of France. By the use of a large number of symbols, the character of a place, its hotel and garage accommodations and all other information necessary to the tourist is condensed into a remarkably small amount of space, and thus saves a great deal of trouble in making use of the Guide for reference. Each *Département* is represented by colored maps, and the latter are also given for the different towns and cities throughout the country. Customs information, the formalities to be gone through in registering and obtaining licenses, the speed laws and other information of a similar nature, all of which is very necessary to the foreigner, is given with much detail. Although the work is of convenient size for the pocket, it contains more than 600 pages, including 24 pages of colored maps of cities and some 60 maps of provinces or departments, beside a map of France entire, showing the divisions. There is also considerable information of a more or less technical nature included.

"Motoring Abroad."—Frank Presbrey, senior member of the Frank Presbrey Company, of New York City, is the latest to present the story of a trip in Europe by automobile, and his work, as named above, has just been issued from the press of the Outing Publishing Company. Credit is due to the author for getting away from the stereotyped method of rewriting Baedeker and school histories that has been indulged in to such an extent by his predecessors in the field, and as he neither believed in speeding nor following the beaten track, he succeeded in "seeing the country," and his book marks a departure from the usual method of telling how it was done. The pictures of the French roads, the numerous historical spots visited and the pleasant scenes are also better than many that have preceded them on a similar mission. This book is a volume of 294 pages, and is a beautiful typographical work.

Die Kugellagerungen; ihre Konstruktion unter ihre Anwendung für den Motorwagen-und Maschinenbau (Ball-bearings: their construction and application to the automobile and machine shop) is the title of a recent work by August Bauschlicher, just published by M. Krayn, Berlin. It is a book of 230 pages, well printed on good paper, but in paper binding, as is customary with German technical publications made to sell at a low price. It is being published at Marks 7.50, or about \$1.90, in paper, and about \$2.20 in regular binding. There are no less than 267 illustrations, supplemented by a great many tables and other data pertaining to the subject.

A Treatise on Motor Vehicle Law.—This is an excerpt from a work entitled "The Law of Motor Vehicles," which is a contribution to the Cyclopaedia of Law and Procedure, published by the American Law Book Company and written by Alfred W. Varian, of New York City. It is intended only for the practicing lawyer and is not a work for popular consumption.

AN INDEPENDENT AUTO ENGINEERING BODY.

Although it naturally embodies much that lies within the scope of the mechanical engineer, as well as coming within the province of those who have been trained to steam and electricity, automobile engineering is in itself a decidedly distinctive branch of the art and as such it has shown that it stands apart. Early in the history of the development of the automobile, the need for mutual intercourse, support and aid that only an engineering organization can properly minister to, was keenly felt by those who were struggling to improve the power-driven vehicle, and it goes without saying that progress would have been even more rapid than has been the case, had there been any opportunity for cooperation. Manufacturers' associations were quick to feel this need and the result was the establishment of trade engineering organizations that have accomplished much—for their own benefit.

The real need, however, has been for an independent body, free from trade affiliations, and in the deliberations and investigations of which all automobile engineers could share. This has been met by the organization of the Society of Automobile Engineers, which holds its Third Annual Summer Meeting in Detroit this week. In selecting the latter city as the place of meeting, recognition has been paid to the fact that it has no rival for the honor of being the center of the American automobile industry, and the gathering, while merely one of

the regular occasions on which the automobile engineers meet, is of importance as illustrating the growth of the movement in support of an organization the chief object of which is to foster independent engineering investigation in the automobile field. It also provides an excellent opportunity for the technical fraternity of the industry to meet and become acquainted. At the outset, the idea was to form a body of designers who could benefit one another by mutual intercourse in the solution of the numerous problems that confronted them, but the movement has grown beyond that. There is a large body of trained men devoting their talents to the production of parts and accessories and in order to be thoroughly representative of the industry as a whole, they have been included so that the Society now includes in its membership, talent from every branch of automobile manufacture.

As a matter of fact, the accessory maker has frequently had a stronger influence on automobile design than has the man behind the draughtsman, and who has nominally posed as the creator of the car. This has been the case particularly where the large companies producing parts, such as motors, gear-sets, steering gears, rear-axle driving units and other components of equal importance are concerned, so that the engineers of such companies really fill the rôle of designer more fittingly than do those who select the parts and have them assembled.

IMPORTANT ADVANCE IN AUTO REPAIRING.

Belonging in the category of things used mainly for pleasure, the automobile is something to which the ordinary ethics of business do not seem to apply—at least where the prices of repairs and replacement parts are concerned, and particularly the latter. But those dealers and makers who have set the figures for new parts so high that it would cost three times the list price of the car to build one from them, will find a serious setback to their activity in this direction in the recently developed process of autogenous welding. The details of the latter are fully described in this issue in the shape of a paper on the subject read before the Society of Automobile Engineers at its meeting at Detroit this week. A little consideration will reveal the endless possibilities that the process holds for automobile work.

The purchaser of a car with a one-piece four-cylinder casting need no longer dread the possibility of having to pay for an entire new set of cylinders, owing to some slight defect or accident, as repairs will often be possible without disturbing the engine. Nor need a hole or crack in an aluminum crankcase or gear-set housing any longer occasion its going to the scrap pile, as it may be made good in less time than is required to describe the operation. Broken crankshafts, whose only value hitherto has been to serve as models by which to produce their duplicates, may be made sound again at a fraction of the cost, and so it is with many other parts, the breaking of which has hitherto meant an expensive replacement. The possibilities of the new process are equally great where original construction is concerned, and manufacturing costs may be greatly reduced by the elimination of a very great percentage of the "wasters" that form such an important item, while great changes in construction methods which should do much to lower the cost of automobile building are also to be looked for from the new process in the near future.

A. A. A. ENTRIES TARDY, BUT NOT BEHIND LAST YEAR

UP to last Monday twenty-three entries had been received for the A. A. A. reliability contest. They were made up of fourteen touring cars for the Glidden contest, seven runabouts for the Hower trophy and two official cars.

"The entries are as late in coming in as usual," said Chairman Hower, of the A. A. A. Touring Board, who was in New York on Monday. "Still we are only four entries behind the corresponding date last year, despite the fact that the fee has been doubled. Last year the morning before the closing of entries brought me forty nominations. The makers can and will not be hurried in this matter. I have every reason to expect the biggest and most glorious tour yet promoted by the A. A. A."

Mr. Hower says that while the tour is designed to be a severe test of the cars, it is not intended to be a killing task for the drivers, and that the fear of some that they will be required to drive as hard through excessive heat as ordinarily is unfounded, as due account will be taken of the weather and all allowances made for it in the schedule for each day. It was for just such contingencies that the power of altering the schedule was given to the chairman.

In order to facilitate the work of the thirty or forty representatives of the leading newspapers who accompany the tour, Chair-

man Hower has this year sent them the itinerary and requested the telegraph companies to make better arrangements than were to be had last year for handling the large volume of press copy filed at each overnight stopping place. He has received reply that this will be done. The official list of entries is as follows:

For Glidden Trophy.—No. 1, Charles Clifton, Great Arrow; No. 2, Charles Clifton, Great Arrow; No. 3, J. W. Maguire, Great Arrow; No. 4, R. M. Owen, Reo; No. 5, E. H. Parkhurst, Peerless; No. 6, E. H. Parkhurst, Peerless; No. 7, E. H. Parkhurst, Peerless; No. 8, R. M. Owen, Premier; No. 9, R. M. Owen, Premier; No. 11, Gus G. Buse, Thomas; No. 12, H. H. Franklin, Franklin; No. 13, John Wilkinson, Franklin; No. 14, G. H. Stillwell, Franklin.

For Hower Trophy.—No. 100, R. D. Garden, Great Arrow; No. 101, R. M. Owen, Reo; No. 102, W. H. Van Dervoort, Moline; No. 103, Charles Clifton, Great Arrow; No. 104, Henry Johnson, Premier; No. 105, John Breyfogle, Gearless; No. 106, F. A. Barton, Franklin.

For Certificate.—No. 10, Paul Gaeth, Gaeth.

Non-contestants.—No. 98, R. M. Owen, Premier, pilot car; No. 99, Charles Clifton, Great Arrow, chairman's car.

The latest entry to be named, and not included in the list, is that of Mrs. Joan Cuneo, or, more strictly, of her husband, Andrew Cuneo, whose 45-50-horsepower car will be driven by Mrs. Cuneo on the tour. This will be Mrs. Cuneo's third Glidden tour. Entries for the tour close July 3, with F. B. Hower, 760 Main street, Buffalo, N. Y.

BOSTONIANS WILL WELCOME A. A. A. TOURISTS.

Boston, June 22.—Automobilists of this city are much pleased by the decision of Chairman Hower, of the A. A. A. Touring Board, to change the itinerary of the annual tour so that an over-Sunday stop will be made in this city. When the route and the day's run were announced the local enthusiasts were greatly disappointed because it was planned to have the tour pause here only over the night of July 17. It was felt that Boston, being the home of the donor of the principal trophy, and this city having always supported the tour, the over-Sunday stop should have been made here instead of at Poland Springs, in Maine. The protest of the local autoists was forwarded to Chairman Hower by Secretary James Fortescue, of the Bay State Automobile Association, and this morning came a reply stating that the plans had been changed so that the tour would stop here over Sunday, July 19, and then would continue on to Maine and New Hampshire. While the tourists are in Boston they will be entertained by the Bay State Association, and plans for the day are already under consideration. By that time the Bay Staters will be quartered in their new apartments in the Hotel Carlton, and will be in a better position to entertain a large party than ever before.

A MODEL STATE TOUR TO BUFFALO THIS.

For touring to the big National Good Roads Convention at Buffalo, July 6, 7 and 8, the Pennsylvania Motor Federation has a plan that seems likely to commend itself to the organizations of other States in which tours are being formed. Chairman Godcharles, of the Pennsylvania Motor Federation touring board, is organizing its excursion in a way to include the whole State. There will be three sections to the tour, one starting from Pittsburg, to cover the western part of the State, one from the principal cities in the eastern part and the third section from the central part of the State.

This convention has been taken hold of in a way that has surprised its promoters, and its proportions are growing daily. Accommodations at Buffalo will be at a premium during the three days of the convention, and those going to it should secure their bookings ahead of time.

Those interested in the runs and other entertainments, apart from the practical work and the speechmaking, will find A. H. Knoll, chairman of the entertainment committee, at the Hotel Iroquois from now on. The hostelry mentioned will be the general headquarters of the American Automobile Association and all the committees of the convention.

CLIFTON'S PIERCE NOW MAKING PRELIMINARY TOUR

"**SCHEDULE MAKER,**" a six-cylinder Pierce Great Arrow No. 1, for the Sixth Annual Tour of the American Automobile Association, and driven by Teddy Day, veteran of every great tour promoted by the A. A. A., left Buffalo June 18 for a trip over the route of the "mountain tour." This journey by Mr. Day will be made in company with John Williams, who will drive a runabout in the tour for Robert D. Garden, of the Harrolds Motor Car Company, of New York; Mr. Law, of the sales department of the George N. Pierce Company, and F. Ed. Spooner, the correspondent and photographer. The start was made at daylight, and each day's journey of the tour will be made in turn through Pennsylvania over the Alleghany, Blue Ridge and Pocono Mountains, up the Hudson, over the Adirondack and Catskill mountains, and through New England over the Berk-

shire mountains to Poland Springs, Me., and then returning over the White and Green Mountain ranges to Saratoga, where the tour will end, and then to Buffalo, to start out upon the tour itself within a few days. The car Mr. Day is driving will be No. 1, entry of Col. Charles Clifton, of the George N. Pierce Co.

All pathfinding tours made over the route of the annual event in the touring world are made at a time when the snows have just left the ground, and when the roads are at their worst. Frequent stops to inquire the way are made, and many stops for pictures bring delay. It is consequently practically impossible to determine the actual driving time, nor is it possible, except roughly, to determine the probable time which could be made. The objects of the present supplementary tour over the route are to determine the present condition of the roads, and also to determine the actual time which may be made in each day's run.

EXPOSITION BUILDING FOR A. M. C. M. A. CHICAGO SHOW

ALFRED REEVES, general manager of the A. M. C. M. A., who has returned from a ten days' trip through the West, reports that plans for the association's proposed show in Chicago are practically settled.

The present plans call for the affair to be held in the Exposition building, at Forty-third and Halsted streets, which offers 148,000 square feet of floor space, or more than twice as much as can be obtained in any other building, either in Chicago or in New York. The show committee of the association will go to Chicago early in July to take up the final arrangements.

Almost without exception, the automobile factories of the West are working full time, turning out cars for this year and preparing for 1909. It is the universal opinion that 1909 should be a record year in motor car manufacture and sales.

"At Chicago," said Mr. Reeves, "the Holsman people continue to have a demand far in excess of the supply for their high-wheeled carriages, which, although primarily for use in the country, are being used in many of the big cities. The company has filled a certain field untouched by any other maker. The Holsman car has always captured clean scores in all reliability runs.

"At Kenosha, the Thomas B. Jeffery Company are working full time, turning out Rambler machines. With Mr. Jeffery I made a round of the factory, and the plant is certainly an extraordinary one, including, as it does, a half-mile track for testing cars.

"At Racine, the Pierce-Racine people announce that they will continue their successful model of the present year. The Mitchell Motor Car Company are in an enviable position with their four-cylinder runabout, which, in the opinion of many, is extraordinary value for \$1,000. The plant is working right up to its limit turning out cars, and Messrs. Gilson and Bates told me plans were under way for increased facilities for 1909.

"W. H. Van Dervoort, president of the Moline Automobile Company, at East Moline, Ill., showed me through one of the best equipped factories in the West, and outlined their plans for

1909, which will include some sensational cars at sensational prices. They have entered a Moline for the Hower trophy in the Glidden tour, and the car selected is now being put through a course of hard trials. It will be piloted by Neil Van Dervoort. The Moline Automobile Club is being formed by automobilists in that city, and W. H. Van Dervoort is slated for the presidency.

"At the Midland factory, Mr. Walton showed me the progress that had been made in getting out this year's product, and indicated some promising plans for 1909. One of the surprises on my trip was the well-equipped factory of the Kisselkar Company at Hartford, Wis. They will have two cars in the Glidden tour. I was shown the motor of the new six-cylinder, 60-horsepower Kisselkar that will sell at \$3,000. Their four-cylinder car, which is handled in Chicago by Webb Jay, has performed well in all contests, and has had an excellent sale.

"I attended the first day of the Republican convention at Chicago, and it is surprising how many men in automobile manufacture are interested in politics. Many of them were there as delegates. Among others I met were R. E. Olds, Benjamin Briscoe, J. D. Maxwell, Job E. Hedges and Capt. Walter E. Edge of the Atlantic City Automobile Club."

ALFRED REEVES UNDERGOES OPERATION.

Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, was successfully operated upon for appendicitis at St. John's Hospital, at Yonkers, N. Y., on Monday, and is now practically out of danger, though he will probably be confined to the hospital for a fortnight yet. During his recent Western trip, Mr. Reeves complained of pains in the region of the appendix, and on his return home last week consulted his family physician, who advised an operation. He accepted the suggestion, and went to the hospital on Sunday. Mr. Reeves had contemplated another Western trip, which would take him as far West as the Pacific coast, but this journey will now have to be postponed for some time.

SOMETHING BEHIND BRIARCLIFF COMMITTEE MEETING?

THERE was a meeting of the contestants in the Briarcliff race at the Automobile Club of America last Thursday evening to discuss and organize for next year's contest. It seems the conditions of the trophy provide that those contestants in the 1908 race who shall consent in writing to serve, shall constitute the "Executive and Rules Committee."

The official report of the meeting says that 14 contestants were present without giving any names. Those known to have been in actual attendance, however, embrace C. F. Wyckoff, of Wyckoff, Church & Partridge, agents for the Stearns; S. B. Bowman, of the Bowman Automobile Company, agent for the Clement-Bayard and Apperson; H. A. Lozier, of the Lozier Motor Company; Walter C. Allen, of the Allen-Kingston and De Dietrich agency; Paul La Croix, of the Renault agency; Mr. Koch, of the Isotta Import Company, and Percy Owen, of the Bianchi agency.

Robert Lee Morrell, chairman of the 1908 committee, presided, and T. Francis Moore occupied the secretary's seat until their successors were appointed in the persons of C. F. Wyckoff, as chairman, and Sidney B. Bowman, as secretary, both announced to be but temporary appointments. Messrs. Morrell and Moore were then asked to withdraw as the gentlemen present desired to hold a closed session. It has been surmised, and it is very generally believed, that the discussion had to do with a project in contemplation by New York dealers in the direction of an inde-

pendent stand in the matter of any sanction or disqualification that may be granted or made by either the American Automobile Association or the Automobile Club of America. Color is lent to this assumption from the fact that following the meeting Tom Moore was told that his Elkwood Park meet had been approved.

The official report given out, however, gave no inkling of any such discussion or action. It stated in part:

"In view of the fact that the 1909 committee is empowered by majority vote to add to its number if it so desires, it was decided not to elect permanent 1909 officers at this time. It was pointed out that it would be advisable to effect a temporary organization for the present, so as to allow any members who may be later added to the committee, the privilege of a voice in the selection of permanent officers for 1909.

"Later meetings will be held to plan the many details, and to settle on the question of a suitable course for the 1909 race.

"By getting the preparations under way early, it is hoped that the large volume of work will be distributed, and that the duties of those who will have the actual handling of the details will be less arduous than is frequently the case where much of the real labor is crowded into a few weeks' time."

Incidentally it is reported that Robert Lee Morrell apologized to the committee for the use under a misapprehension of the wording of the Deed of Gift of the Briarcliff race in the regular list of the Automobile Club of America's proposed promotions.

The Sign That Greets the Driver in Middleboro, Mass.

HOW "SQUARE DEAL" WORKS IN BAY STATE.

MIDDLEBORO, MASS., June 8.—The question that has become a perplexing problem in many of the towns and cities of this State regarding the regulation of the automobile speeding through the towns has been practically solved by the local automobile club and it is daily receiving commendatory letters from all parts of the country.

For the past three years the selectmen have been troubled as to how they should proceed against the automobile speeders who were endangering life and property by their reckless driving through the town. Traps were resorted to and several arrests were made, but in some cases the innocent driver suffered, for he meant to drive carefully but was a little over the limit.

The stringent enforcement of the law meant a black eye to the business interests of the town, for drivers and owners would not stop here to purchase anything on their way to the beaches, and the merchants began to kick. It was then that the local automobile club came to the rescue and waited on the town selectmen. They asked that they have the privilege to make a try to regulate the speeding. It was rather a large question to ask to take the law out of the proper officials' hands, but, nevertheless, the request has been granted and the club immediately set to work.

Last year the club passed out cards stating that if the drivers would go slow through the town there would be no trouble in court proceedings. It proved successful, and this year the club has been given the same permission to regulate the speeding of machines through the thickly settled portion of the town. Banners have been stretched across all inroads to the town asking drivers not to exceed 12 miles per hour, and that the club will give them a square deal if they will give the club one. These signs are painted on canvas and stretched across the streets in such a manner that the drivers cannot help but see them. They are doing lots of good and there are very few cases of speeding now. There are, of course, a few "smart" drivers who ignore the signs, and speed at some places in the road, but members of the club know them, and if they continue they will be haled into court.

AMATEURS TO BE FEATURED AT ELKWOOD.

"The Long Branch Special," a ten-mile race for amateur drivers, under A. A. A. rules, is to be made a prominent feature of the Fourth of July meet, at Elkwood Park. This event is arousing much interest among the millionaire sportsmen who are promoting the meet. Among those who have already entered are Robert Guggenheim, Oscar Lewisohn and Alfred Seligman. Harry Levy has challenged all comers to go against his sprint record-holding Hotchkiss at from one to five miles, for a purse to be put up by the Messrs. Lewisohn. This race promises to eclipse all others in point of interest.

ALL READY FOR THE WATER GAP RUN.

PHILADELPHIA, June 22.—There will be a great outpouring of automobilists Poconowards next Wednesday morning, when the first day of the carnival of the Monroe County Automobile Association begins with a reliability run to Stroudsburg. The start from this city will be made from the White garage. A double schedule has been arranged—a 20-mile-an-hour limit for Classes A and B (touring cars and roadsters) and a 15-mile rate for Class C (small runabouts). MacDonald and Campbell have hung up a cup in the big class, similar trophies to be awarded to the winners in the other classes.

There was much uncertainty among the local entrants for the reliability run and the hill-climbs at the Delaware Water Gap and Canadensis as to the possibility of competing there and at Norristown on Saturday next, where many of them are also entered, but the Monroe county people settled that question by giving assurances that they would rearrange their program so as to insure its completion by midday Friday, thus giving everybody ample time to run down to Norristown for the big hill-climb at Skippack.

The list of entries for the latter event, by the way, has grown both in numbers and character of entrants until it has assumed the proportions of a national affair. Up to date no less than sixty-one entries, representing thirty-three separate manufacturers, have been received, and, as the road is in excellent shape, good weather is all that is needed to make the affair a success. With "Willie" Haupt's Chadwick, the Vanderbilt Pennsylvania, the big Stevens-Duryea, the Matheson, the Stearns, the Stanley steamer, and several other specially prepared cars out for the honors, the free-for-all, will be especially hard fought.

There will be nine events in all. Six gasoline classes—\$850 and under, \$851 to \$1,250, \$1,251 to \$2,000; 2,001 to \$3,000, \$3,001 to \$4,000, and \$4,001 and over—are programed. There will be besides a free-for-all for steamers, a free-for-all for gasolines, and a free-for-all electrics, the latter with eight entries.

Skippack Hill, as that portion of the Reading pike which shoots straight up from the valley of Skippack Creek is called, is 6,270 feet long, with a total rise of 352 feet and grade which at its steepest is close to 10 per cent.

BUFFALO CLAIMS ORPHANS' DAY RECORD.

BUFFALO, N. Y., June 18.—In its fourth annual celebration of Orphans' Day yesterday, the Automobile Club of Buffalo carried 1,577 children in 227 cars. It is believed that both in cars and children this is a record for the biggest club in the American Automobile Association.

[New York's Automobile Row Orphans' Day committee this year had 150 cars and trucks in line with the total number of children carried estimated at 1,500. Cars and trucks were packed to their utmost capacity, but no official count was made. A Packard truck, for instance, bore 70 orphans.—Ed.]

Buffalo's Orphans Coming Up Shady Delaware Avenue.

JUNETIME HAPPENINGS AMONG THE CLUBS

ALBANY CLUB START ON ANNUAL TOUR.

ALBANY, N. Y., June 20.—Carl Robinson, acting as official starter, had only six cars to send off, instead of thirty expected, when the annual endurance run of the Albany Automobile Club began this morning, at 6 o'clock. Those who stood by the annual event were: Matthew Van Alstyne, M. L. Ryder (two cars), J. B. Taylor, Fletcher Battershall, and Howard Martin. The run will last six days, and the route to be covered is from Albany to Greenfield, Mass.; to Providence, R. I., to New London, Conn., to Waterbury, Conn., to Albany. The car returning with the seal on the bonnet intact wins the prize, a silver cup offered by Archibald McClure. Wives and other feminine members of the families of the autoists accompanied them. It is to be a real endurance run, with speeding tabooed. While most of the members of the Albany club found it inconvenient to get away at the last moment, the club has a good record for the past, and this month it put over 100 automobiles in line and gave the orphans of all the asylums the time of their lives—an all-day tour about the city and suburbs, with refreshments served at a road-house several miles out.

THE CRACKS TO BE AT ST. PAUL'S MEET.

ST. PAUL, MINN., June 23.—Preparations for the great Shriner's meet on July 15 at the Hamline track are being pushed with vigor. H. S. Johnson, chairman of the racing board of the Automobile Club of St. Paul, reports gratifying progress in his negotiations toward securing the attendance of the crack cars and drivers of the country. He is confident that terms can be made with Barney Oldfield to insure his meeting Walter Christie. It is hoped and expected that Harry Levey will enter the Hotchkiss, which scored world's road records for the mile and two miles at the Jamaica, L. I., time trials, and that the entry of Maurice Bermin and his Renault will be secured. Fred J. Wagner, the official A. A. A. starter, who has great influence with all the racing cracks, is at work securing the signatures of the Eastern flyers.

A tri-city event is being organized, in which it is assured that C. A. Coey, of Chicago, will be a contender.

New track records are practically assured, since the Hamline course has been widened ten feet since Christie made his 52 seconds record mile on this circuit last autumn.

AKRON AUTO CLUB ELECTS NEW OFFICERS.

AKRON, O., June 22.—Officers were elected by the directors of the Akron Automobile Club on Friday evening last, as follows: President, Fred Work; vice-president, A. B. Smith; secretary, Andrew Auble; treasurer, E. H. Roth. The officers were given power to go ahead to push the construction of the Brecksville road, with a view of completing an improved highway from Akron to Cleveland. A consideration of the list of officers will convince anyone that the Akron Automobile Club will no longer be a dead proposition. Work, Smith and Auble are three of the most enthusiastic and energetic automobilists in Northern Ohio, who will leave nothing undone to boom things.

BREAK A SEAL AND YOU'RE OUT OF RUN.

WILMINGTON, DEL., June 15.—The Delaware Automobile Association is making arrangements for a sealed bonnet run on June 27, from Wilmington to Valley Forge, Pa., via Philadelphia, and return. If a seal be broken the contestant must drop out. Thus only those with perfect scores will finish. There will be classes according to the value of the machines and three silver cups will be offered as prizes. Entries will close with Charles G. Guyer, 826 Market street, on June 23. The entrance fee for members will be \$3; for non-members, \$5.

WOMEN'S MEMBERSHIP FOR THE L. I. A. C.

BROOKLYN, N. Y., June 24.—In order that women may enjoy the full privileges of the Long Island Automobile Club's country house, an amendment to the constitution is to be proposed, giving to them such membership as will entitle them to the use of the country house and the garage operated by the club and also to the right to display the club pennant on their cars.

Prizes won in the recent time trials at Hillside avenue will be presented at the clubhouse, 360-366 Cumberland street, Brooklyn, on the evening of Tuesday, June 30. The names of the various winners have been etched on the trophies, a longer and more expensive process than the usual engraving. Refreshments will be served and through the courtesy of J. Stuart Blackton, of the American Vitagraph Company, moving pictures of the time trials and the Long Island Motor Parkway inaugural will be shown for the first time. The presentation ceremonies will begin at 8:30 P.M.

The club has erected danger signs at the crossing of Betts and Thomson avenues, Woodside, L. I. At this point both thoroughfares are on a steep hill and one street is obscured from the other by a high hedge. This spot has been the scene of many serious accidents between different kinds of vehicles, as it is often congested with long lines of coaches and carriages going to the different cemeteries in the vicinity.

The club warns autoists of an especially vicious speed trap at Hicksville, L. I., which is unusually active on Sundays.

BAY STATE ASSOCIATION'S ANNUAL OUTING.

BOSTON, June 20.—The Bay State Automobile Association is to hold a club run and outing July 4-5 to the Hotel Wentworth, in New Castle, N. H., and preliminary announcement of plans has been made by the touring committee, consisting of J. C. Kerrison, H. G. Kemp, Ernest A. Gilmore and V. A. Charles. Those who desire to avoid the noise of the night before the Fourth may make the trip to New Castle on Friday evening, but the larger number of club members will drive down Saturday morning. The route to be followed will be over the beautiful shore roads leading through Lynn, Salem and Newburyport, the same route that is to be followed by the Glidden tour later in the month. Saturday at New Castle arrangements have been made for outdoor amusements, baseball, tennis, bathing and the like, and in the evening there will be a dance. Sunday the motorists will spend as they see fit, most of them probably taking the afternoon for the drive home. Special rates have been secured, and all are anticipating a pleasant outing.

WOMEN TO DRIVE IN ST. LOUIS TEST RUN.

ST. LOUIS, June 23.—Indications point to a great success for the second annual owners' reliability run of the Automobile Club of St. Louis. It will take place on June 27, over a course of 110 miles, the prize being the James Hagerman, Jr., trophy.

Included among the entrants is Miss Ida Britton, a sister of Roy F. Britton, a governor of the club, who will drive a 45-50 horsepower Pope-Toledo. It is more than whispered that another St. Louis society girl will also be among the contenders.

The regulations do not permit racing, and bar all automobile manufacturers, agents, dealers and every one who has in any way received compensation for driving a car. The course, which has many hard hills, will be divided into six controls.

ANOTHER NEW YORK HILL CLIMB ON JULY 8.

Several gentlemen have organized the Riverside Motor Club, and will, as such, promote a hill climb on July 8, on Depot Lane Hill, starting at the Boulevard Lafayette and ending on Fort Washington Heights, near the Arrow Head Inn. There will be eight events.

LATEST FLIGHTS OF THE AEROPLANISTS

PARIS, June 17.—All aeronauts who have given public demonstrations have been content to remain as near the ground as possible in order to be prepared for any possible failure of the motor to fulfill its functions. Robert Esnault-Pelterie, the twenty-six-year-old inventor of the seven-cylinder R. E. P. motor, has created a new record by flying to a height of about 120 feet. The operation took place at Buc, a deserted plateau on the suburbs of Versailles. Before about fifty spectators Esnault-Pelterie brought out his monoplane flying machine and made half a dozen flights of about half a mile each at a height varying from 2 to 18 feet from the ground.

The motor running satisfactorily and the aeronaut having found his bearings by the preliminary canthers, preparations were made for a longer flight. From the extreme end of the field the machine ran over the ground for a few seconds, then mounted into the air at the speed of 50 miles an hour. From a height of six feet the apparatus rose higher and higher until it was a white speck in the sky, the maximum height being certainly not less than 120 feet from the ground. In his rapid flight Esnault-Pelterie had passed over the apple trees on the edge of the ground and got beyond the limits of his training field. To the spectators he appeared to be hovering over the village of Toussu-le-Noble. Suddenly the entire apparatus was seen to descend to earth at a rapid rate. It was not sufficiently fast to be called a fall, yet too fast to be safe for the pilot.

When the spectators reached the spot Esnault-Pelterie was lying in a field of clover with his machine beside him. The pilot had been considerably shaken but had no broken bones, and a little damage had been done to the aeroplane. According to the explanation the aeronaut gave of the accident, the fall was entirely due to a too rapid manipulation of the rudders. Owing

to the rapid rate of travel, certainly not less than 50 miles an hour, the aeroplane arrived at the limit of the ground much quicker than had been expected by the pilot. Fearing that if he continued any further he would have to come down in the middle of the village, Esnault-Pelterie operated his rudders at once and descended faster than was advisable for his own safety and that of his machine. Fortunately there was no serious damage, and while the pilot is passing a few days' quiet at home he will have the satisfaction of knowing that he holds the record for height and speed. The distance in a straight line from the starting point to the descent was exactly one mile; this, of course, does not take into consideration the upward and downward curve.

Esnault-Pelterie's machine, the second one he has produced, is a monoplane having a total bearing surface of 226 square feet, weighing 770 pounds and driven by a seven-cylinder R. E. P. motor, the separate weight of which is but 80 pounds. The bearing surfaces have been so well studied that for an area of 10 square feet a weight of 45 pounds can be borne. A special type of four-bladed propeller is employed, and the normal speed of the apparatus when in the air is 50 to 55 miles an hour.

DELAGRANGE FLIES 11 MILES IN 16 MINUTES.

MILAN, ITALY, June 22.—Leon Delagrange, the French aeroplaneist, this evening surpassed all previous records by flying for 16 minutes and 30 seconds. During that period his machine was from 10 to 18 feet above ground. He made nine rounds of a measured course at the velocity of 38 miles per hour, covering about 18 kilometers, or a trifle over 11 miles.

A specially designed medal is to be given to M. Delagrange, commemorating the occasion.

HUNTING AND TRAPPING IN AN AUTO.

Four years of hunting and trapping in the Rocky Mountains in a Rambler runabout has been the unusual experience of M. C. Ramsey, Grand Junction, Col., an enthusiastic autoist. In all seasons of the year and under all road conditions, Ramsey has made long automobile excursions into the mountains after game. The car he drives is a 1904 one-cylinder Rambler and Ramsey claims to have covered several thousand miles with practically no expense for repairs.

Last February he made a 100-mile run up the western slope, and on this occasion he returned to Grand Junction with 78 rabbits as a result of three hours' shooting. The photograph shows him and his car at the highest point in the Rockies ever reached by an automobile.

How a Rambler Runabout Mounted the Rockies.

MILWAUKEE-CHICAGO ROUTE HAS NEW GARAGE

RACINE, WIS., June 20.—The accompanying photograph shows the fine new building recently erected for the Miller Motor Company, of this city, as a garage, and which will supply a much-needed supply station for tourists along the Lake Shore route between Chicago and Milwaukee, this being a much-traveled road. The building measures 45 feet in width and is 120 feet deep; it is of concrete block construction with a concrete floor, and is thoroughly fireproof. Its capacity is 40 cars, ranged along the sides of the building, so that any one may be taken out without disturbing any of the others. One of the features of the new establishment is its finely equipped repair shop, which is fitted with machine tools for all kinds of repairs. The cars shown in front of it are Pierce-Racines, which are built in this city.

New and Modern Garage Just Opened at Racine.

Where the Dow Tire Company is Now Housed.

NEW HOME OF THE DOW TIRE COMPANY.

Judging from the developments of the past year or so in this direction, New York's automobile "row" bids fair to be an assemblage of offices and salesrooms the equal of which will seldom be found in any quarter of any city, no matter how exclusive. Both the manufacturers of automobiles and the makers of accessories have located with a view to the permanency of their establishments, and the fittings and equipment of the latter are of a nature which shows that their owners have spared no expense to make them appropriate homes for the business to be carried on therein. One of the latest concerns to locate along the "row" is the Dow Tire Company, which recently moved from its former quarters in Forty-second street, to what its occupants term "the handsomest little office building in New York City," the two-story architectural gem built by the Rhinelander estate at the corner of Broadway and Sixty-eighth street.

The interior fittings are of dull finished oak throughout, and follow the general architectural lines of the building itself, so that the whole is in perfect harmony. The new quarters house a finely equipped display and salesroom, and the offices of the company, which are fitted up in a manner to set an appropriate standard for the metropolitan agencies of the tire companies, although some of the latter already have salesrooms of which their owners may well be proud. In the corner of the lower photograph, illustrating a portion of the Dow salesrooms, is shown the special machine designed to demonstrate the wonderful puncture-proof properties of the Dow nondeflation tube. This has been exhibited at all the automobile shows, and as the tire can be subjected to any load and run at any speed, after the nails or other sharp objects have been driven into it, the self-healing properties of the Dow tube are strikingly proven.

View of a Corner of the Salesrooms, Main Floor.

AUTOMOBILES AID MIMIC WARFARE.

CAMP PINE, N. Y., June 22.—One of the most important problems which the War Department is working out at the National and State encampment at Camp Pine, near Watertown, is the adaptability of the automobile for military purposes. The machines chosen for this test were two 30-horsepower Studebakers of the same model which so successfully carried General Grant's message from New York to Fort Leavenworth, Kas., last winter. One of the machines was shipped direct to Camp Pine, the other was given a preliminary test over the road. This car made the trip from New York to the camp, a distance of 354 miles, in 15 hours and 18 minutes. In the car were Lieut.-Colonel E. F. Glenn, chief umpire; Captain W. T. Johnson, assistant umpire, and Major Woodruff, chief military officer. "I was very much pleased with the trip," said Colonel Glenn, upon his arrival at the camp. "Barring one or two punctures, the car behaved perfectly and I am thoroughly convinced that it is only a question of time when automobiles will be used in all military maneuvers."

The real test of the machines began, however, upon their arrival at the camp. One of the cars is being used by General Grant and the other by his staff officers. The 144 square miles included in camp comprise every sort of rough country, full of stumps and ruts, either roads with hub-deep sand or no roads at all and

General Grant in Studebaker Car Conducting Maneuvers.

rough, steep hills. Both machines have been constantly in service since their arrival and all the staff officers are wondering how they ever managed to get along before without an automobile.

No one in the camp is better pleased with the showing made by the automobiles under test than General Grant. He uses his machine a great deal and has noted the performance of both cars very closely. He said to-day: "I should not have believed that it was possible for an automobile to go the places these two Studebaker machines have gone if I had not witnessed it myself. During the week they have been here they have been put to the most severe test and haven't been out of commission for a minute. They are especially valuable in plotting out problems where it is necessary to carry maps and other paraphernalia not easily conveyed on horseback. I believe that not only is the automobile of great value in military work but, more than that, it is a necessity. I am greatly pleased with the excellent showing made by the two machines being tested."

WHITE SQUADRON AT OYSTER BAY AGAIN.

With the return of President Roosevelt to Oyster Bay, the two government White steamers have resumed service. The two cars are now operated on the same schedule as last year, making the first trip to Sagamore Hill at 7 o'clock in the morning and the last trip after midnight. There is but little time during the day when the cars are not engaged on some official mission. Last season the two cars went through the four-months' season with a record of never having missed a trip and never having been late.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The MacDuffee Automobile Company, Chicago agents for the Stoddard-Dayton cars, have found it necessary to rent another floor in order to take care of their increasing business. It measures 30 by 161 feet and will be used altogether as an equipment room.

Following the general practice of those who are building cars for the Vanderbilt Cup race, to be held on Long Island in October, the Acme Motor Car Company, of Reading, Pa., will equip their six-cylinder entry, known as the Acme Sextuplet, with Truffault-Hartford shock absorbers.

The Moon Motor Car Company, of St. Louis, Mo., has been adding to its plant considerably during the past month. Owing to the heavy demand for Moon cars, it was found necessary to make considerable increase in the capacity of the machine shop. Additions have been made principally in the high grade grinding machines.

The Rubberized Leather Company, Gloversville, N. Y., has just completed moving into its new mill recently purchased of C. O. Bartlet on North Bleeker street, which gives additional floor space of 40,000 square feet over the former mill on Forest street. This gives the company one of the most complete and up-to-date tanneries in northern New York.

A special telegram to R. M. Owen & Company, New York, from their Chicago representatives, the Walden W. Shaw Company, reads as follows: "Eighteen consecutive centuries, aggregating 2,000 miles, just completed by Premier '30' without single mishap to car or tires. Car now going over different circuits in and out of Chicago, including Elgin and Aurora. Running as beautifully as when first started. Local autoists enthusiastic."

The Palmer & Singer Manufacturing Company announce that the entire output for 1908 has been sold and that already 16 applications are in for 1909 Simplex models. This is an indication of the power and scope of the sales organization maintained by this big concern. Within 40 days after the announcement that the Palmer & Singer Manufacturing Company had purchased the output of the Simplex factory, they had sold more Simplex cars than the entire 1907 output of the factory.

The Baker Electric roadster Model "M" was the fastest electric in the hill-climbing contest held June 13 on Porter hill, near Cleveland, O., its time, 1:00 3-5, was beaten by only five of the many high-powered gasoline cars entered. The course was one-half mile in length on a grade averaging over 16 per cent. with country road conditions. The great power developed and endurance shown fully demonstrates Baker excellence, durability and mechanical construction, and is worthy of more than passing notice.

The appearance of the Hol-Tan cars is expected to be scheduled for next week. It is believed that the new line will show a number of minor refinements in addition to the radical good points of construction which will cause them to appeal at once to the taste of the public. Coincident with the beginning of deliveries of these cars, the Hol-Tan Company will inaugurate a campaign of participation in prominent events with an idea of giving all interested a chance to see how good the car is under competitive conditions.

Midland cars, it is announced, will be seen in many of the hill-climbs and races in the East during the present season. The Allenhurst Garage, of which P. L. Toplitz is manager, has the metropolitan agency for the Midland and it is through this agency that the exploiting of Midlands will be undertaken. It is announced that entry of a car in the Wildwood, N. J., events on July 4 had been made and the car will also be seen in the Monroe county festival events on June 25 to 27. Deacon Holmes, the assistant manager of the Allenhurst Garage, will pilot the car in all its public appearances.

In the recent announcements of the Goldberg Motor Car Devices Manufacturing Company, 1253-1255 Michigan avenue, Chicago, which have been appearing in THE AUTOMOBILE, mention has been inadvertently omitted of the New York offices of the company. These are located in the recently completed Thoroughfare building, on Fifty-eighth street, extending from Eighth avenue to Broadway, and are in charge of C. S. Gibson, who was formerly with the Packard company. Under the management of Mr. Gibson, the Stromberg carbureter, as it is now known, is rapidly obtaining a successful introduction here in the East.

The Irish Automobile Club Reliability trials include an endurance run from Dublin to Killarney to Limerick to Belfast and back to Dublin, a total distance of 345 miles, beside two hill-climbs and a sand test, the winners to make the best total showing. In open Class A for small two-seated cars, the 15-horsepower Ford was the only one to make a non-stop. As regards speed in this class, the Ford made the fastest time in both the hill-climbs and the speed trial on Rossbeigh sands. The 15-horsepower Ford was also successful in Class B on the Hollywood (Slieve Corragh) hill and on Rossbeigh sands. The gold medal for all around performance was won by the Ford 15-18-horsepower, this make thereby repeating its performance of last year.

Entries covering three Franklin touring cars and one runabout have just been received by Chairman Hower, of the Fifth Annual Reliability Contest of the A. A. A., entries being made by the Automobile Club of Syracuse. This is the first time in the history of the Glidden tour that the Franklin car has been represented, the reason heretofore given being that the tour, while no doubt allowing contestants an opportunity to demonstrate some of the good points of their machines, did not, to any great extent, prevent the less able cars from qualifying in a manner which would cause it to appear that they were equal to their more worthy competitors; in short, it has up to this time been looked upon as more of a tour than a reliability contest; this, however, is not true of the coming event which, on account of the penalization system, is more severe and proves better the points claimed for the entrant's car. The fact that the Franklin is an air-cooled car, and the Syracuse team will probably be the only one consisting entirely of air-cooled cars, gives somewhat of a distinction to this particular entry.

NEW AGENCIES ESTABLISHED.

The Whitten-Gilmore Company, which has handled the Thomas line in Boston and

Eastern Massachusetts this season, has taken on in addition to the Thomas line the Chalmers-Detroit cars.

The Standard Roller Bearing Company, of Philadelphia, announces further expansion of its sales organization by the opening of a branch office at 327 Jefferson avenue, Detroit, in charge of Ernest L. Smith, recently appointed Western representative for the company.

The Bosch Magneto Company announces the opening of a new branch office at No. 1253 Michigan avenue, Chicago. This office will cover territory lying in Illinois, Michigan, Wisconsin, Indiana, and the States south and west of Chicago. A technical department and machine shop is also installed.

The unique distinction of being the loftiest motor vehicle agency in the world is claimed by the Couple-Gear Company, of New York, whose offices are five hundred feet above the ground, on the thirtieth floor of the Singer tower on Broadway. This company has taken the agency for the metropolitan district for the Couple-Gear electric and gasoline-electric trucks and delivery wagons.

One of the latest comers on Broadway is the Manufacturers' Distributing Company, who are located at the corner of Sixty-third street and Broadway. The members of the concern are John Paine, late of the Warner Instrument Company, and D. E. Sullivan. The new firm are New York agents for the J. H. Sager Company, of Rochester, N. Y., and are carrying a full line of Sager's equalizing springs, tire chains and protection bumper.

PERSONAL TRADE MENTION.

F. W. Lawrence, formerly connected with the Federal Manufacturing Company, has recently joined the sales organization of the Standard Roller Bearing Company of Philadelphia.

Charles E. Duerr has taken the New York agency for the Moon. Mr. Duerr is a pioneer in the metropolitan automobile trade. He was last associated with the selling of the Royal Tourist. Among the makes with which Mr. Duerr has been identified as a New York agent were the Searchmont, Ford, Mitchell and Queen.

Oscar E. Boles, assistant sales manager of the Lozier Motor Company, was found dead in his bed at his lodging house in New York last week. Mr. Boles was for seven years manager of the Lozier European branches at London and Paris. In his younger days Mr. Boles was a cycle man of prominence on the Pacific Coast and manager of different bicycle agencies at Denver.

T. D. Grimke Drayton, chairman of the board of directors of the parent company in England of the Spare Motor Wheel of America, Ltd., is now in this country and is much pleased with the progress made by the American branch since his last visit here. The company has recently closed agency contracts with ex-Mayor Sherburn Becker, of Milwaukee, who acts as distributor of the Stepney spare wheel in the State of Wisconsin, and W. B. Drown, formerly of the Auto Parts Company, of Cleveland, O., who will act as representative in that city.

INFORMATION FOR AUTO USERS

Rands Rumble Tops.—Ever since the advent of the type of car with a rumble seat in the rear, it has been a question, what type of top such a car should carry. Where it was intended that only the chauffeur should occupy the seat in the rear, the problem was solved by not covering the rumble seat at all, but as the double rumble is usually intended to carry passengers, the problem was still open. The Rands Manufacturing Company, Detroit, Mich., who make a specialty of automobile tops of every kind, have taken up the problem and solved it in a manner that will please the particular autoist. This new Rands top is so made that the bow crossing the entrance to the car has been entirely done away with, so that when the top is folded it is very compact and projects but little behind the rear seat. The desired effect for such a car has been accomplished in this manner, while still keeping the top light, yet very strong.

Star Speedometer.—This is a newcomer to the field of speed and distance-recording instruments on the automobile and is the product of the Star Speedometer Company, Danville, Pa. It is of the familiar centrifugal type so largely employed for this purpose, and is very well made throughout, so that the makers feel safe in guaranteeing it unconditionally to be accurate under all road conditions. It is made in several styles with 60 and 100-mile scales, one of its exclusive features being a "catch the speed" device. By pressing a knob on the front of the case the indicating pointer can be stopped at the exact speed the car was running at the time the knob was pressed. The odometer used is an exclusive product with this concern and is a specially constructed locked wheel device. Right angled connections at the instrument are used, thus bringing the driving shaft in a straight line from the wheel to the speedometer.

STAR SPEEDOMETER.

Reliable Self-Starter.—That there is a widespread demand for a self-starting device on the automobile is a matter for common knowledge. Many attempts have been made to meet it in the past, but with few exceptions the devices presented have failed to combine the qualifications of simplicity and compactness with ease of operation so that at the present moment there is nothing of this nature on the market that is in general use. The Beamer Manufacturing Company, Detroit, Mich., appear to have struck nearer the solution of the problem than has been the case heretofore. The device is termed the "Reliable" self-starter and a review of its specifications shows that its inventor has had in mind the essentials above mentioned. It consists of a nest of multiple cylinders and plungers combining a gasifier and pump that can be located on the footboard or under the hood, with the operating handle within easy reach of the driver. By a very simple method, a small amount of gasoline is mixed with air, and vaporized, and the

resulting fuel gas is forced through copper tubing direct to each cylinder, a few strokes of the handle being sufficient to charge the motor so that it will start promptly and positively upon the ignition circuit being closed. The device complete can be installed in half an hour by an ordinary mechanic and no changes whatever are necessary to the motor. For a four-cylinder motor the Reliable measures 6 by 7 inches and weighs 15 pounds, and the makers guarantee it to start a motor from cold every time.

RELIABLE SELF-STARTER.

McGiffin Windguard.—This is an all-metal type of windshield, using a hexagonal brass frame, the latter being reamed out and lined with rubber to admit the 3-16-inch plate glass employed. This frame is attached to a hinge by two taper pins and the hinge is fastened to the base by pivoting lugs. The base can be filled with glass or hard wood. The telescoping rods supporting the windguard have balls on both ends and fit into sockets mitered and bolted to the frame at the top, and to a foot block at the bottom. These rods are operated by thumb screws, thus dispensing with the use of any tools to make adjustments. A new glass can be inserted in less than ten minutes. It is manufactured by the Automobile Specialty Company, 620 Maryland avenue, Pittsburg, Pa.

Indicator for Autogas Valves.—This is a handy little device that has just been brought out by the Avery Portable Lighting Company, Milwaukee, Wis., manufacturers of the Autogas tanks, and is designed to act as a regulator on the gas tank valve. It consists of a circular brass disc back of the handle of the valve, and over the face of which a spring clip passes as the stem of the valve is turned. In this disc are countersunk a number of recesses around

A HANDY VALVE FOR ACETYLENE TANKS.

the entire circumference and the spring clip is equipped with a punched-up boss that corresponds with these recesses, so that the opening of the valve is really accomplished by a number of short steps instead of a continuous movement. This enables the operator to learn exactly how many

notches the valve has to be opened to light a certain number of lamps, and, once this is known, it is a simple matter to remember to open the valve to exactly that point each time. The signal is audible as well as visible, as the clip makes a distinct click in dropping into each recess, so that the extent of the valve's opening is as easy to judge in the dark as otherwise. Two notches are said to represent a sufficient supply of gas for lighting two lamps.

Dover Measure and Funnel.—This is a new combination recently brought out by the Dover Stamping & Manufacturing Company, Cambridge, Mass., and it is one that will be greatly appreciated by the autoist, for there is probably no one thing about the tool kit of an automobile that is so frequently mislaid as the funnel. They are made in five different sizes, ranging half-pint in capacity to one holding four quarts, and are ordinarily made of extra heavy polished tin. For automobile use, particularly where wanted for gasoline, they are copper plated, and are furnished with a well-made brass wire strainer inserted. The pint size only measures 3 1-2 by 5 3-4 inches, thus making it a handy article to carry in the tool box.

DOVER FUNNEL MEASURE.

Oxyacetylene Welding Outfits.—The use of the oxyacetylene welding process is becoming more and more general in automobile construction, and the Beltzer Decampe Welding Company, Bridgeport, Conn., are now turning out portable outfits especially adapted for this work. These consist of a portable oxygen generator; a portable automatic acetylene generator; a blowpipe permitting the welding of sheets of every thickness up to 1 1-4 inches, and the repairing of castings of any dimensions; also a blowpipe for the rapid cutting of steel to any desired shape, it being possible to cut plates as thick as 2 inches, cross rods inserted, then a circumferential wire ring and alternate rubber section and wire ring, until the proper width is obtained with marvelous rapidity. The complete outfit weighs 700 pounds. Commercial plants capable of running six blowpipes continuously, are also made a specialty of. According to its capacity, either is particularly adapted to the welding of wrought or cast iron, this firm having discovered a special process for accomplishing the latter, steel, sheet iron work, piping, copper, etc.; repairing all kinds of castings, the making of seamless tanks, local annealing, the rapid and economical cutting of steel, beside many other uses.

Edison Double System Spark Plug.—This plug, manufactured by the Edison Auto Accessories Company, Thoroughfare building, Broadway and Fifty-seventh street, New York City, contains two separate electrodes, one for connection to magneto and one for connection to battery, and is intended to take the place of the double set of plugs as are now used on most cars. Cars having only one set of ignition can now have two by connecting the storage battery on one electrode and dry cells to the other. The makers claim that aside from this feature the plug cannot short circuit, and that water, oil, carbon or soot will not affect it in any way.

NEW AUTOMOBILES that are strictly guaranteed, bought for cash, of overstocked manufacturers at forced sale prices, for immediate delivery and quick sale profits. They include Dolsons, Queens, Dragons, Orient Buckboards, Waithams, and numerous others. Apply for descriptive list and prices. If you are about to buy a second-hand car, do not fail to consult us. We have on our sales floors and ready for delivery, about every make of automobile there is. They are all substantial and well built cars that have been thoroughly overhauled in our shops and are equal to new both in reliability and appearance. We ask you on an average about one-fourth the original cost. They range in price from \$250 to \$3,000. We will gladly mail you our weekly list upon request. We have the largest and most complete stock of automobile supplies in America, and can give you cut prices on everything. We make a specialty of tires, have an immense stock on hand, of the best makes and can give you bargain counter prices. Send for our new 100-page catalogue and souvenir. The former is a dandy, and the latter, unique. Times Square Automobile Co., largest dealers in new and second-hand automobiles in the world, 1599 Broadway, New York, and 1322 Michigan Ave., Chicago, Ill.

WE are going to sell every second-hand car we have regardless of their real value, as we must have the room for other purposes. These include some exceptionally fine propositions, from two-passenger runabouts to seven-passenger touring cars. Get our list and make us an offer. E. R. Thomas Motor Company, Second Hand Department, 1200 Niagara St., Buffalo, N. Y.

WE EXAMINE, overhaul and repair every car that we offer for sale. We give demonstrations cheerfully. We carry the largest stock and sell at the lowest margin of profit. We always have from 100 to 250 cars to select from. Write for weekly list. Two hundred and fifty cars best standard makes—Packards, Pierces, Mercedes, Hartfords, Knox, Lozier, Stevens, Columbias, and in fact, any and every make, at fraction of list. See us first. Auto bodies of our own make and to fit any car, always ready. Broadway Mammoth Automobile Exchange, 245 West 56th St., New York City.

WE ACT AS BROKERS for the quick sale of second-hand cars. We charge the owners only 5 per cent. commission. In this way we get a great many bargains from owners who, for various reasons, want money rather than the car. We can put you in touch with the owner, and you can often buy at your own price. We have always on hand from 100 to 200 cars of practically every make. We issue a weekly list of cars on hand which we will mail you on application. The following are special snaps for this week: Locomobile, 20-25-h.p., 4-cylinder touring car, top, three extra shoes, speedometer, odometer, tools, lamps, etc.; cost \$2,850. Matheson 4-cylinder, 45-50-h.p. touring car for \$2,500; full lamp equipment, 2 horns (1 Gabriel), luggage carrier, 7-passenger; magnificent; cost \$5,500. Parts and Accessories (WANTED)

WANTED—Second-hand Orient Buckboard tires. Freedman, 2545 E. 55th St., Cleveland, O.

WANTED—Manufacturers, attention! Hustler in Chicago having successfully introduced automobile accessories and specialties and being favorably known to Western trade, is now open to introduce, or handle, other lines of genuine merit in Chicago and vicinity. Can prove results. Can sell parts, chassis, frames, transmissions, engines or specialties. If you have something good, address H. W. B., care The Automobile.

Situations Wanted

DRAFTSMAN-DESIGNER, desires position; long practical experience, thoroughly in touch with latest practice, and competent to assume entire charge of drafting and designing departments. For references and complete particulars, address Box 81, care The Automobile.

ENERGETIC man directly connected with the automobile business from its start, and thoroughly conversant with design and practice will consider change. Good opening with factory working along lines of future demand preferable. Address Box 17, care The Automobile.

FIRST-CLASS MECHANIC and chauffeur desires position driving; five years' experience, driving and repairing all makes of gas cars. Sober; best references. Address Box 165, Hampton, Iowa.

POSITION wanted by expert auto repair man as chauffeur. Address Matthews, care of The Automobile.

SALESMAN calling on New England garages and dealers would like good side line. Salary or commission. Address S. C. S., care The Automobile.

SALESMAN wants agency for specialties, or a line suitable for the New England automobile trade. Address Box 780, care The Automobile.

SITUATION wanted by chauffeur; thoroughly understands his business on all cars; reference from last employer. D. A. Huppig, 115 Stagg St., Brooklyn, N. Y.

Help Wanted

WANTED—By a prominent automobile manufacturer, salesman of experience as district manager. Address, giving experience, references, and salary expected. Box 33, care The Automobile.

Insurance

INSURANCE for automobiles—Broad, safe policies at lowest prices; insurance against fire, self-ignited explosions, transportation hazards, theft, etc.; best services guaranteed, no matter where insurer is located. For particulars, address H. W. Beals, 76 William St., New York City. Phone, 3052 John.

INSURANCE for motor cars against every risk, including fire, explosion, self-ignition, theft, collision, accident, transportation, perils and other damages; cars insured anywhere in the world by the kind of "Policies that Protect," at the lowest rates of premiums; automobile bail bonds to cover all States; demonstrating policies for the trade. Dixie Hines, Times Building, New York City.

Schools

THE AUTOMOBILE industry offers a great opportunity for the ambitious man to secure a permanent paying profession. Its growth has been marvelous. It is yet in its infancy. New York City alone will require within two years 5,000 taxicab drivers; commercial vehicles as many more. A competent, careful driver is always in demand for pleasure cars. The supply is limited and the salaries high; the associations are first-class. We can make you a skilled driver, mechanic and salesman. Also course on automobile designing. Write us now for prospectus of terms, etc. New York School of Automobile Engineers, Inc., 146 West 56th St., New York City.

817 MEN who enrolled in our automobile school last season say their time and money were well invested. Our courses are thorough and practical. We have a large garage, completely equipped, and expert instructors. The school is not run to make money, but to give men a thorough course of instruction at a minimum cost. Catalog sent on request. West Side Y. M. C. A., 310 West 57th St., New York City.

Miscellaneous

Automobile Catechism

For the Use of Owners and Drivers of Cars
Fitted with Internal Combustion Motors

By FORREST R. JONES, M. E.
President of the Manhattan Automobile School

Size 4½ by 7 inches.

Pages, 134

With Drawings

Price, in Genuine Morocco Cover, Gilt Edges, \$2.00, including postage

THIS is the most practical, up-to-date work on the subject in the English Language. It is published in pocketbook form, with high-grade leather cover, and printed on especially tough paper, as it is intended to be the inseparable companion of the autoist when on tour. Not a line is wasted on obsolete constructions or descriptions of unfamiliar apparatus. It treats of the automobile in modern form and of all the troubles that may arise in the course of ordinary use and that may be remedied by the driver himself. It is written in plain language and is the most helpful, authoritative, and comprehensive manual that has yet appeared. The subject matter is in the form of question and answer, and an exhaustive cross index makes immediate reference possible in any particular case.

"BREECH-BLOCK" PLUG
 WITH IMPROVED CLIP and HANDLE
 IF you are not particular, any old plug will do, but if you want the Best Plug, a plug that is always dependable—insiston the "Breech-Block." Write for full particulars or let us send you a sample Plug.
 The Standard Co., Torrington, Conn.

20th CENTURY TIRE PROTECTOR
 Absolute Tire Protection
 No possibility of Punctures, Blowouts, or Skidding, as the "20th Century" protector not only covers the tread but the ENTIRE TIRE, Protecting it from water, sand, rock, etc., which always get between the tire and protector in other makes. Our patent mechanical way of attaching them to the tire makes them fit perfectly. They cannot budge after once on the tire. Made of finer and heavier material than any other. They cost a great deal less than a regular tire and will wear four or five times as long. Automobillist.—You need this. It will save Money, Time and Trouble. Let us explain full details of its many advantages over all others. Write for full particulars to-day.
 THE PERKINS-CAMPBELL Co., Licensed Manufacturers
 622 Broadway, Cincinnati, Ohio

HOW TO RUN AN AUTO
 Are You Interested in Automobiles?
 If you are, an early purchase of "HOMANS' SELF-PROPELLED VEHICLES" will prove a good investment.
 This work is now the accepted standard on the practical care and management of motor cars explaining the principles of construction and operation in a clear and helpful way, and fully illustrated with many diagrams and drawings.
 The presentation of subjects has been determined by consideration of the needs of the man behind the wheel. It is clear and concise in its treatment and comprehensible to the most inexperienced automobilist, at the same time it is so thorough that the expert will learn much from its pages.
 This good book will be sent to any address in the world postpaid, upon receipt of two dollars, or if desired, will be sent on approval to be paid for after examination.
 Contains 608 pages, over 600 diagrams and illustrations, printed on fine paper, size 5 1/4 x 8 1/2 inches with generously good binding.
 Highly endorsed.
AUDEL & CO.

NOTICE

Having cautioned both trade and public at various times against making, selling or buying tire covers and spare tire holders that infringe our patented Gilbert Tire Covers and Gilbert Spare Tire Holders, we are now compelled to protect our interests regardless of the unpleasant results to those who have not heeded our warnings.

We have retained a prominent law firm who make a specialty of this work, and they have taken this matter entirely off our hands. Suits will be brought against those who are using, have in stock, offer for sale, or make articles that infringe our patented goods.

Water and heat proof.
Sizes 2 to 8-cyl. (inclusive). Write for catalog.

UMCAS SPECIALTY CO., Norwich, Conn.
High Grade Ignition Specialties

THERE IS A REASON

With the same radius, frictional area and spring pressure, the **Hele-Shaw Clutch** is three times as powerful as any flat plate clutch made. Therefore, with the same radius and frictional area and one-third the spring pressure, the Hele-Shaw Clutch will transmit as much power as any flat plate clutch. Hence, it is more flexible, softer in engagement, less liable to heat, less subject to wear. It is no experiment—there are 12,000 in operation in Europe.

Specify the Hele-Shaw Clutch for the car that you buy. It can be easily fitted. Your dealer will readily comply this year to make the sale. Write for particulars.

STEEL TIRES

FULL OF AIR CAN'T BLOW OUT

This steel armor can be put on over any old thrown away tire and tire will last indefinitely; how can it get away if encircled by steel? The steel link bands hook to rim.

ANTI-SKID

Kimball Tire Case Co. 171 Broadway COUNCIL BLUFFS, IA.

Relieves You of All Tire Worries

Owner has a positive feeling of security and knows that if a tire puncture or a blow-out occurs, neither he nor his guests in the car will suffer inconvenience or delay, for if anything of the kind does happen, it is merely necessary for the driver to step from the car, snap on a STEPNEY and be on his way in less than one minute.

A necessary equipment
to every car

STEPNEY SPARE MOTOR WHEEL

You never know when you are going to have a puncture or blow-out. It's liable to happen anytime, anywhere, in town or on tour—but when it does, as it will often, that's when the "STEPNEY WHEEL" gets in its good work, where it "makes good" as the greatest invention of the age for the automobilist in trouble. It eliminates the worry, delays and expense incident to tire troubles and insures a speedy trip over all kinds of roads.

None of the make-shift devices imitating the GENUINE "Stepney" wheel are to be compared with it in any way.

HOW IT WORKS

In brief, it consists of a metal rim without felloe, spokes or hub, on which is carried an inflated tire. When not in use the wheel is carried on the side of the car in exactly the same manner as a spare shoe. On a puncture occurring, the deflated tire is left undisturbed, and the STEPNEY attached to the wheel by means of three or four clips—according to size of wheel—fitting over the clincher lip of the permanent wheel. Two of the clips are rigid and two are adjustable by thumb nuts, all that is necessary to secure the wheel being to get the fixed clips in position and tighten up on the adjustable ones, the use of a jack under ordinary circumstances being superfluous. To prevent creeping of the STEPNEY around the fixed wheel a metal lip on the smaller sizes engages one of the spokes. For the largest wheels a couple of leather straps are passed around the clip and a spoke. No tools whatever are required for mounting the wheel, the time occupied is but a few minutes, and the STEPNEY can be run hundreds of miles with safety. The STEPNEY has made good on its own merits. It does away with all tire troubles. It leaves your mind free from all worries about punctures and blow-outs. You should have one on your car.

NIGHTINGALE WHISTLE DEMANDS RIGHT OF WAY

It is the best warning signal obtainable, and possesses many distinct advantages. It can be heard for miles, but is not harsh and rasping like ordinary signals. It has a SIX NOTE TRILL, melodious and pleasing to the ear. It never fails and is ALWAYS reliable. Cannot become clogged, for it is closed when not in use and cleanses itself AUTOMATICALLY. Any chauffeur can easily attach it to exhaust pipe or muffler. Operates from ANY PART OF CAR by hand-pull, lever or pedal.

Reputable dealers wanted to represent us in cities where we have no agents.

HERE is proof that the entire country is awaking to the structural operative and economical advantages of the

Over Any Other Car

Elmore Town Car \$2,250.00
Elmore Taxicab - 2,250.00

In spite of the fact that ours is the only factory in America to increase its output over 1907, almost every Elmore agent is confronted with a shortage of cars.

Not only would most of the agents gladly pay a premium for more cars, but we have been compelled for two months to refuse requests for new agencies and requests from our larger dealers for an increased allotment of cars.

Surely this condition should prove beyond question the fact that the entire country is awaking to the structural, operative and economical advantages of the valveless, two cycle Elmore over any other car. The time is past for an argumentative discussion of these advantages. They have of themselves pushed the Elmore into a position which makes it the most-talked-of car in the automobile world to-day.

Elmore Manufacturing Co.

1304 Amanda Street
CLYDE - OHIO

HOW CAN YOU INCREASE YOUR HORSEPOWER 25%?

By cleaning out the carbon deposited in cylinders, piston heads, piston rings, valves and valve stems. Every engine is affected by carbon deposits, and its efficiency decreased twenty-five and even fifty per cent. Engines carbonize as readily, and on the same principle as a lamp chimney smokes up. The only way to recover this lost horsepower is to dismount and clean the engine, or to use

DECARBONIZER

Decarbonizer is a harmless, oily compound which dissolves and removes the carbon. You simply pour it into the cylinder, start your engine, and it immediately volatilizes the carbon, in which form it passes out exhaust as smoke.

It is absolutely harmless to metal. It cleans out and brings your engine up to maximum horsepower, increasing it, on the average, 25%.

Your engine, right now, undoubtedly is not doing its best work because of carbon deposits. Decarbonizer will remove it immediately, and used periodically, will keep your engine to top notch efficiency, and perfectly lubricated.

Don't take our word for it, prove it yourself. Use one-half of a quart can and if you are not positively satisfied that decarbonizer "makes good" on all our claims, return it at our expense, and we will refund your money.

Don't lose time in restoring your engines to their maximum horsepower. Fill out and return the attached coupon today.

GENERAL ACCUMULATOR & BATTERY CO.,
150 Second St.
Milwaukee, Wis.

RETURN THIS COUPON.

General Accumulator & Battery Co. I enclose herewith \$1.50 for which please send me a quart can of Decarbonizer, with the understanding that after having used one-half, I may return it at your expense, and receive back my money, if I am dissatisfied with results.

ONE YEAR GUARANTY

Our purpose has been to build the best car in all the world. How well we have succeeded is told by our customers themselves, who, as a class, are the most prominent men of affairs in this country. Send for our complete catalogue and book of customers' letters, of which the following is but one:

ANDOVER, Mass., January 7, 1908.
In reporting on the work of my Matheson for the season, I have to say that it has come nearer being the ideal touring car that I have been eight years hunting for than anything else I have had. It has speed over sixty miles per hour with five people aboard and power on the hills and yet runs slowly without fuss or bother in traffic in towns—eight miles per hour being easy, smooth and comfortable. It rides easier and has cost less for repairs than any of the twenty-two (22) cars I have previously had and I have driven it 13,000 miles since I got it June 7th last and to day I think I drove it faster than any time before, over sixty miles per hour with five passengers. It is by far the easiest car on tires I have ever had. One tire made 11,800 miles, one 8,800 and the others from 4,000 up.

I know you will be as glad to hear as I am to tell of the satisfaction I have had with the car.

(Signed) HARLAN W. WHIPPLE.

Note.—There is no better known or more exacting motor car enthusiast and sportsman in this country than Mr. Harlan W. Whipple, ex-president of the American Automobile Association

APPERSON CONSTRUCTION

In the building of "Famous Apperson Cars" no freak ideas are incorporated. Their universal supremacy is due to the employment of correct mechanical designs and ideas that have been developed by practical automobile mechanics and engineers during the fifteen years that the Apperson Bros. have been solely engaged in developing and building high grade motor cars. Apperson Bros. have had more experience in this line of manufacture than any other builder in America. In motor car construction it is experience that counts.

Dealers should investigate our New Model O which will sell at a low price.

KAR

4 Cylinder, 40 H. P. Selective
Type Transmission. Timken Roller
Bearings. Floating Type Rear Axle.

The Kessel Kar represents maximum ability per horsepower, which means that the power is so rightly applied—that the mechanism is so correctly designed that the maximum energy generated in your motors is transformed into moving power for your machine—into speed—hill climbing power—and ability to master hard, difficult roads.

Every ounce of the Kessel Kar's 40 H. P. counts—that's the secret.

Compare the Kessel Kar with the specifications of the higher priced car. They are the same. Yet the Kessel Kar costs \$2,000—from \$1,500 to \$1,000 less. Isn't that enough to make it worth while to write for a catalogue and investigate? Roadsters and touring cars, \$2,000. Write for catalogue.

One Accident Here—

Would mean a repair bill that would cost more than Prest-O-Lite would cost in ten years. One hard jolt, breaking a spring, would be enough to prove that Prest-O-Lite is not expensive.

Yet some people are constantly risking life and property, groping in the dark, tinkering with a gas generator, ruining their lamps, soiling their clothes, losing their temper, getting treacherous light all the time and often no light at all—

Trying to save two or three dollars a year, and not succeeding at that.

Over 40,000 motorists know that there is

no cheaper light, no cheaper insurance, than you get with a Prest-O-Lite gas tank.

A flood of steady, white, dependable light, turned on and off like a gas jet. Supplies two ¼-foot burners for 60 to 200 hours, depending on size of tank. Simply exchange an empty tank (dial shows when) for a full one.

CAUTION:

When exchanging an empty tank, don't let anyone sting you with an imitation that can't be refilled promptly or can't be sold at a good price.

120 Miles An Hour With Bosch Magneto

NAZZARO driving a 175 "horse" Fiat on the Brooklands Automobile Track, London, England, traveled two and three-quarter miles at the rate of 120 miles an hour. This is without question the most wonderful speed demonstration known to the world.

Perfect ignition was largely responsible for the placing of this new record. Naturally the BOSCH MAGNETO was used. The better class of motor cars all over the world are equipped with the Bosch System of Ignition.

Bosch Magneto Co., 160 W. 56th St., N. Y.

BRILLIANT RECORDS OF VARIOUS TIRES

are always interesting. But not so interesting to *you* as the genuine assurance that the tires you buy shall be the kind that make the records good. Our unequalled factory efficiency makes impossible a single flaw in the entire output of

PENNSYLVANIA Clincher Tires

How we alone have achieved this, we tell in detail in "*Factory Facts*," our new book. Write for it and *read* it.

PENNSYLVANIA RUBBER COMPANY

CLEVELAND: 2134-6 East Ninth St.
CHICAGO: 1241 Michigan Avenue
BOSTON: 167 Oliver Street

Camps of Short Range

throw a brilliant glare on the road close to the car, but they defeat their own object by doing so, since the driver's eyes are partially dazzled, and he cannot see clearly past the brightly lighted area to the fainter illumination beyond.

For high speed and safety, it is essential that the projected beams shall not strike the road too close to the car. It is also essential that they shall not scatter. The ideal equipment

for a touring car of medium power, is a pair of 9-inch Rushmore Headlights with their burners set slightly out of focus to spread the rays, and a 10-inch Rushmore Searchlight on the dashboard, with its burner set exactly in focus, for the longest possible range. The searchlight not only enables one to see what he is turning into, but supplements the headlights by adding its more concentrated and longer beam to those of the latter. With such an equipment one can see the road perfectly for from 100 to 200 yards, depending on its color, and guesswork is entirely eliminated.

The best article in any field sets the standard for its kind. For eight years, Rushmores have set the pace in automobile lamps, and today they are still the most powerful and most durable in the world.

A stone wall and hill. The car is equipped with Rushmore Headlights, Searchlight and Generator.

RUSHMORE DYNAMO WORKS PLAINFIELD, N. J., U.S.A.—
LONDON, PARIS, CHICAGO

OVERLAND VICTORIES

Overland cars do not have to rely on past performances. Each event in which they are entered adds to their list of victories. The following list of recent events should interest every intending purchaser:

Indianapolis Hill Climb, March 24, '08..... First Prize
Fort George Hill Climb, April 9, '08..... Second Prize
Indiana Reliability Run, May 20, '08..... Perfect Score
Cincinnati Hill Climb, May 3, '08..... Second Prize
Bridgeport, Conn., May 3, '08..... First and Second
Williamsport, Pa., June 6, '08..... Two Firsts

You take no chances when you buy the OVERLAND. Every car is built right to the smallest details. 20-22 h.p., 4-cylinder, shaft drive, 96-inch wheel base, full elliptic springs, transmission and differential in one housing on rear axle, NO SIDE LEVERS. Write for catalogue.

The Auto-Meter Is Believed

Talk about speed indicators that are believed—that have figured largely in famous events! Here are a few right off the reel—just jotted down from memory! The reviewing of big motor events is nothing more or less than a history of the successful career of the Auto-Meter.

Glidden Tour, 1906, 38 Warner Auto-Meters used; all other makes, 23. Memorial Day Races, Denver, 1906, Thomas "40" won 1st; Stevens-Duryea, 2nd; both Warner-equipped.

Mudlark, 1906, from New York to Daytonia, Warner-equipped; big tour afterward.

Memorial Day, 1906, non-stop run, New York-Boston-Springfield, Knox Waterless made record, Warner-equipped.

Franklin Car, San Francisco-New York, 4500 mile run, August, 1906, Warner-equipped.

Percy Megargle with Req Mountaineer, across continent and back, 12,000 miles, 1906, Warner-equipped.

Military Message Run, Chicago-New York, June, 1906, Buick car, Warner Auto-Meter.

Military Run, New York-San Francisco, Aug., 1906, a Warner was used.

Red Cloud, Oids, Trans-Continental Run, 1907, Warner equipped.

Glidden Tour, 1907, 75 cars started; 53 used Warners; 21 used other makes.

The fire departments of the following cities use the Auto-Meter: New York, Boston, Detroit, Chicago, Denver, Joplin, Mo., and Seattle, Wash.

All the reliable maps of the country have been laid out with Auto-Meters. The Blue Book, White's Route Book, all Canadian maps, Michael's Pictorial Maps, all Glidden Tour courses, King's Maps, Briarcliff Course, etc.

Nearly all the automobile makers of the country use the Auto-Meter to test their cars before leaving the factory.

The E. R. Thomas Motor Co. and the Oids Motor Car Co., furnish the Warner as part of the regular equipment.

Detroit Reliability Run, 1907, winner used Warner.

New York-Chicago Sealed Bonnet-Contest winner Warner equipped.

Cleveland Pathfinder to Ormond, Warner-equipped.

Long Island Economy Run, Frayer-Miller winner, was Warner-equipped.

In New York-Paris Race only speed indicator in the run is a Warner Auto-Meter.

Ralph Owen, driver of Mudlark, 1908, bought a Warner for his car though offered another as a gift.

Winning Haynes car in Chicago Reliability Race, December, 1908, was Warner-equipped.

Charles J. Glidden, has piled up 42,367 miles in 35 countries with a Warner Auto-Meter.

Warner Instrument Co., 209 Wheeler Ave., Beloit, Wisconsin

The Severest Tests

have demonstrated time and time again that the principles employed in

Timken Roller Bearings

are the only correct ones that insure perfect transmission of all power to traction use, eliminating both friction load and end thrust.

A **Stoddard Dayton** Stock Car equipped complete with **Timken Roller Bearings** finished April 12th, a ten-day century run, 1,000 miles over the roughest roads with all adjustments sealed, something impossible for a car equipped with the ordinary type of bearings to perform.

This car, as are all cars of the **Stoddard Dayton** make, carries a full equipment of **Timken Roller Bearings**, as tests made under the most adverse and severe conditions have proven them an economical factor in the saving in wear and tear from strain alone.

And these are some of the reasons why more than 65 per cent. of all the makers of high grade American Automobiles and over 90 per cent. of the Commercial Truck builders are now using them.

Are you? If not, won't you let us give you some figures that prove? These are yours for the asking.

The Timken Roller Bearing Axle Co., - Canton, Ohio

FRANKLIN Automobiles

“Why don't more manufacturers build air-cooled automobiles?”

Last winter in Chicago the air-cooled Franklin Type D, a five-passenger automobile, ran idle a week continuously in a warm salesroom. Other Franklins of the same type ran idle indoors in Philadelphia 24 hours; in Washington, 60 hours; in Baltimore, 72 hours. At Cincinnati a Type D ran on the road and in the salesroom 440 hours without stopping.

No water-cooled motor can run idle under its own cooling system. The Automobile Club of America in making its dynamometer tests on water-cooled automobiles had to rig a powerful extra fan to prevent their overheating.

In all the water-cooled automobiles yet built the hot dead gas of the explosion is held in the cylinder until the end of the exhaust-stroke. The Franklin auxiliary exhaust gets rid of this useless heat immediately after the explosion.

Franklin air-cooling has nothing to steam or boil; nothing to freeze in winter. It gets more work out of the fuel. It gets rid of complicated apparatus and trouble and bother. It gets rid of useless weight.

This gives more ability for the power. It saves gasoline and tires. It lessens the wear and tear.

A light automobile does not strain and rack itself on the road as much as a heavy one. All this brings down owning-cost and depreciation-cost.

You can't build a water-cooled automobile as efficient and able as an air-cooled one; nor as economical. Yet you often hear the question “If air-cooling is a success why don't more manufacturers build air-cooled automobiles?”

The answer is: Successful air-cooling is possible only through experience and inventive skill. We have been developing the Franklin steadily along the same line for six years. But anybody can build a water-cooled motor.

Why are there no more turbine steamships? Of all the great ocean liners only three have turbine engines—but they are the latest and finest ships; and they hold the trans-Atlantic records.

The air-cooled Franklin is the only automobile that was ever able to run from San Francisco to New York in 15 days; or from Chicago to New York in less than 40 hours. No stock automobile but a Franklin ever ran 50 miles in 57 minutes 43 seconds.

Automobile users are learning the facts, Franklin sales have increased 40 per cent even in this “off” year when automobile sales generally are away below normal.

Manufacturers are beginning to realize that only the fittest will survive. More of them would build air-cooled automobiles if they could.

They will when they learn how

WHITE WINS

A Partial Summary of Victories, May, 1907-May, 1908

PERFECT SCORE IN HARRISBURG ENDURANCE RUN

Tying with three other cars in the contest of May 5th-6th, 1907. For the result of the "run-off," see below.

FASTEST TIME IN WILKES-BARRE HILL-CLIMB

Defeating 45 high-powered gasoline cars, in the great contest on Decoration Day, 1907.

FASTEST TIME IN CLEVELAND HILL-CLIMB

Defeating 40 high-powered gasoline cars.

FASTEST TIME IN CALIFORNIA HILL-CLIMB

Defeating the fastest of its gasoline competitors by nearly two minutes on the 2 7-8 mile hill at Witter.

PERFECT SCORES IN SEALED BONNET CONTEST

Both White cars entered made perfect scores in this contest conducted by the Automobile Club of America.

OFFICIALLY OBSERVED NON-STOP RUN OF 1871 MILES

Held under the auspices of the Royal Automobile Club of England and certified by that organization.

FASTEST TIME OF THE SEASON ON THE TRACK

One mile in 1:02, ten miles in 12:54 and twenty-five miles in 29:07 at the Santa Rosa Track Meet.

OFFICIALLY DECLARED MOST EFFICIENT CAR

In the South Harting hill-climb, conducted by the Royal Automobile Club, the White won the contest because it developed at the rear wheels a greater percentage of its assigned horse-power than did any other car. The rating assigned to the White was 50 horse-power.

WINS ENGLISH DUST TRIALS

Proving officially that it raises less dust than any other car.

CLEAN SWEEP IN THE GLIDDEN TOUR

Three White entries make three perfect scores.

WON HOWER TROPHY

The single White runabout entered in the Glidden Tour defeated a dozen high-priced gasoline runabouts competing for this prize.

WON CALIFORNIA RELIABILITY CONTEST

In the original contest held September 20th, two Whites tied with two gasoline cars. In the "run-off" held November 15th and 16th, both Whites made perfect scores while both gasoline cars were penalized.

WON QUAKER CITY ENDURANCE RUN

In this contest, held January 1st, 2d and 5th, the White vanquished 27 gasoline cars of 23 leading makes, winning the MacDonald & Campbell trophy.

FASTEST TIME IN SAN FRANCISCO HILL-CLIMB

Winning the free-for-all, the \$2,500 class and the \$3,500 class.

FASTEST TIME IN THE NEW YORK CARNIVAL HILL-CLIMB

Making the ascent of Fort George hill in 32 1-5 seconds, compared with the best gasoline time of 36 seconds; largest entry list of any hill-climb ever held.

NEW SAN FRANCISCO - LOS ANGELES RECORD

The White car made the 478-mile mountainous journey in 17 hours and 17 minutes, cutting 56 minutes from the previous figures.

DOUBLE VICTORY IN HARRISBURG ENDURANCE RUN

The single White entry was the only touring car to make a perfect score, winning the principal 1908 trophy, the Board of Trade Cup, and also the 1907 prize in a "run-off" with last year's other perfect-score drivers.

Ready for delivery
July 1, 1908

Chalmers-Detroit

"It's a good car"

A 4-cyl., 5-passenger, 24-30 h.p. car. Made by the makers of the Thomas-Detroit Forty.

This Astounding Car for \$1,500

A millionaire's car brought by mammoth production down within reach of the many. Looks like the costliest cars—does all that the costliest do. Yet so low in price, so economical in upkeep, that fifty times as many people can now own a powerful, high-grade car.

For two years—after we perfected the Thomas-Detroit Forty—we have worked to perfect this car.

Not to sell at \$1,500; for nobody dreamed, two years ago, that such a car could ever be sold for that. We simply aimed at perfection in a light-weight car—a car with low cost of upkeep. We expected the cost to run at least \$2,000.

But the panic last fall cut the prices of materials, and we are giving you the benefit of our ability to purchase ahead.

Note that this car is not an experiment—not a hasty makeshift. We have worked for over two years in perfecting it. Three of the new cars have been run over 7,000 miles.

Designed by Mr. H. E. Coffin, our vice-president, for years the chief designer of the Thomas Companies. He is recognized as the leading automobile designer in America.

Mr. Coffin made two trips to Europe, to combine in this car the best foreign features with the best American. He has thus made it the typical car of to-day.

The lines are handsome, yet conservative. The car follows, in this respect, the leading cars of the year. The finish and upholstery are the same as are found in cars costing double this price.

The wheel base is 110 inches—compare that with rival cars. We have only a 2-inch longer base in our \$2,750 car. The frame of the Chalmers-Detroit is exactly the same as in our Detroit-Forty.

Thus we give you a roomy and elegant five-passenger car—not a car that looks cheap because small.

Weight 2,000 pounds, which means a low tire cost, a low cost of upkeep. Power 24-30 h. p.—sufficient for any requirement. Speed 45 to 50 miles per hour.

Now let us compare the mechanical features with some high-priced cars.

The four cylinders are cast together, as in the latest Fiat, the Darracq, and a score of great foreign cars. Our factory cost on this engine alone is \$261. Yet 4-cylinder automobile engines are sold as low as \$75.

We use the Unit Power Plant, as in the new Decauville, the Motobloc and others. Motor, clutch and transmission form a single unit, so they cannot get out of alignment.

The body is suspended, for easy riding, after the style of the Mercedes. The valves are like those of the Napier. The 4 Elliptic Springs are like the Renault and others.

Low-priced cars are not new; there will be more this year than ever. Rivals may follow us with four-cylinder cars costing even less than this.

But the novelty lies in a car that you can take pride in—a large and luxurious car—a perfect and powerful car—selling at a price like this.

There we have no competition. Not a car selling within \$500 of our price can stand for a moment in actual comparison with the Chalmers-Detroit.

Ready for delivery July 1—catalogs ready now.

Selective sliding gear transmission; three speeds forward and reverse. Perfect dust protection.

As completely fitted with annular ball bearings as the Mercedes, Hotchkiss and Renault. Very few of the costliest American cars use so many. The actual cost of the ball bearings in this car is \$103.

Brakes heavier than we used, until this year, on our "Forty." Anti-backing device to protect you on hills. Double ignition system.

The lubrication system which is now used on the "Forty" and which is being adopted on all leading cars. A multiple disc clutch—similar to that used on the Isotta, Fiat and many others. The gas intake is water-jacketed to save you the trouble of a rising through cold gasoline.

Floating type rear axle, used heretofore only on the highest-priced cars. Wheels 32 inches; tires 3 1/2 inches.

So simple in control that a novice can master the car in ten minutes.

Compare these features, one by one, with the costliest cars. You will note we have stinted nowhere. We did not start out to make this a cheap car.

Then compare the same features with other low-priced cars, and you will see why we have no competition.

Please send us this coupon now for our catalog. The cars are almost ready. Our contracts for materials are only sufficient for 2,500 cars. After that the price must advance if materials advance. So please get the facts at once, so as to decide if you want one.

Chalmers-Detroit Motor Co., Detroit, Mich.

Makers of the Thomas-Detroit Forty
Now called the Chalmers-Detroit Forty

HUGH CHALMERS, President
Successors to E. R. Thomas-Detroit Co.

This change in name involves no change in ownership, personnel or management. It is simply made to avoid the confusion of two Thomas concerns operating on separate lines.

WINTON

The Winton Six-Teen-Six runs all the time "like coasting down hill." Low motor speed for ordinary work, giving splendid reserve power for a brilliant burst of speed or a conquering hill-climb. Overlapped power strokes give constant tension on driving mechanism, eliminate jerks and shocks, and say good-bye to the repair bills and tire expenses that go with four-cylinder motor cars. Goes the route on top gear. Quiet engine—simple, and perfectly housed. Rides luxuriously. Plenty of room for seven. Starts from the seat on compressed air.

STROMBERG CARBURETER

FORMERLY KNOWN AS "THE GOLDBERG"

The name has been changed, but not the carbureter, which remains in each and every detail the same as heretofore.

**SAME
GUARANTEE**

SAME CARBURETER

**SAME
OFFER**

"We sell these carbureters under a positive guarantee as to material and workmanship, and any part or parts proving defective at any time will be repaired or replaced free of charge upon return of such part or parts to our factory. It is further guaranteed that this carbureter will operate satisfactorily upon your motor when properly installed and adjusted to the same, and if it does not, after a trial of 30 days, you have the privilege of returning it, when we will refund the purchase price."

**"TRY
ONE

W.M. R. JOHNSTON, Manager.

No car will last long without perfect lubrication

Perfect lubrication means long life to the bearings and positive assurance all the moving parts are working smoothly and in harmony. Without a PERFECT LUBRICANT no satisfactory results can be obtained.

For over twenty-five years KEYSTONE GREASE has withstood the most exhaustive tests. It is endorsed by the leading manufacturers, mechanical engineers and owners throughout the civilized world, and is justly recognized as the WORLD'S GREATEST LUBRICANT

ONE POUND of KEYSTONE GREASE will outwear 3 to 4 lbs. of any other grease or lubricating compound (barring none).

ONE POUND of KEYSTONE GREASE will outlast 4 to 6 gal. of any lubricating oil (barring none).

KEYSTONE GREASE can always be depended upon to give perfect satisfaction.

Its natural density never changes with variations of temperature. We guarantee that it won't "thin out" or "thicken up." In the Cobalt Mining districts, where it is often 40° below zero, KEYSTONE is universally specified. In the Canal zone, where the BEST is required, the U. S. Government specify KEYSTONE.

KEYSTONE GREASE

KEYSTONE GREASE

can be used on every bearing of your Automobile or Motor Boat except in the cylinders. Automobile users will find every can containing the genuine KEYSTONE GREASE bears the imprint of our registered Keystone trade-mark and the firm name. KEYSTONE GREASE may be purchased through any Automobile Supply Dealer or Garage, or direct from our branch offices enumerated below. Prices quoted on request.

SPECIAL OFFER

To Supply Dealers and Garages for limited time only. Write To-Day.

This Company has no connection with the Oil Trust.
